THE BUILDING NEWS

AND ENGINEERING JOURNAL.

ESTIMATION OF COSTS.

THE cost of building depends on so many factors that it would be unfair to charge the architect with any intention of increasing the expenditure. The locality, rate of wages, cost of materials, and accommodation are among the chief factors of expenditure. They cannot be easily altered, and they affect primarily the expenditure. The architect is responsible for style and expensive ornamentation which may add considerably to the cost, as he may be continually proposing alterations, better materials, and fittings. There are times when these may be done judiciously, and for the benefit of the building—when there can be no question about the desirability of any alteration or additions; on the other hand, these suggested modifications may give rise to some doubt on the part of the building owner or promoters, and then the profession have to face the unpleasant inference that the increased cost has been due to the architect. There is the painful implication that it is the architect's interest to increase the cost, as he is paid by a percentage upon the actual cost—a not by any means fair inference to draw. If it is the fact that the greater the cost the larger is the architect's remuneration, it does not follow that a professional adviser would so seriously impair his integrity and honour by increasing the cost of the building by a £10 note with this object in view; but there is the unfortunate inference drawn by the public and those of a low moral standard from the fact.

No doubt the system of architect's remuneration, as we have said, has been prejudicial to the employment of the architect on this ground, and for this very reason it is of the greatest importance that the profession should not by any action on their part encourage this view. We are sure no one of any position in the profession would countenance any suggestion of adding to the cost of a building unless there was real improvement to be made by it; nor, on the other hand, refrain from suggesting any means of saving cost if an easier and better mode of construction presented itself to his mind. Still there are men who lack this higher standard of action, who are inclined to look on the profession as a means of not only making a livelihood, but of getting rich also, and who look on every available source of profit-making as legitimate. They work in the building profession as a commercial business. To this class of practitioners our remarks chiefly apply. The competition system of tendering has led to many irregularities. The ordinary building owner imagines that the lowest tender is a gain, that he reaps the benefit of the rivalry between contending builders who are anxious to get the work; though as a matter of fact he only

gets his *quantum meruit* in the shape either of sound material or labour, or an inferior extra quantity of workmanship. Many have found by dearly-bought experience what a low tender means—scamped work, greater vigilance in superintending the work, extras, and constant bickering. As a matter of fact, treating the low tender as an honest bid, the owner only gets what he pays for, nothing more. So that if an architect advises the acceptance of a higher tender, he does so simply to protect his client, to avoid extras and scamping rather than to increase the cost of the building. The undercut tender is always paid for by inferior materials and workmanship. But it is difficult to convince the average client of the fact. He cannot shake off the idea that it is the architect's fault that the work costs more than he had anticipated. When he employs a builder to put a house or a shop up for him without professional aid, he gets probably a low tender; but he pays for it "through the nose" in other ways. The builder contracts to erect a building that will suit the owner, but does not guarantee it to be the best: he can put just what materials he likes into it, and cut down the labour to the cost. No doubt it is a cheap job in one sense, and a very dear one in another. The builder is master of the situation: he has no drawings or specification or conditions of contract to consider, so he can do the work at less cost than a contractor who executes a regular contract under an architect. In this connection the subject of quantities suggests a few reflections. We have heard it said over and over again that a bill of quantities adds to the cost—there is the quantity surveyor's commission to pay; the items are taken full for the purpose of adding to the cost, and the architect is often held responsible for the increased expenditure. There may be reason for these objections if the document has been imperfectly prepared: as, for instance, when the surveyor, to cover his ignorance of the architect's intentions, adds to the measurements, puts on more labour, and "loads" the items; but if prepared by a competent man under the architect's supervision, the contrary is the fact. Just so much material and labour are taken as are necessary, and the builder, instead of guessing, is on safe grounds, and is not likely to add a percentage or take the work full to allow for omissions, as he often does when he takes off his own quantities. The cause of wide tendering is largely due to allowances made for discrepancies, to full measurements which one or two tenderers may discover. The practice of some surveyors is to take the quantities full, to cover omissions and mistakes, in consequence of which the astute builders deduct a certain sum from their priced quantities, and are thereby able to undercut other firms. These are practices which can-

not be justified. But when the quantities are made the basis of the contract, as they should be, any little fullness of dimension is measured, and is balanced against omissions and extras, so that the owner pays only his fair share of the actual work. When correctly taken, there can be no excuse for random tenders, lumping items that are not known, adding a percentage for contingencies, and so on. The bill of quantities or a schedule of prices agreed to between the architect and builder is the only honest way of finding the cost of a building. As we have said often before, the architect, as agent for the employer, had better not be engaged in quantities for his own building. We have often heard it said that he increases the cost by having quantities prepared; that when he takes off his own he is interested in making it full. We do not think so. We believe builders prefer tendering when quantities are prepared, and are more likely to tender low when they know they are correct. But the connection of the architect with the financial arrangements is questionable, and if he takes off his own quantities there will always be unsatisfactory remarks made and inferences drawn. All questions relating to expenditure are likely to be misinterpreted in the wrong light. The architect who is really conscientious and desires to spend his client's money to the best advantage, and to give him the greatest value, is often regarded as extravagant and is placed in the same category as the man who has run up the cost of the work in extravagant decoration and appointments, just for the sake of enrolment. Of course, such a conclusion is extremely unfair and aggravating. It is very easy to spend several hundreds, or even thousands, of pounds on a building in the shape of extravagant material and ornament, without making it a penny the better, for the material and display may be thrown away where they are not wanted. It is this class of expenditure that it is well for the architect not to encourage. Hundreds of pounds thrown away on stone carving on the top of a façade where it is not seen, and will soon decay or become black with soot, or on an elaborate ceiling design which is unnecessarily redundant in detail, or making a room larger than it need have been, or in ordering elaborate woodwork and electric-light fittings where a plainer design would be more in keeping, are instances of what we mean. Men who do these things have a poor sense of proportion in values; they throw away large sums on marble shafts and exuberant carving where they are not wanted, while at the same time other parts of the structure are reduced to the barest walls and the roughest makeshifts tolerated, only worthy of a factory or shed. The misapplication and misplacement of decoration and costly fittings are responsible for the unnecessary cost of many of our large

public and private buildings. The client and the tradesmen employed are often to blame; but the architect's duty is to protest against needless and tasteless ornament. He should be resolute, as his too ready compliance may easily render him answerable for the expense and for extras. It is so easy to be persuaded to select a more expensive material than that specified, or a more ornamental design for a ceiling, wall lining, or a mosaic floor. The manufacturing firm is only doing business in recommending a better material or a richer design, which there is always a temptation to accept if the extra cost is not great. It is in this way that the expenditure is increased without any appreciable advantage to the design. The client is not sufficiently acquainted with the advantages of any such alteration or addition to offer any opposition, but implicitly relies on his professional adviser, so that the responsibility of extra cost falls ultimately on the architect. He is blamed for the increased cost. The professional man adds much to his responsibility by a readiness to suggest improvements, and to recommend his client to order extras. Once the contract is settled, and the drawings and specifications made, the architect should be very wary of making any alteration that he can possibly avoid after the work has commenced. Even the setting back of a building may entail extra labour for excavation and concrete, and an excuse for making other costly alterations. The temptation to raise the height of a story is sometimes strong; there is a good reason, perhaps, why a foot or two more would considerably improve the rooms, and add to the importance of the building, and if money was unlimited, the suggestion might be carried out with advantage; but when the cost has been fixed, the architect would be exceeding his duty to make such an alteration or to suggest it to his client, if it was not absolutely essential. Having decided upon the requirements and accommodation to be provided by a set of plans for a building to cost a certain amount which has been approved by a client, it is bad policy for the architect to begin to point out to his client how it can be improved or enlarged and embellished, or for him to acquiesce in all the client wishes to satisfy his passing whims and taste. We know by experience what such alterations and additions run up to, how the whole contract is jeopardised, and how it enables the contractor to run into "extras" for a variety of things to make the contract pay.

The instructions issued to architects who enter into competition are often vague and unsatisfactory. Frequently a sum is stated with the proviso that no design whose estimate exceeds by a certain percentage—often ten per cent.—the specified sum will be accepted: an absurd condition, inasmuch as if the design be the best on the whole, it should be selected. It is better to state the extreme limit, and ask each competitor to submit an estimate of the cost, and to give the cubic contents of his design, and how he has calculated the same, so that a fair comparison may be made. The rate per cubic foot cannot be fairly made the test unless certain rules are followed as to the measurement. Therefore every competitor should be required to show how he calculated his cubic feet, and the rate per foot. Whether the sum given is inclusive of fittings, heating and ventilation, fencing the site, &c., should be made quite clear by each competitor giving separate estimates for these. It is much safer to make the cubic contents relate exclusively to the building without the above appointments, and to state the extra cost of heating, ventilation, fittings, and decoration, and this is the plan that has been adopted in several competitions of late, including the instructions to competing architects drawn up by Mr. Aston Webb, R.A., for the Hammersmith New Central Library. Estimates for buildings are often ambiguous on

these points, or whether inclusive or exclusive of the cost of furnishing, decoration, heating, and ventilation. These items are considerable. The fittings of a town-hall and public offices, including those of the council chamber and magistrate's court, form a considerable percentage on the total cost. To take the furniture and fittings of an ordinary school, the cost is found to vary between 10s. and 12s. or more per scholar, or 4 per cent. on the cost of building. Heating a public building with boilers, pipes, and radiators may cost from £3 to £4 per 1,000c.ft., so that for a building like a public library estimated at £10,000 the cost would be at least £600, a considerable item to add to the estimate. The average client who knows little of building has the idea that the architect's estimate should include everything, all fittings, heating and ventilation; hence we have so many misunderstandings when the accounts are sent in, or when a large sum for what is looked upon as "extras" has to be paid. The Englishman has a strong feeling for knowing the whole cost, and he likes his tradesman or his professional man to give inclusive estimates. For certain kinds of building it would be desirable if the architect comprised within his estimate all the trades that are necessary to produce a complete building. These should include all fittings, lifts, hot-water apparatus and ventilation, electric lighting, and other installations; the difficulty of course is in the obtaining tenders for these things from the various trades or subcontractors. The subject of cost includes chiefly the methods of measurement and calculation which the architect is seldom very expert in. While he may have a good general knowledge of the rates per foot cube for several kinds of building, he is often deficient in regard to the special trades to which we have referred. For this purpose carefully selected data of the actual cost of such things, and the proportion or ratio they bear to the whole cost of the building, or the cost per head, per unit of floor space, or say the cost per 1,000c.ft., are desirable. Just as the architect should be able, roughly, to say what percentage of the total cost the work of any particular trade, say, that of the bricklayer and mason or the carpenter and joiner would be; he should be able to estimate approximately the cost of seating a hall or a church, of the desks and benches for a school, the heating and ventilation. This knowledge of the proportional value of distinct trades is more important now than formerly, as each trade is carried on by firms who have made it a special study. We know of few aids to this kind of estimation for special branches. The professional man ought to make himself acquainted with these helps to estimation that he may be able when necessary to give a complete idea of the expenditure. The chief aim of the profession in this matter should be to give to his client a straightforward idea of cost, so that he may not find the sum greatly exceeded. After providing for everything necessary in the building, he should not reopen the question with proposals to improve it by adding to the expenditure, as many architects are apt to do. The profession will find that their best and wisest policy is to carry out their buildings within their estimates as far as they can, and not to give occasion to the enemy to throw the often-repeated charge that the architect's building is always expensive, and the cost greatly in excess of the sum originally intended to be spent.

BUILDING BY-LAWS IN RURAL DISTRICTS.

THE efforts that have been made of late years to limit the official control of private buildings in rural districts are reasonable, and cannot fail to evoke attention.

Some time ago we commented favourably on the set of model by-laws for rural districts, which the Local Government Board issued, having this end in view. We pointed out how country houses, farm and agricultural buildings, and dwellings for the working classes were subjected to unnecessary by-laws, the actual need for which did not apply, however useful they might be in urban districts. We are glad to see that the question has not been allowed to drop. The Building By-Laws Reform Association has been formed to prevent any unnecessary interference with owners and others interested in rural buildings, and the letter of Mr. R. A. Read, the hon. sec. of the Association, we printed last week, will be read with interest by all building owners who desire to be freed from unnecessary official regulations. Of course it will be undesirable to provide a cut and dried set of by-laws for all rural districts, and the Board leave to the several districts in each case what by-laws, if any, they will propose to make, which will depend on the circumstances. In some districts, which are rapidly growing in extent and density, the by-laws will necessarily be more numerous and strict than would be required for a small rural area. The model by-laws issued in 1901 observed: "Portions of many rural districts are distinctly urban in character, and the development of building is constantly changing the aspect of the country, and it devolves on the rural district councils to endeavour to apply to the several parts of their districts such regulations as the circumstances may from time to time require." No one will doubt the desirability of such action. In one part where the buildings are sparse and simple, with large areas of land around them and thinly inhabited, the precautions necessary would be few, and only have reference to matters affecting health, such as the foundations and walls of new buildings, sufficiency of space about them to secure air-circulation, drainage, closets and ashpits, cesspools. In another part of the district which is assuming an urban character, where the buildings are closer together, it may be desirable to introduce clauses dealing with construction, the prevention of fire, and the level and width of new streets. According to the density of the populated areas, it will be necessary to legislate. In fact, each part of the district should select those clauses from the model series that are appropriate to the requirements of the district, or a portion of it. While regulations in the interest of public health are necessary, the by-laws and regulations in many districts go beyond these needs. The Reform Association, in its articles of constitution, while recognising the value of regulations on the above ground, is endeavouring to resist unreasonable encroachments upon the liberty of the individual, who is often unable to do anything by himself. The Association is turning its attention to the task of getting the old, unreasonable by-laws amended, in rural districts especially, and it points out that these oppressive by-laws are exercising an injurious influence upon the provision of dwellings for the working classes, and it is thought that, by removing unnecessary restrictions, an impetus will be given to the erection of new cottages so greatly needed in many districts. The amendment of by-laws in urban districts will also be considered by the Association. We believe many in the profession will join in the endeavour to secure more consistent measures. There are many districts of a rural character where very restrictive and oppressive clauses are in operation. We might mention several of the districts near our seaside resorts where by-laws are in force against hollow walls, half-timbered and stucco, or tile-hung gables, oversailing of all kinds, the erection of external features to small villas. We know there has been a great outcry about such interferences with private

property; architects and builders have complained of the restrictive regulations which many local authorities enforce under penalty, and the authorities would be aiding the development of their locality by obtaining amendment of these by-laws.

To refer in detail to some of the model by-laws issued by the Local Government Board. The prefixed memorandum states that rural district councils are not directly authorised to make by-laws, but can obtain power by adopting Part III. of the Act, 1890, under section 23, on certain subjects which are enumerated, and which refer mainly to structural matters which affect health, drainage, ventilation, air space about buildings, height of rooms, &c. Of the model series issued, by-law 2 exempts certain buildings from the by-laws. Special attention is drawn to subdivision (h), which runs as follows:—"Any building which shall not be a public building or a building of the warehouse class, and shall not be constructed or adapted to be used either wholly or partly for human habitation, or as a place of habitual employment for any person in any manufacturing trade or business, and which, if intended for use as a pigsty or a cowhouse, shall be detached from any dwelling-house." The effect of this clause is "practically to exclude from the operation of the by-laws all buildings which are not dwelling houses or used wholly or partly for human habitation, or as a place for the habitual employment of any person." Thus, agricultural buildings, out-buildings, plant-houses, summerhouses, poultry houses, tool houses are unrestricted, except that they should not encroach on the open space required for new domestic buildings. If not detached from a dwelling-house, even a pigsty and cowshed come within the operation of the law. Public buildings and warehouses are also included, though the provisions in respect of them are few. We have referred to the by-laws proposed: these briefly relate to a layer of cement concrete on site of every new building, dampcourses, walls impervious to moisture below the ground level, or double walls—all of which are structural requirements no one will object to.

Clauses 6 and 7 are perhaps more open to objection in country districts. These deal with the provision of a proper space about buildings to secure a free circulation of air. The by-law is framed to meet the case of houses fronting narrow roads, which in the country cannot possibly be avoided in many cases. It may be considered a vexatious rule that where a house is built facing a street less than 24ft. wide it should be made to set back to a distance of 12ft. from the centre of street. It is still more objectionable that no projection such as a gable or bay window is to encroach on the open space provided. By-law 7 seems almost unnecessary in open country districts where the house is built close to an open field or space. In urban districts it is desirable that every building should have in the rear an open space exclusively belonging to the building of at least 150sq.ft., and free from any erection except a closet or ashpit; but in the country the by-law may restrict many building operations, and the cottage builder might find it impossible in every case to obtain an area of that extent behind, although the cottages may abut on a large field or park. The other sub-clauses which regulate the width of open spaces according to the height of building seem almost, for the same reasons, unnecessary. Although by-laws 8 to 12, dealing with the ventilation of buildings, do not impose any restrictions on the position or shape of windows or fireplaces, they are likely to be used to restrict the architect's freedom of design. A troublesome surveyor or official may, for example, contend that the rooms of a new domestic building are insufficiently lighted, that "a sufficient number

of suitable windows in such a manner and in such a position" as described in by-law 8, has not been provided, or that they do not afford effectual means of ventilation. Clause 9 may be also quoted to prevent certain windows being introduced because of being a few inches less in area than one-tenth of the floor area of a room, or that one half of the window does not open. At least, we may imagine cases where the surveyor might make any of these requirements an excuse for not passing plans that were otherwise excellent in themselves. A technical objection might also be raised under by-law 10 in regard to a clear space of 3in. between the under side of every joist and the upper surface of the ground or concrete; a trifling half an inch less may be urged to warrant non-compliance. We think these by-laws 8 to 11 may be amended with advantage in the case of rural districts where there is ample light and air. The provision of a flue or air-shaft to every habitable room that has not a fireplace, equal in sectional area to 50 square inches or about 7in. square, imposes a condition that would be unnecessary in large rooms ventilated by the door and windows.

It is needless to enter into other parts of the by-laws referring to drainage. The drainage of the subsoil of a new building is essential to health, but for dry soils it is not necessary. Other by-laws relating to closets, ashpits, and cesspools are necessary in the interests of health, and we cannot take exception to them; but even these provisions ought to be modified to suit each district. Under by-law 43 the authorities will have ample opportunity of enforcing necessary conditions in buildings intended for human habitation, for it gives them power to close any building they think unfit for such purpose. Local authorities have the opportunities for drafting any by-laws that are specially necessary, and the procedure is pointed out. Any by-laws proposed must be submitted to the Board in the first instance in draft for their approval, and draft forms for this purpose are obtainable. Where building by-laws or regulations are in force, and give dissatisfaction, the local authorities are responsible, and they should endeavour to propose amendments with the object of simplifying them, so that the official regulation of private buildings may be limited to the demands of public health and safety. The Association we have mentioned assists authorities in such action, and also in the adoption of new by-laws that will not sacrifice the liberty of individual owners. The architectural profession are directly interested in such a measure of reform. Their hands are much tied by urban regulations, and official interference. In country districts, where they have hitherto been free from restrictions upon their designs, they naturally look for exemption from laws which have reference to a totally different set of conditions and surroundings.

WEIGHT-BEARING STRAIN OF THE CONYER STOCK BRICK.

MESSRS. EASTWOOD AND CO., LTD., of Belvedere-road, Lambeth, S.E., in their fresh issue of Press notices referring to their new system of brickmaking as carried on in their Kent brickfields, to which we lately drew special attention, invite particular notice to the important results of experiments made by David Kirkaldy and Son, at their testing and experimenting works, to ascertain the resistance to a gradually increased thrusting stress of six bricks, machine made and hand made, supplied by them. The tabular results must be examined by our own readers for the actual figures. Six of the stock bricks subjected to these tests were the special bricks made by the new process or machine, dried in dryer, and burnt in kiln; the other six bricks were ordinary hand made. The six hand-made stock bricks, which we take first, slightly varied in thickness, length, and width; but the mean base area was 37.39sq.in. The stress in pounds is given in

three columns, headed "Cracked Slightly," "Cracked Generally," and "Crushed." The highest results under the first head is 76,600lb., the lowest 44,120lb., while looking at the last or "Crushed" column 96,420lb. is given as the highest, and 52,260lb. as the lowest results. The mean stress in the first column is 57,236lb., and the mean of the latter 73,260lb., representing tons per square foot in each case as 98.3 and 125.9. The bricks were bedded between pieces of pine 3in. thick and the recess filled with cement. The results of the tests with the six stock bricks made by the new process and kiln burnt are remarkable evidences of the greater strength and cohesiveness of these bricks. Let us take the same figures from the table: the base area had a mean of 37.15sq.in., rather smaller than the former. Taking the "cracked slightly" we have for the highest result 93,600lb., the lowest 71,400lb. Under the "crushed" column 134,300lb. and 88,600lb. respectively, giving a mean of 85,067lb. for the former, and 112,433lb. in the "crushed" column, or in tons per square foot of 147.3 for "cracked slightly," and 194.7 for "crushed." The net result therefore is that the Conyer stock made by machine, dried in dryer and kiln-burnt, has a weight-bearing strain of 194.7 tons per square foot, and the ordinary hand-made stock 125.9 tons per square foot, giving the remarkable increase of 68.3 p.c. in the strength of the stock brick made by the new process. We think our practical readers will say this is a very important gain in crushing strength. The experiments to ascertain the porosity of three bricks of the improved make show a mean absorption of 7.83 per cent. These results are valuable additions to our tables of the strength and porosity of stock brick, and must be very gratifying to this company.

ON BUILDING TIMBERS.—XXIX.

RED PINE (P. RESINOSA) AND YELLOW PINE (P. STROBUS).

THE wholesale prices of First Quality red pine deals are 4in. and 6in. by 9in. and 11in., £14 15s. per Petersburg standard; 4in. by 9in. and 11in., £12 10s.; 4in. by 8in., £10 10s.; 4in. by 7in., £9 15s.; 3in. by 11in., £12 5s.; 3in. by 9in. and 10in., £16 15s.; 3in. by 10in., £16 10s.; 3in. by 9in., £12 10s. to £16 15s.; 3in. by 8in., £9 10s. to £13 15s.; 3in. by 7in., £8 15s. to £13 5s.; 3in. by 4in. and 4½in., £8 15s.; 2½in. by 9in., £15 15s.; 2in. by 7in. and 8in., £8 17s.; 1½in. by 11in., £16 15s. to £18; 1½in. by 10in., £14 10s.; 1½in. by 8in., £13; 1½in. by 7in., £12 15s.; 1in. by 11in., £16 5s.; 1in. by 10in., £13 15s.; 1in. by 9in., £15; 1in. by 8in., £12 10s.; 1in. by 7in., £12 15s. Second Quality, 3in. by 11in., are worth £11 15s.; 4in. by 9in., £10 5s.; 4in. by 11in., £10 15s. There are other qualities, known in the trade as "A," "B," and "C," 3in. by 11in. "A" quality are worth £9; 3in. by 9in., £10 5s.; and 1in. by 9in., £9 to £9 5s. Although the Quebec standard hundred is one of 100 deals 12ft. by 11in. by 2½in., all Canadian deals are sold in London by the Petersburg standard hundred of 120 deals 12ft. by 11in. by 1½in. The real London (and Dublin) standard hundred is one of 120 deals 12ft. by 9in. by 3in.; Christiania 120 deals 11ft. by 9in. by 1½in.; and the Dram hundred 120 deals 9ft. long by 6½in. by 2½in. Converted into cubic feet and "Board Measure," these are respectively Petersburg 165c.ft.—1,980B.M.; London and Dublin, 270c.ft.—3,240B.M.; Christiania, 103½c.ft.—1,237½B.M.; Dram, 121½c.ft.—1,462½B.M.; and Quebec, 229½c.ft.—2,750B.M. All building timber is squared up to Board Measure in America, the standard being 12in. by 12in. by 1in. or 1ft. square 1in. thick; hence the English cube foot is equivalent to 12ft. American "Board Measure." From the figures given above it will be seen that First Quality Red Pine varies in price according to condition, length, and other dimensions, from 2s. 0½d. per cube foot down to 1s. 1d.; Second Quality, from 1s. 5d. to about 1s. 3d. for boards; Third Quality, from 1s. 6d. to 1s., and unsorted from 1s. 2½d. to 11d. "A" quality is worth about 1s. 0½d. Canadian pine, red or yellow, is measured in log by some one of the following methods:—(1) The full contents without deduction of any kind for faults; (2) such logs only to be measured which are sound and fairly made, with gum seams closed at the butt, sound knots not to be noticed and lengths under "merchantable" standard if

they are not under 12ft. long, are to be included; or (3) the logs are to be selected (culled) and measured in a merchantable state, according to the inspection rules. In culling, "M" is merchantable timber, the letter being stamped in the end of the log; "U," sound and merchantable, but under merchantable size; "S," second quality, "T," third quality, and "R," rejected and unmerchantable. Square Red Pine timber must be free from rot, rotten knots (a rotten knot is one which is so decayed as to affect the surrounding wood), worm-holes, shakes, and splits; but sound knots are not objected to. Lathwood is cut in lengths from 3 to 6ft., free from rot; it must split freely, and each billet may contain three or four open case-knots so long as they line with each other, and the billet may have one twist in the length, but no more. Pine boards must be 10ft. in length and over, not less than 1in. thick or 7in. broad; they show an equal width from end to end, edged with a saw, and trimmed to a straight line: each board must be the same thickness from end to end, and all the boards shall be free from rot, bad knots, rents, and shakes. No board is rejected on account of the sawwood in it, whether it is blue or dried light in colour like heartwood. All red-pine deals to be merchantable (marked "I"), shall be free from rot, rotten knots, grub worm-holes, open case-knots, and splits. Small sound knots and heartshake will be allowed if the latter does not run far into the deal, or form a split through at the ends. They shall be free (or nearly so) from black or dead sap; but sound sap on the corners or on a portion of one face of a deal is not objected to. This description of a first quality red deal should interest the architect and surveyor, for it will be seen that a certain quantity of "black" sap may be present, and "second" sap is in no way objectionable. The distinction between the two kinds of sawwood is a subtle one, for though patent to the eye, still one is quite as objectionable as the other in any piece of wood exposed to the weather. It cannot be too strongly urged on clerks of works and building foremen that the colour of sawwood in no way affects its weathering qualities. Both sound sawwood and black sawwood have the same objectionable constituents, and these invariably lead to rapid decay of the wood in presence of moisture. Second quality, red pine deals (marked "II"), are those which are not up to the standard of "merchantable," and are better than "Culls" (marked "X"), the best deals not good enough to be seconds, and too good to be "Culls," are Third Quality (marked "III"). Deals of all these (fine) qualities shall not be less than 8ft. long, 7in. broad, and 2½in. thick; deal ends are not less than 6ft. long; the deals must be well sawn and squared on the ends with a saw, and colour alone does not in any way affect the quality of a deal. Red Pine logs are not less than 20ft. long by 10in. by 10in. in the middle, and 20ft. long and up, if 12in. by 12in. or more in the middle. Red Pine logs can taper 2in. in every 25ft., and have a curve or hollow of 3in. in 20ft. The rules provide that the culler shall have logs and deals properly chopped or dressed before they are certified as merchantable in every case where they are improperly hewn, squared, butted, or edged, even though they are merchantable in every other respect.

YELLOW PINE.

The timber known as "Yellow Pine" in England is the White Pine of the United States and Canada. It is called Weymouth Pine, Soft Pine, Northern Pine, and Spruce Pine, its botanical names being *Pinus Strobus* and *Pinus Pennsylvanica*. This pine is lucky in having fewer names, botanical and local, than any other pine found growing on the American Continent! This is the "Northern Pine," as the Pitch Pine is the "Southern Pine," and the individuality of the timber is so marked that it cannot possibly be mistaken for that of any other species, as the latter is frequently, and this is an immense advantage to the profession in general, for American architects specify "Southern Pine," and our architects specify "pitch pine," not knowing that the wood of five different trees can be supplied under these names, and all having the greatest range in qualities, for American architects will often specify "Georgia Pine," and then refuse to look at Texas or North Carolina pine, although the same wood and the same quality are included under all these names! Practical men, the knowing ones in the trade, deal in

Long-leaf Pine "from Arkansas," where the tree known by that name never grew, and men who have all their lives been engaged in sawing timber in the States execute their orders for Long-leaf Pine with either of the other varieties, overlooking the differences or being wholly ignorant of them. There are different kinds of sawn timber common in the trade of the United States called by specific names. Yet few people understand that they may all be derived from the same species of tree, and the same wood in every respect, but none of this confusion attends the use of what the Americans call "White Pine," for the wood is unmistakable wherever it is found, and no matter where it came from.

A number of closely-related pines, found in the United States, and others in Europe and Asia, have mild-working wood, similar to the well-known yellow pine; but none of these have as yet displaced that grown in the Northern States and in the Great Lake region of Canada. The white pine of the Rocky Mountains (*Pinus Flexilis*) is one of these; the sugar pine of the Pacific coast another (*Pinus Lambertiana*). Other "colourable imitations" of yellow pine are *P. Monticola*, *P. Albicanis*, *P. Stroboformis*, *P. Quadrifolia*, *P. Parryana*, and *P. Cembra*—all found in the States. The stone pine of Switzerland (*P. Cembra*) and the Bhotan pine of India (*P. Excelsa*) are all of the same species. All these trees have slender, delicate leaves, five in a sheath, and wood of even texture, the whole, no doubt, having descended from a common ancestor. The yellow pine has a small root development, generally near the surface, so that it depends less on the soil for its growth than the atmosphere; and when it is grown in the open, as it frequently is in England, there is a tendency to throw out branches, or "to fork," as it is called, near the ground, to protect the roots from intense cold in winter and undue evaporation in summer. The wood of Yellow Pine is softer, and has much less "hard grain" than either red pine or pitch pine: it is also of more uniform texture than any Baltic or White Sea wood. It has been explained in previous articles that the stem, bole, or trunk of a tree is made up of a number of annual rings, each of which consists of two kinds of wood, that portion deposited in the spring being open-celled and soft, and that deposited in the summer, which is narrow-celled and hard, the difference arising from bark pressure, which is least in spring and greatest in summer. Now in yellow pine the transition from spring to summer wood in the annual rings is so gradual as to be almost imperceptible, whilst in all other pines outside this family, especially in the pitch pines, the rings are of two woods of about equal widths, one soft and the other hard, the change from one wood to the other being abrupt, as if the bark, after having been loose on the trunk in spring, suddenly became rigid again in summer, thus allowing no opportunity for the formation of any wood intermediate between the two. Yellow pine has no equal for carving, furniture, and internal joinery, such as door-panels, mouldings, stairs, balusters, and other fittings, where the surface is to be painted, and where great width with an absence from knots is desirable. There is another peculiarity in yellow pine which makes it valuable to the joiner—viz., that in it the resin ducts are smaller and fewer than in the other pines—for instance, in comparing the *Pinus Strobus* with *Pinus Sylvestris* (Baltic redwood) the resin ducts in the bark of the former are to those in the heartwood as 28 to 27, whilst in the latter the proportion is 9 to 37; this makes the yellow pine a wood much easier to be worked than any variety of the other. For 250 years yellow pine has been used for building in the United States, and there it is used for everything of wood in houses from the cellar to the roof, the latter even being covered with it, cut into shingles. American architects adopt this wood as a special favourite on account of its lightness, stiffness, and durability. Yellow pine extends west from Newfoundland and the Atlantic Coast, its northern limit being an irregular line between 49° and 51° of latitude, its greatest northern extension occurring near its western limits. After passing along the south-eastern end of Lake Winnipeg, the boundary line turns southward, closely following the 95° meridian of longitude, skirting the boundary of Wisconsin and Iowa, crossing Northern Illinois; at the head of Lake Michigan, it continues east to the shores of Lake Erie, when it turns in a south-westerly direction along West Virginia and East Tennessee to North Georgia, its south-most limit,

when it turns back again to the Atlantic Coast at New Jersey. Yellow pine is therefore found in Newfoundland, New Brunswick, Nova Scotia, Southern Quebec, Ontario, and Eastern Manitoba, and in the States of Maine, New Hampshire, Massachusetts, Connecticut, Rhode Island, Vermont, New Jersey, New York, Michigan, Wisconsin, Minnesota, Pennsylvania, Western Maryland, West Virginia, East Tennessee, North-West Carolina, and North Georgia; in southern latitudes it is confined to the higher lands. Commercially valuable timber is not found over all this vast area: it is confined chiefly to New Brunswick, Nova Scotia, South-Western Quebec, and Ontario in Canada; and in the States to New York, Pennsylvania, and the northern parts of Minnesota, Wisconsin, and Michigan. In the higher latitudes the Canadian Yellow Pine becomes more and more intermixed with Spruce. There is no wood in the world of which there is a greater quantity used than of yellow pine, and the demand for it is so great that in a few years the existing pine forests will be completely cleared. Indeed, much of the capital invested formerly in the pine industry of the Lake regions has now been transferred to that of the Southern States, Long-leaf Pine attracting what has been withdrawn from Yellow Pine conversion. In Maine the great Northern Pine belt once covered the State, and many of the trees were so magnificently developed, especially in the river valleys, that they gave it the name of "the Pine Tree State." Some of these trees were from 6ft. to 7ft. in diameter and 250ft. high; but these forest giants have long since disappeared—in fact, the virgin trees in this State have been entirely removed. In New Hampshire and New York State the higher altitudes with poor soil, are now stocked with spruce and hardwoods, pines being very poorly developed; in the Adirondacks the Yellow Pine has almost disappeared, and the few specimens left, associate with maple, beech, birch, and spruce in the lower grounds on lake shores and water courses, where they may be seen towering to a height of 50ft. or 60ft. above the general level of all the other trees; indeed, the finest development of this timber is always found along river valleys. As the Yellow Pine extends southwards into the warmer States it is forced on to higher and higher ground, until in North Carolina the wood is of no value whatever for building, when it is found growing below the 2,000ft. contour line above the sea level. Yellow Pine is well developed in the basin of the St. Lawrence and around the Great Lakes, which makes its exportation and shipment economical: hence from parts on the St. Lawrence nearly all this timber is shipped to England, and Michigan, Wisconsin, and Minnesota are known as the great lumber region in the States. Pure pine forest is rare in Canada. North and west from the Ottawa River to Georgia Bay is about the most productive district for yellow pine, and here it is mixed with hardwood, hemlock, spruce, and arbor vitae. In Ontario the pines are scattered and mixed with hardwoods, as in Southern Michigan. Yellow Pine is indigenous to Newfoundland, and here it yields considerable quantities of valuable timber, along its north-western limits pine into prairie or spruce forest. It is estimated that the area of the true home of the Yellow Pine in Canada and the States cannot be less than 400,000 square miles, and over the whole of this it can be cultivated so as to be commercially successful. In the northern United States, as in Canada, the nature of the soil determines the kind of tree grown in it. Sandy soils are favourable to the growth of pines, and in a typical pine forest about half the trees will be yellow pine, less than one-half red pine, and the remainder hemlock. On sandy soils and gravels Red Pine generally displaces Yellow Pine, for the latter thrives best in a moist loamy sand overlying clays, though in places where stiff clay alone is found, sugar maple, birch, and beech displace the pines completely. In Michigan and Wisconsin climate does not affect the distribution of the pines as it does in Minnesota, Red and Yellow Pines, with Tamarack (*Larix laricina*), Arbor Vitae (Cedar, *Thuja Occidentalis*), and Spruce (*Picea Alba*), occupy the swamps and highlands which would be occupied by hardwood elsewhere. All the virgin pine has long since been cut out in Michigan, and the exploitation of the forests which first began in the 17th century by the erection of saw mills in connection with the numerous grist mills found all over the country.

was practically ended so far as the main bulk of the large timber was concerned long before the first steam sawmills were erected at Saginaw in 1834. Yellow Pine was exported from Canada by the first settlers, and to-day the trade done between Canada and the States alone, in pine and spruce logs and deals amount to about one and a half million feet Broad Measure, the whole of which comes from the upper waters of the Ottawa, the shores of Lake Huron (Georgian Bay district), and Lake Superior. About 95 per cent. of the yellow pine now on the market is found cut into lengths of from 12ft. to 18ft., three-fourths of the whole being 16ft., a length, for some reason, preferred in the trade to any other; these lengths are converted into dimension stuff 1in. to 4in and up wide, also into deals and boards, the widths always varying by an even number of inches. Slabs are cut into laths, and the thickest slabs, together with the second portions of defective logs are cut into shingles, in the manufacture of which "knot sawyers" carefully cut out all the knots and decayed wood. In breaking up a log, gang-saws cut it into slices of various thicknesses, and these are subsequently re-sawn by an "Edger," who rectifies the uneven edges, and cuts each one to a standard width. Any flitches in deals found free from knots is called "clean stuff," and others are kept in as large pieces as possible, being of much more value than if cut up into smaller scantlings. The clear stuff or "uppers" rarely forms more than 15 per cent. of the tree at present, all the large clear timber having been cut down and converted long since. The quantity of log timber brought to market is insignificant as compared with that converted into dimension stuff and deals. Dimension stuff is often resawn, after it has left the mill, by small dealers, who buy inferior qualities, and obtain from them flooring and boards of a better class than the stuff from which they are cut! Perfectly clear yellow pine of large dimensions may sell for 3s. per cube foot in the States, and the merchant may retail it at 6s. Such is the demand for it by model-makers and others, at a public sale in London in the early part of this year some dry yellow pine deals brought £32 per standard or about 3s. 6d. per cube foot. Several attempts have been made in the States to substitute other woods for yellow pine in the manufacture of sashes and doors, notably the Cypress (*Taxodium Distichum*) and the White Cedar (*Chamaecyparis Thuyoides*), but the growth of these trees is not extensive enough to warrant their being considered in any way likely to displace yellow pine.

In natural forests, where the trees are crowded together, one shading the other, *Pinus Strobus* grows with a straight trunk without branches for about half the distance between the ground and the top of the leader, but in open spaces it throws out branches within a few feet of the ground; its rate of growth, both in height and diameter, is entirely determined by the size of the crown and the conditions of light to which it may be exposed. The rate of growth in height is rapid after the fifth year, when, up to the tenth year it attains its maximum of 16in. (per annum), this declines gradually up to one hundred, when the rate of growth is reduced to from 6in. to 7in. After 160, when it is only 2in., the growth in height may be said to have ceased, though in some few specimens the leaders have reached 200ft. from the ground. Good merchantable timber can only be obtained from trees 30 or 40 inches in diameter, and these would take 200 years to grow to this size, hence the entire destruction of the pine forest can only be a question of a very few years. The average rates of growth, taking 224 trees, were found to be as follows:—At 50 years, 8.7in. in diameter, 56.7ft. high; 100 years, 17.2in. in diameter, 91.3ft. high; at 150 years, 25in. in diameter, 114.4ft. high; and at 200 years, 31in. in diameter and 129ft. high. The heartwood in trees 100 years old made 55 per cent. of the trunk, sapwood 33 per cent., and bark 12 per cent. The above are trees of dominant growth. An oppressed tree 200 years old would not be more than 112ft. high, with a diameter of 23.5in. Any person accustomed to watch trees in our English woods will have noticed some shoot up far ahead of others, which latter are then kept back by being overshadowed. In American forestry such trees are classed as "dominant," and "oppressed." There is an intermediate variety called "co-dominants," with a rate of growth between the other two. In the classification of sawn yellow pine scantlings or in the "grading" of them, as

the process is called in America, the same rules do not apply to boards an inch thick and to those above that thickness, for inch boards show one face only as a rule, whilst thicker stuff is used for doors and sashes where both faces are exposed; hence thick "uppers" are graded for quality, taking both faces into consideration, whilst for 1in. and thinner "uppers" one face only counts, so that an inch board may be "first clear" on one side, and "third clear" on the other side! In fact, the inspectors are informed that a piece of sawn yellow pine which is "A Select" on one side may be no better than "B Select" on the other, and "B Select" in front may be "C Select" behind. The architect and surveyor will not, of course, recognise these nice distinctions here. The different grades of yellow pine on the American market is astonishing, taking them in order of quality, the best being taken first. There are:—(1) First Clear, (2) Second Clear, (3) Third Clear, (4) A Select, (5) B Select, (6) C Select, (7) Shop Common, (8) Box and Stock Boards, (9) A Stock, (10) B Stock, (11) C Stock, (12) D Stock, (13) 1 Siding and 3/4 Ceiling, (14) No. 1 and No. 2 or A and B Siding, (15) No. 3 or C Siding, (16) No. 4 or D Siding, (17) Fence Siding, (18) 4in. and 6in. flooring, Drop Siding, Ceiling, and Partition, (19) No. 1 and A Flooring, (20) No. 2 or B Flooring, (21) No. 3 or C Flooring, (22) No. 4 or D Flooring, (23) First Common Boards and Fencing, (24) Second Common Boards and Fencing, (25) Third Common Boards and Fencing, (26) Dimension, First Common, (27) Second Common, and (28) Shipping Culls. In the last quality named the wood must be strong enough to be handled without breaking, and the predominating defect is red rot, covering more than half the surface. This grade borders on the absolutely worthless, even for firewood. In Philadelphia there are other grades of yellow pine, such as Shelving or Dressing, Cuts, Moulding, Case Boards, Barn Quality, Clear Fencing, Fencing, Promiscuous Width Fencing, German Siding, Bevel Siding, &c. In Toronto the grades are Clear Lumber, Picks, No. 1 Cutting up, No. 2 Cutting up, Fine Dressing, Common Dressing, Common Strips, Sap Strips, Common Dressing Strips, Common Strips, No. 1 Culls, No. 2 Culls, No. 1 Lath, No. 2 Lath, No. XXX Shingle, No. XX 6in. Clear Butts, and Culls. In Quebec Yellow Pine timber is selected free from rot, rotten knots, worm holes, open shakes and open rings; true sound knots are allowed. Boards are not less than 10ft. long, 7in. by 1in., equally broad from end to end, edged with a saw or trimmed to a straight line, free from rot, bad knots, vents, and shakes. When the architect has made himself thoroughly well acquainted with the various cuttings and gradings of Yellow Pine, he should study the defects in this timber arising from attacks by parasitic organisms. These are all examined and lucidly described in Hartig's "Zersetzungserscheinungen des Holzes." A perusal of this work will bring the reader's knowledge up to date, for a perusal of "Vitruvius," or that "master," Palladio, will not afford him much information about American Yellow Pine, its merits or its defects.

THE CAUSE OF THE CEMENTING VALUE OF ROCK POWDERS.*

IN the course of the investigation of rocks as road-building material, it early became apparent that in addition to the hardness, resistance to wear, and other physical, mechanical, and economical conditions that required consideration, the binding power, or as it has come to be called, the cementing value, was one of the most important factors in deciding as to the nature and value of the material. The description of methods of reducing the materials to powders, the formation from these powders of briquettes under constant pressure, and the subsequent impact testing by which the cementing value is obtained, has already been thoroughly described by Mr. L. W. Page, to whom the development of the study of the cementing value of rocks and the methods of impact testing is due. An outline description of the methods employed is all that is necessary here. The stone or other material is ground in a ball mill until it passes a screen with 40 meshes per centimetre. This sifted powder is then mixed with sufficient water to make a stiff "dough." After standing twenty-four hours,

cylindrical briquettes are made of standard size (25 by 25 millimetre) at a standard pressure of 100 kilogrammes per square centimetre. This is done in a specially designed hydraulic press. The briquettes are then dried in an air-bath at 100°, and tested in an impact machine which delivers a standard blow of 1 kilogramme falling 1 centimetre. The cementing value is measured in this laboratory by the average number of standard blows that a series of briquettes made from a rock powder will stand. It was realised from the beginning of the investigation that the phenomenon of the cementing power of rock dusts was possibly the result of several, if not many, causes. Among those which might be expected to have more or less influence may be mentioned: (1) Solubility, however slight, of the material or of certain ingredients of the material; (2) size and shape of the particles; (3) chemical reactions set up on moistening the powders, as in the cases of Portland cements, mortar, &c.; (4) crystalline forces operating under either (1) or (3), as in the cases of plaster of Paris, mortar, cements; (5) physical nature or condition of the particles and their relations to water: (a) unbound water, (b) hygroscopic water, (c) water of crystallisation, (d) water of constitution or combination. After many experiments in this laboratory, the conclusion was reached that, although the causes put down under the first four headings are to a certain degree operative in many cases, and even perhaps of paramount importance in exceptional ones, it is under the fifth heading that the true cause of cementing power and plasticity must be sought. If a rock powder is ignited at a temperature at which all the water of combination is expelled, the cementing power is invariably totally destroyed. No better indication could be had that the binding power is a function of the combined water, or of some condition of the particles which is invariably accompanied by the presence of combined water. Early in the investigation the idea had suggested itself that there must be a physical difference in the nature of the particles. Powders which cement well must be composed of particles which present to one another more or less "sticky" or adherent surfaces. As a matter of fact, a trained eye can at once detect a powder that is likely to give a high cementing value. A plastic powder when poured on a flat surface will form a more or less cone-shaped heap, while a non-plastic powder, to use the language of the clay-worker, "squats." Most authorities have rejected the notion that water of combination conditions the plasticity, for the simple reason that many totally non-plastic earthy deposits and minerals have a high water content. The difficulty has probably arisen from a failure to distinguish different kinds of water of combination. Experiments by the writer show that plastic powders moulded into briquettes under a given pressure apparently suffer a certain compression which is not shown by the material after the plastic condition has been destroyed by ignition. We have now to inquire if any reason can be found not only for this compression, but for the fact that it seems to accompany the plastic condition. Compressibility may be conditioned by (1) porosity and plasticity of the particles which would allow of their being "squeezed" into closer contact and configuration; (2) shape and size of the particles governing their resistance to close contact and the inclosure of voids. In this work it was found that the ignited powder always contained a much larger proportion of impalpably fine dust than the raw hydrated powders. This is shown not only by microscopic examinations, but proved by dropping the respective powders into water, when it is easily seen that the former contains a greater proportion of fine material which remains longer in suspension. It is conceivable that a hydrated material may possess a porosity so fine that the magnitude of the interstitial spaces is submicroscopic, perhaps not far removed from that of the water molecules themselves. The heating by ignition of a powder consisting of such hydrated particles would have a bursting or disrupting effect upon the particles, which would thus fall down to a mere impalpable dust. In order to investigate the effect of size of particle on the volume of briquettes it was decided to prepare glass powders of different degrees of fineness. A quantity of the best French plate-glass was accordingly powdered in the ball mill and sifted through a 0.25-millimetre mesh screen. A quantity of the sifted powder was shaken up with a large excess of distilled water, and allowed to

* Abstract of a paper by ALBERTON S. CUSHMAN, in the *Journal of the American Chemical Society*.

settle for ten minutes. The portion in suspension was then decanted to another vessel and allowed to settle again for thirty minutes; the decantation was then repeated, and the third or finest portion allowed to settle completely. The three portions were thoroughly dried in an air-bath, and the three powders examined under a high-power microscope fitted with a micrometer eyepiece, with a view to getting some notion of the comparative size of the particles in the respective samples. As the size of the different particles was in no case uniform, the best that could be done was to measure the largest particle that presented itself in each field, and then select one that seemed more nearly to represent an average; 20-gramme briquettes were then made from each of the three powders, and carefully measured. The extreme compression observed between the minimum and maximum volume in these glass briquettes is 2.5 millimetre, this corresponds to a calculated difference of 0.7 of a unit in the specific gravity. That is to say, if the powder had a specific gravity equal to 2.5, the finest would have to have a specific gravity equal to 1.8 in order to account for the variations. It is impossible to believe that such a homogeneous material as plate glass could be separated into portions of such widely different gravities, and, moreover, in spite of the difficulties attending the determination of the specific gravity of very fine powders, such wide differences could not escape experimental detection. As a matter of fact, determinations carefully carried out showed little or no deviations in specific gravity. The question then is, how are we to explain these results? As far as the writer is aware there is little information available in the literature on the volume relations of fine powders under given pressures. If the glass is crushed to fragments these fragments can be compressed to a certain degree by a given pressure; if we break these fragments still smaller, the resulting fragments, however tiny, are made up of particles arranged in more compact order and in less space than they could be arranged again if once set free. From purely theoretical consideration, therefore, we may say that in reducing the fineness of a powder we are approaching an ideal condition of unit particles which cannot be forced by any ordinary pressures into the same space they occupied as part of fused masses. Turning again to the results on rock powders we are led to the conclusion that the driving off of water of combination breaks up the particles to a finer dust, also that this destruction of the particles leads to loss of plasticity. As there were on hand in this laboratory a large number of thoroughly air-dried samples of rock powders and clays, of which the cementing value was known, it was decided to determine the water content of these, with a view to seeing if indeed any relation could be traced between cementing value and water of combination. The determinations were made by igniting the powders in a platinum boat contained in a hard glass tube and absorbing the water set free in a weighed sulphuric-acid bulb-tube. An inspection of the results shows that high cementing values have a decided tendency to accompany a high water content. At the same time, there are several exceptions revealed, and it is probable that an even greater number of results would show other discrepancies, as it is well known that many minerals with high water content do not yield plastic powders. On the other hand, if a certain kind of water of combination invariably accompanies the plastic condition, this active water would be added to the inactive and an explanation furnished, not only for the general tendency, as shown above, but also for the exceptions to it. We have to inquire what is meant by water of combination. Probably no term in chemistry has been more loosely used than this. Ordinarily speaking, it refers to the water which is contained in a substance in such a way that no amount of drying at 100 centigrade is able to dislodge it. In this way it is differentiated from unbound water, and probably from hygroscopic moisture. Such a definition, however, would include as a general thing water of crystallisation, which is not usually meant when we speak of water of combination. Nearly all metallic oxides and many salts have the power of entering into that peculiar hydrated, non-crystalline condition which Graham in 1861 denominated colloid or glue-like. As a result of extensive investigations Van Hamelen adopts the suggestion of Nageli of the micellian structure of colloids, that is to say, that these curious substances consist of heterogeneous molecular complexes which possess

a submicroscopical, web-like, porous formation, one of the distinguishing characteristics of which is the peculiar relation to and dependency upon water which they exhibit. The water content of these hydrogels (inorganic colloids) varies continually with the temperature and the vapour-pressure of the atmosphere in which they find themselves. Dried at high temperatures up to a certain critical point, they will lose nearly all their water, only to take it back again eagerly when allowed to cool in free air or in moist atmospheres. This dehydration and rehydration can be repeated indefinitely unless the temperature of drying is carried too high, when the faculty is gradually lost and finally destroyed. We have here to do with a certain kind of water of combination which we shall designate micellian water. It is just as much a characteristic of the plastic or colloid condition as water of crystallisation is a characteristic of many crystals, although we can have the water in these colloids replaced by organic liquids. Micellian water is absorbed into the structure of the particles of a powder of an inorganic hydrogel without changing the physical appearance, even under the microscope. Hygroscopic water is usually absorbed on the particles, producing a distinct appearance of wetness. Heating does not usually destroy the hygroscopic qualities of a substance; it invariably destroys the absorptive power of the micellian structure, if pushed far enough. It is not the purpose of this paper to review the work that has been done on colloids. The immediate object is to call attention to certain significant qualities which are shared in common by such inorganic hydrogels as silicic acid and ferric hydroxide on the one hand, and plastic clays and rock powders on the other. Both contain combined water: both lose water on heating, and take it up again on cooling in moist atmospheres. Both gradually lose this power on continued heating at high temperatures, and finally lose it entirely, together with plasticity, if the heating is pushed far enough. Very highly plastic clays and rock powders, after working up with water, usually shrink and deform on drying out: this quality is also universally noted in the case of the hydrogels. Silicic acid which has been air-dried can have water pressed out of it by subjecting it to very high pressures; the same phenomenon is known in the case of clays in the manufacture of hydraulic pressed bricks. It has been frequently claimed that the cause of plasticity is to be sought in the aluminium silicate (kaolin) which forms the essential ingredients in all clays. If plasticity is a question of a colloid condition of the particles, it seemed that plastic clays and rock powders ought to show the same peculiar relation to water as is shown by the hydrogels, and in a diminishing degree as the plasticity diminishes. In order to study the subject, a special form of furnace was devised that could be heated by a blast-lamp to any desired temperature up to 11,000° Cent. The temperatures were measured by means of a Le Chatelier platinum-rhodium pyrometer. No difficulty was experienced in maintaining the temperatures constant to within a few degrees. The mode of procedure was as follows:—Exact two-gramme samples of the various substances were heated in the furnace for exactly one hour, cooled in a desiccator over concentrated sulphuric acid for one hour, weighed as quickly as possible, and finally exposed under a large bell-jar over dilute sulphuric acid (24 per cent.), which had a vapour-pressure of about 18 millimetres at 24° Cent. At this vapour-pressure water does not absorb on the surface of glass or the particles of powders so that all gains in weight are a true measure of affinity for water. As nearly as possible, this bell-jar was kept at a constant temperature during the experiments, but when any considerable variation occurred, corrections were made to the results. The silicic acid hydrogel was prepared by neutralising sodium silicate with dilute hydrochloric acid, and washing the jelly by dialysis until the salt was entirely removed. The pure jelly was dried to a certain point on the steam-bath, and finally allowed to air-dry. The resulting white powder, which had every physical appearance of being dry, was found to contain about 20 per cent. of water. The hydrogels of iron, alumina, and magnesia were precipitated by dilute solutions of sodium hydroxide, thoroughly washed by decantation and finally air-dried. Finally, three samples of clay were selected for comparison. Clay No. 1 was highly plastic, clay No. 2 less so, and clay No. 3 contained an unusual amount of calcium carbonate. The results indi-

cate that identically the same peculiar power of absorbing water, which is gradually destroyed by heating, is possessed by clays and colloids. The difference is merely in degree. No amount of heating will destroy the power of lime, magnesia, and alumina to take up water again. Whatever theory we may hold as to the relation of water to these substances in the process of "slaking" it is quite certain that it is an altogether different phenomenon from the process which goes on when water is absorbed into the peculiar structure of a colloid. A question that naturally arises is, How are we to account for the well-known high binding powers of many homogeneous crystalline rocks, such as limestones and dolomites? As a matter of fact, pure calcium carbonate has no cementing value whatsoever; this quality is provided by certain hydrated impurities such as silica, ferric oxide, or even clay. The amount of these impurities need not necessarily be very large, but the distribution throughout the mass is probably of a very intimate nature. It has long been known to practical road builders that the binding power of many rocks increases as time goes on, under the combined influence of the action of traffic and water. Every potter knows that the plasticity of clay increases under the action of kneading and working with water. In some industries clay mixtures are stored away for considerable periods under wet blankets. This process is called "sweating," and is believed to be very beneficial. It has lately been suggested that bacterial fermentations are responsible for the improvement in the quality of clays under such treatment. The writer has no data on this subject, but it is well known that many of the nitrifying bacteria flourish in media composed of inorganic colloids, which suggests that the presence of bacteria may be a concomitant rather than the cause of improvement. Experiments in the laboratory have shown that the cementing value of briquettes is increased if the dough made from a rock dust is allowed to stand for some time before being moulded, and it is still more increased if the dough is kneaded. In summarising the results as presented in this paper it may be said that it has been pointed out: (1) That the cementing power of rock powders is a property similar to the plasticity of clays. (2) That all rock powders that have cementing power show the same peculiar relation to water that is shown by substances that possess an amorphous colloid structure—i.e., they can be dehydrated and rehydrated, until, by prolonged high heating, the structure is destroyed. It is not the intention of the writer to maintain that the gelatinous mass in which silicic acid separates from a dilute solution is in any way comparable to a plastic mass. The question is purely one of the conditions of the particles which go to make up the mass of plastic rock powder or clay. In the opinion of the writer, particles which are entirely crystalline in their nature have nothing to do with plasticity except to act as a diluent. It is the amorphous particles which, by reason of their characteristic structure, are able to absorb water and assume the condition which causes them to exhibit that coherence which in the mass we denominate plasticity.

BUILDING SUPERINTENDENCE.*

A GOOD title for a practical work on building, written by Mr. T. M. Clark, a Fellow of the American Institute of Architects. There are few treatises bearing on superintendence, although expositions on construction are numerous, the fact being that the superintendence of buildings is an art that is only learned by experience, and is largely a personal matter. The present "Manual for Young Architects, Students, and Others" has gone through several editions, and has now been rewritten and revised to meet the many requirements of modern construction. The Manual applies chiefly to American practice and construction, and is therefore in some things rather strange. The chapters contain the chief methods of construction used in the States. We have, first, the construction of a stone church; next a "wooden dwelling-house," then the "construction of a steel-frame building." The latter is an important introduction, as the steel-framed structure differs from everything else, and requires,

* Building Superintendence: a Manual for Young Architects, Students, and Others. By T. M. CLARK, F.A.S. I.A. New edition, revised, copiously illustrated. New York: The Macmillan Co.; London: Macmillan and Co., Ltd.

as the author says, special study. The remarks on stone buildings include some useful information on masonry, exterior stone facing, such as "neat random ashlar, quarry face and pitched joints," a kind of walling generally understood in this country. We quote the description: "This means that all the exposed surfaces are to be freshly split without weather-worn faces, such as would be admissible if 'rock face' were specified, and that the joints, instead of irregularly projecting, as is permissible in some engineering work, are to be 'pitched off' to a line previously drawn round the stone, all parts of which lie in a true plane at right angles with the surfaces formed by the joints. This is done by 'pitching-tool' or wide chisel with a very thick edge, and the result is to furnish blocks, which, however rough and projecting in the centre, all possess four well-defined edges, by means of which they can be placed upon and under each other with as much accuracy as the smoothest-faced stones." The stonework of broach spires are specified to have chiselled draft lines 2in. wide. These terms are explained, and the tools used, such as the "crandle," a toothed hatchet, composed of 8 or 10 pointed chisels wedged tightly into a frame with a handle. With this tool the surface of stone is obliquely struck until the inequalities have been reduced, and the surface covered with short parallel furrows. These are then crossed by other furrows, and by this means a smooth surface is formed, covered with a network of lines. The joints are then formed by a chisel draftsunk all round the face. Other operations, "droving," "pene-hammering," "bush-hammering," &c., are described and illustrated by good sketches. The remarks on "setting out the building" contain some useful information on the laying-out of the exterior lines of building, the setting-off of the angles by two tapes, or by using "three, four, or five rule" on a string, and other rule of thumb methods. These methods are all illustrated by diagrams. Then the method of striking the curve of apse of church is shown. The architect should always be present to see the staking out of a building, and verify the measurements and accuracy of the angles by measuring the diagonals. The author recapitulates the things to be remembered in the first laying-out and staking. The second visit includes the excavation, and the third and fourth visits are made the opportunity of describing the artful devices of foreman and builders in the foundations and masonry. In this way every part of the masonry construction is discussed, and other trades receive attention in their turn. The points that deserve attention in supervision are particularly noticed, and practical rules for calculating the weights on the foundation, floor loads, column loads, &c., are given as they occur. "Modern Dwelling Houses" forms the next subject, and all the difficult points of construction in timber framing and bedding in masonry, braced framing, "balloon" framing, brickwork bond of chimneys, flues, roofing, shingles, plumber's work, electric wiring, and other details are treated. One feature of this book is that the smallest details, like window fittings, door furniture, water closets and fittings, testing drains, &c., are dealt with. The chapter on the construction of a steel frame building is shorter, but concise, and many useful remarks are made. The Form of Specification is useful, and a chapter on contracts is given. The work may be regarded as a manual of practical construction, but referring to many points which the theoretical treatises entirely overlook. It is a practical guide that the young architect will find of service in his daily work and rounds.

ESTIMATING AND PRICING QUANTITIES.*

NO book, however capable and up to date, can constitute a really adequate substitute for a competent estimating clerk, whose figures in the majority of cases alone can be relied on in tendering with success in competition. It is one thing to secure a job, and quite another matter to be landed with a contract at a figure below a commensurate equality with the cost of the work undertaken, as any tyro in building matters can perfectly well realise. The mere statement of so elementary a factor in profitable trading looks so self-evident that it seems foolish to state it on paper; but, for all that, many a builder, to his

financial loss, has found out its reality and ease of falling into such a position unwittingly. The cost of labour is the greatest factor in mistakes of this kind, and the enterprising country contractor anxious to get a footing into the Metropolis or some other centre of industry finds out, often enough to his cost, how necessary it is to study local difficulties and conditions. No book can exactly supply such information, and Mr. George Stephenson in the preface to the fifth edition of his handbook on "Estimating," which Mr. Batsford has just published, does well to repeat what was said in the first edition as to the need of visiting the site and noting its surroundings in reference to getting materials upon it, the available space to work in, and the nature of the soil. Labour, after all, is the leading speculative item nowadays. The system adopted by the author of this handy aid, when you know how to make practical and proportionate use of it, is to add the builder's profit to each item instead of lumping a percentage on the total. Throughout all the trades Mr. Stephenson carefully indicates how to adapt prime costs into profitable undertakings at competition prices, though, after all, in most trades only experience can give the tenderer the knowledge which will enable him to qualify his figures so as to retain a remunerative margin without making his prices prohibitive. In all tendering there must be many speculative items, such as cutting away for and making good in all trades for all trades, especially where jobbing work comes in at all. Something, too, and at times a great deal, depends upon the special requirements and disposition of the architect supervising the contract. To know your man is of the greatest possible importance, even though only good work is asked for and specified, and also intended to be given by the builder. No book can pretend to furnish such knowledge as that; but in so far as a writer can assist an estimator, Mr. Stephenson has carefully and reliably supplied the information available, and he gives it in a compact and handy form under the usual trades common to ordinary builders' contracts.

On Monday the Archdeacon of Salop dedicated a new organ, which has been placed in Condover parish church by public subscription at a cost of £580, and also a stained-glass window erected in memory of two parishioners. The organ was built by Messrs. Nicholson and Lord, of Walsall, and has two pitch-pine fronts, with spotted pipes. The window is in the south aisle. It depicts the Wise Men bringing gifts to the Infant Christ. The artists were Messrs. Hardman, of Birmingham.

Mr. John Fairweather, A.R.I.B.A., 136, Wellington-street, Glasgow, has been appointed architect to the Glasgow East End Industrial Exhibition, which opens next December. Four competitive designs were submitted to the exhibition council, and from these the council selected those of Mr. Fairweather, as being the most practical and suitable for the exhibition. Much originality and resource was shown in the adaptation of the present buildings and grounds, and in the treatment of the entrance facade and concert-hall. The latter is designed to accommodate 3,500 persons, and the platform, in addition to the usual accessories, will have a fine orchestral organ.

The statue of the late Sir Edward J. Harland, Bart., which stands in a commanding position in front of the new city-hall buildings at Belfast, was unveiled on the 23rd ult. by the Earl of Glasgow, in the presence of a large assembly of citizens.

The Rev. Henry Edward Fowler Garnsey, B.D., senior Fellow of Magdalen, and the last but one of the surviving Fellows upon the original foundation of the college, who died on Monday at Bath, aged 77 years, informed the college a short time since that he wished to hand over the sum of £5,000 to be expended in replacing Wyatt's plaster ceiling to the college hall by a timber roof, resembling, as far as might be, the original, which was removed rather more than a century ago. The college has obtained designs from Mr. G. F. Bodley, R.A., and during the past year the roof has been constructed and is ready for erection. By a singular coincidence the first actual step towards placing it in position was taken on the very day of the donor's death.

The Board of Trade have determined to confirm the Order of the Light Railway Commissioners for the construction of light railways, or rather electric tramways, at Maidstone, as to Railway No. 1, from High-street to the borough boundary, but not as to Railway No. 2, from the borough boundary to the Bull Inn, Barming.

A Bangkok telegram says that a contract for 30,000 tons of rails for Siamese railways has been given to Messrs. Dorman, Long, and Co., of Middlesbrough.

OBITUARY.

It is with deep regret that we record the death of Mr. HENRY J. BYRNE, the chief of the staff of Messrs. Eastwood and Co., Ltd., Lambeth, on the 24th ult. The deceased, although only thirty-five, had been connected with the firm for over twenty-three years, and for ten years had been the confidential clerk and private secretary to Mr. G. E. Wragge, the managing director. The funeral took place at Barnes on Monday, and the esteem and affection in which Mr. Byrne was held by every member of the firm, as well as by all those with whom business or leisure brought him in contact, was evidenced by the large attendance of all classes at the funeral and at the memorial service, which, by the kindness of the vicar, the Rev. E. Gordon, was held at St. John's Church, Waterloo-road.

THE death occurred last week, at his house, Thames View, St. Margaret's, near Twickenham, of Mr. FRANCIS TIMMER GOMPERTZ. He was the eldest son of Mr. Solomon Gompertz, and was born in 1831. He early turned his attention to the subject of Classical architecture, and received the silver medal of the Royal Academy in 1856, as well as the gold medal of the Royal Academy in 1857, for his work in his designs for new municipal buildings, and was again awarded, in 1859, further first-class honours for his proposals for a cathedral in the Mediaeval Gothic style, and for his proficiency in the same class of work. After his marriage he travelled much, in company with his wife, throughout the by-ways of England and in Southern Europe, and it is in a measure due to these extended travels that his valuable art collection was completed.

CHIPS.

The corporation of Southampton have accepted the tender of Messrs. H. Stevens and Co., of that town, at £11,136, for the erection of a new electric light station, from plans prepared by the borough engineer.

Mr. Frank H. Gorst, the sole partner in the firm of Messrs. Richard Gorst and Son, architects and surveyors, of 7, Birley-street, Blackpool, has been selected to be the architect for the new church to be built for the All Saints' parish, Blackpool.

The Bishop of Lichfield dedicated, on Monday, an enlargement of St. John's Church, West Bromwich, consisting of north and south transepts, a choir vestry, and organ-chamber, which have been erected at a cost of £1,400.

The Mayor of Leamington formally opened, on Friday, the new Horsfall refuse destructor, which has been provided at a cost of £7,651, and also the new Mill Gardens, suspension bridge, turbine, and weir.

The memorial to the late Sir Henry Bessemer, inaugurated at a Mansion House meeting on Monday, will have as its first object the establishment of completely-equipped metallurgical teaching and research works in London.

A new cottage hospital at Exmouth was opened by Lady Gertrude Rolle on Saturday. Wards containing six beds each, one for men, the other for women, lie upon each extremity of the frontage, and are connected by a wide corridor, upon which open two small wards for special cases, a committee room, and matron's room. At the rear are the operating room, ward kitchen, bathroom, and the out-patients' department. The kitchen and offices, together with bedrooms and sitting-rooms for the four nurses, are upon the first floor. Messrs. Teit and Harvey, of Exeter, were the architects, Mr. Albert Hayman, of Exmouth, was the builder, and Mr. Mansfield, also of Exmouth, clerk of works. The cost has been £4,000.

The Rutland Archaeological and Natural History Society had an excursion on Wednesday in last week to the churches of North Luffenham, Edith-weston, and Manton.

The South African War Memorial at Clevedon, Somerset, was unveiled on Saturday. The monument takes the form of a column of the Tuscan order, 18ft. high. It is of Scotch granite, highly polished, and the capital, with dove and wreath, is carved from Sicilian marble. The design is that of Mr. Hans Price, architect, of Weston-super-Mare, and the work has been carried out by Mr. J. N. Cox, sculptor, of Clevedon.

On Thursday afternoon in last week the cornerstone was laid of St. Gabriel's Mission Church, which is being erected to meet the requirements of the Ruddyard side of Horton parish. Mr. J. T. Brealey has prepared plans for a building to accommodate 100 worshippers. The tender of Messrs. Heath and Bowyer, of Ruddyard, amounting to £675, was accepted, and with the interval fittings the building will cost £850.

* Estimating: a Method of Pricing Builders' Quantities for Competitive Work. By GEORGE STEPHENSON. B. T. Batsford, 94, Holborn, W.C. 4s. 6d. net, cloth.

Building Intelligence.

ST. ALBANS.—Memorial-stones were laid last week of the new Roman Catholic Church, now in course of erection in Beaconsfield-road. The church is to be in the Romanesque style, the building, having a frontage to Beaconsfield-road, and backing on to the Midland Railway, consisting of a nave of eight bays and aisles. The main entrance will be by double doors at the north end, and from the north-east corner will rise a tower with open bell turret, surmounted by a large cross, the measurement to the top of which will be about 86ft. The entire building is to be carried out in red brick, with moulded cornices and labels. At the southern end of the church will be a semi-circular apse for the altar, separated from the body of the church by a central arch, with niches on either side to receive the statues of the Virgin and St. Joseph. The sanctuary will extend to the first bay, the altar being approached by seven steps. The roof is to be trussed and panelled, the building being lighted by seven clerestory windows and windows inserted at the north end. Hopper ventilators will be inserted in the windows. The heating will be by means of hot-air generated in an underground chamber at the south-eastern end of the building, the sacristy being erected above. It is estimated that the building, when completed, will cost about £6,000, and will be capable of seating about 780 persons. For the present, however, it is proposed to proceed only with the apse and four bays—practically half of the nave—at a cost of £1,500, affording seating for a congregation of about 250, together with the sacristy and heating chamber. The architects are Messrs. John Kelly and Son, of 166, Oxford-street, W., and the contractors Messrs. C. Miskin and Sons, of St. Albans.

ST. BARTHOLOMEW'S HOSPITAL.—The sub-committee on building of the Lord Mayor's Committee of inquiry into the affairs of St. Bartholomew's Hospital met on Friday at the Mansion House, the Lord Mayor presiding. Alternative plans for the proposed improvements at the hospital were submitted by the architect, Mr. E. R. Panson, F.R.I.B.A., and considered, together with reports upon them by the medical council. The inquiry is now practically completed, but another meeting of the full committee will be held at the Mansion House as early as possible, in order to agree upon a report. A new out-patients' department being imperatively necessary, it was decided by the committee that that work ought to first be proceeded with. The estimated cost of the work is about £100,000.

A second section of the electrified portion of the L.C.C.'s South London tramway system was opened without ceremony on Thursday afternoon in last week. This is the route running from Camberwell Green to St. Mark's Church, Kennington Common, via Camberwell New-road, about a mile in length, which has been converted from a single line worked by horse traction to a double line electrically equipped, while the thoroughfare has been paved throughout with wood blocks, and is being widened between Camberwell Green and Warner-road. At Kennington Common the tramcars run over the previously opened routes to the bridges of Westminster, Waterloo, and Blackfriars. A further section, from St. Mark's Church, Kennington, via Harleyford-road (which is being widened at its southern end), to Vauxhall Station, will soon be completed.

A fire, causing damage to the extent of £20,000, occurred on Saturday evening at the extensive wood-working depot of Messrs. Grimwood and Sons, building contractors, Sudbury, Suffolk. A man named George Shipman, who had tramped from London and sought work, is under remand on a charge of arson. About 100 workmen are thrown out of work, and some 15 had all their tools destroyed. On the adjoining premises stands the historic walnut tree under which Cromwell used to paint. It fortunately escaped injury.

The 6th annual report of the Deputy Keeper of the Public Records, just issued as a Parliamentary Paper, states that the chief event of the year was the opening to the public during certain hours of a museum, built upon the site of the Rolls Chapel, retaining its old monuments and stained glass, and containing an interesting collection of selected historical documents, illuminations, autographs, and other objects.

The parish church of Hartshorne, Derbyshire, has just been reopened after enlargement and restoration from plans by Mr. G. F. Boley, R.A.

Engineering Notes.

PROPOSED FORTH AND CLYDE SHIP CANAL.—Messrs. D. and C. Stevenson, civil engineers, Edinburgh, have been engaged for some weeks surveying the valley between the estuary of the Forth and Loch Lomond for clients; and this firm has now been instructed to prepare plans for a canal to connect the Firth of Forth with the Firth of Clyde. The plans will be prepared forthwith, and they will be lodged in November for the purpose of securing Parliamentary powers for the scheme. The route the engineers state the proposed canal will take is from Alloa, on the eastern side, where it will pass to the north of the links of the Forth and to the northward of the town of Stirling. Passing along the valley of the Forth near Kippen, a deep cutting will take the canal into Loch Lomond, near Buchanan Castle. The navigation will then be on Loch Lomond to Tarbet, and another deep cutting will take the canal to Loch Long, which will be the outlet on the west. Loch Long is an arm of the sea providing a safe anchorage, and navigable by all classes of vessels. The actual distances of the canal are as follows:—From Alloa to Loch Lomond, 28 miles; Loch Lomond to Tarbet, 14 miles; and Tarbet to Arrochar, 1½ mile. Arrochar is at the head of Loch Long, and lies 15 miles from the Clyde. The actual cutting extends to 29½ miles, and the chief engineering difficulties will be encountered near Loch Lomond, where a very deep cutting will be required, and again at the narrow neck between Loch Lomond and Loch Long. The surface of Loch Lomond is 22ft. above the mean sea-level, but the hard on the strip between Loch Lomond and Loch Long rises to a maximum height of 130ft. above mean sea-level. The canal, if carried out, would shorten the passage by 529 miles between the Clyde and East Coast ports.

NORTH BRITISH RAILWAY COMPANY'S NEW LEITH-EDINBURGH LINE.—The new North British Railway line between Leith and Edinburgh, which has been in course of construction for the last four and a half years, was opened for traffic on Wednesday. The line is about a mile long, and starting from the Central Station, which practically extends from the foot of Leith-walk to Easter-road, it runs at a height of about 15ft. above the street level, behind Duke-street, cuts through Glover-street, and is carried over Easter-road by a bridge. From this point the railway runs through the Eastern Sawmills, almost parallel with Lochend-road, and near where this road is crossed by the Caledonian Railway Company's new line the railway dips into a cutting 35ft. deep, which enables it to pass under the Caledonian Company's line. It is then carried through the farm between Lochene Loch and the Eastern Cemetery, and joins the suburban line a little below Abbeyhill Station. The Central Station has a frontage of 220ft. in Duke-street, where it is four stories high, and 200ft. in Leith-walk, where it is only two stories high. On the street levels shops have been erected, and above them are the station, waiting-rooms, and offices on the platform level. The other two stories in Duke-street consist of dwelling-houses for the railway officials. The main entrance and the booking-hall are at the corner of Duke-street and Leith-walk, and at this corner the building is surmounted by a three-dialled clock. The station is 830ft. long and 220ft. broad at its widest point, and the entire building is roofed with glass, supported by one-span iron girders. There are four platforms, and hydraulic hoists have been erected at Duke-street and Easter-road respectively for the conveyance of heavy luggage into the station, which is lighted throughout by electricity. The contractors for the building were Messrs. G. and R. Consins; and for roofing, Sir William Arrol and Company, Glasgow. Messrs. Blyth and Westland, C.E., were the engineers.

WICK AND LEBSTER LIGHT RAILWAY.—This railway, which was opened for traffic on Wednesday, having been inspected by Major Druitt, of the Board of Trade, is 13½ miles in length. The estimated cost was slightly over £70,000. The Highland Railway Co. undertook the construction of the line. The engineer is Mr. Roberts, C.E., Inverness, and the contractor Mr. William Kennedy, Partick. The track starts from the west end of the Highland Railway Station at Wick, a short distance from which it curves to the left, and proceeds in a southerly direction for

the rest of the way, running parallel with the country road. Intermediate stations are provided at Thrumster, Ulbster, Clyth, and Occumster.

CHIPS.

It having been announced that new building by-laws are likely to be adopted soon by the Rochdale Corporation, some of the local builders are hastening to get plans sanctioned under the existing regulations. To a great extent this explains the fact that at their meeting on Thursday in last week the building committee had the plans for no fewer than 225 proposed new houses submitted to them for approval.

A Local Government inquiry was held at Castle Eden Colliery on Friday by Mr. A. A. G. Malet, inspector, into an application of the Easington Rural District Council for sanction to a further extension of the sewerage scheme for Monk Hesleden. Messrs. D. Balfour and Son produced information as to the scheme. There was no opposition.

The foundation-stone of St. Augustine's Church at Dovercourt will be laid by the Earl of Warwick with Masonic ceremonial on Saturday in next week, the 11th inst.

The new Rhætian Railway, whereby the journey from London to the Engadine will be accomplished in 30 hours instead of three days as hitherto, was officially inaugurated on Sunday, in the presence of the Federal authorities. The line was opened for general traffic on Wednesday. The construction of the railway was begun in October, 1898, and four years have been occupied by the boring of the Albula Tunnel, which is 5,866 metres in length. The railway starts from Thusis and runs to Celerina at present, but will open to St. Moritz next year.

A new organ screen has just been presented to Llandaff Cathedral by Mr. F. Insole, and was formally unveiled in last week. The screen was designed by Mr. J. H. Seddon, of the firm of Messrs. Seddon and Carter, architects, Cardiff. The work, which is in teakwood, has been carried out by Messrs. Clarke, of Llandaff.

The Lancashire and Cheshire Antiquarian Society visited Arbor Low on Saturday. The party included Professor Boyd Dawkins, Mr. W. J. Andrew (who has conducted excavations), Mr. W. E. A. Axon (the president), and Mr. G. C. Yates (the hon. secretary). Professor Dawkins pointed out the striking resemblance between Arbor Low and Abury.

A stained-glass window has been placed in All Saints' Church, Maidstone, in memory of the soldiers of West Kent who fell in the war. It was executed by the firm of Lavers and Westlake, Art Glass Works, Eadell-street, Bloomsbury.

A Committee of the House of Lords has passed the preamble of the City and South London Railway Company's Bill for the extension of their line from the Angel to Euston, and the construction of a new "tube" from Brixton to King William-street, E.C. The Bill has already passed through all stages in the House of Lords.

A Local Government Board inquiry was held at Norwich last week before Lieut.-Col. A. C. Smith, R.E., as to an application from the city council for approval to the borrowing of the sum of £1,550 for the purchase of the premises Nos. 3 and 5, Migdalen-road, and the conversion of the same into a divisional police-station.

At an early meeting of the London County Council the Improvements Committee will submit for approval a proposal for the execution of certain street widenings in South London in connection with a scheme for the construction of a new tramway from Camberwell Green to Lordship-lane. The thoroughfares proposed to be widened in certain parts are Denmark Hill, Champion Park, Grove-lane, Dog Kennel-hill, Grove-vale, and Lordship-lane. The gross cost of the improvement is estimated at £119,900, of which £78,900 represents the cost of acquiring property and £41,000 the cost of the necessary paving and other works.

In the case of the application made for a discharge from bankruptcy on behalf of John Thomas Roach Pengelly, otherwise H. R. Nathan (trading as H. R. Nathan), Chingford, late Rotorna, Upper Walthamstow-road, Walthamstow, N.E., builder, an order of discharge has been refused.

The new superintendent of buildings in New York recently did a courteous thing in offering to a number of the principal architects in the city the nomination of a chief inspector, promising to appoint anyone that they might nominate, whether he knew him or not. The choice fell upon Mr. Walter T. Smith, of New York, who was for several years superintendent for Messrs. Carrère and Hastings, and acted as general superintendent of construction of the buildings for the Pan-American Exposition at Buffalo. According to his promise, Mr. Thompson immediately appointed Mr. Smith.

PROFESSIONAL AND TRADE SOCIETIES.

BRISTOL CIVIL ENGINEERS AT NEWPORT.—The Bristol Association of Engineers visited Newport, Mon., on Friday, for the purpose of inspecting the public works which the corporation have in hand. They were met at Magor Station by Alderman T. Canning (a member of the Newport Waterworks Committee) and R. H. Haynes (borough engineer), and were driven to Wentwood, the site of the great waterworks which will supply the Newport of the future. Alderman Canning gave a general account of the works, the main feature of which is a reservoir to contain nearly 400,000,000 gallons; and Mr. Baldwin Latham (consulting engineer) and Mr. J. Macdonald (works manager) explained the works in detail. The party were entertained at luncheon by Mr. Latham, and after lunch they drove to Newport in brakes, inspected the new electric power station, went on to Messrs. Lysaght's Orb Works, visited the site of the new transporter bridge (the first on that principle to be erected in the United Kingdom), and returned to the King's Head for dinner, prior to returning to Bristol. Among the party were the president (Mr. A. P. I. Cotterell), Mr. Pearson (chief waterworks engineer), and Mr. Irvine (Bristol gas engineer).

CONFERENCE OF SANITARY INSPECTORS.—The seventh annual conference of the National Union of Sanitary Inspectors, founded in 1887, and having at present a membership of 413, was held on Thursday, Friday, and Saturday at the town-hall, Stratford-on-Avon. Prior to the conference, the annual meeting of the union was held, and was followed by the annual meeting of the Midland District Centre. In their annual report, the executive council of the union recorded another successful year, and congratulated the members upon the standard of the work of the session, and on the satisfactory condition of the union in general. There had been an increase in membership of 15. One hundred and ninety-two sanitary districts were now represented. The roll of members included representatives from thirty counties in England and Wales, and the influence of the union had made itself apparent in several of the southern counties. The financial condition of the union was very satisfactory. The council had to again express regret that the introduction of the long-deferred Bill for the codification and amendment of the Public Health Acts had again been postponed, and the dropping of the Bill introduced by Sir Francis S. Powell, M.P., president of the union, which had for its object the amendment of the law relating to the qualification and tenure of office of medical officers and inspectors, and provisions as to superannuation allowances, was to be deplored. The council had resolved to petition the Local Government Board repudiating the opposition to the Bill of the Municipal Corporations Association, on the ground that it was founded on a misrepresentation of fact. The president of the union for the ensuing year will again be Sir Francis Powell, and Mr. H. H. Spears, West Bromwich, will act as chairman of the council. When the members assembled for the conference they were cordially welcomed to the town by the Mayor (Councillor G. M. Bird) and Alderman Park (chairman of the sanitary committee). Among the papers read was one by Professor Boyce, on "The Necessity for the Provision of Systematic Sanitary Training, in View of the Rapid Progress of Sanitary Science." Mr. J. Brook, Stratford-on-Avon, gave information concerning the condition of affairs in his own district, and its sanitary progress during recent years.

NATIONAL FEDERATION OF BUILDING TRADE EMPLOYERS BACK UP LORD PENRHYN.—At a special meeting of the Council of the National Federation of Building Trade Employers of Great Britain and Ireland, held at the Midland Hotel, Derby, the following resolution was moved by Mr. William Sheppard, L.C.C., London:—"That the members present at this meeting of the Council of the National Federation of Building Trade Employers of Great Britain and Ireland desire to convey to Lord Penrhyn their appreciation of his successful defence, and persistent maintenance of the principles of freedom of contract, liberty of the individual, and security of property. The members also desire to thank Lord Penrhyn for his attitude in respect to these principles, and express their sincere regret at the attempts which have been made to misrepresent Lord Penrhyn's conduct." The motion was seconded by Mr. W. M. Blackburn (Cardiff), and

was carried unanimously, the formal resolution being signed on behalf of the Federation of Building Trade Employers of Great Britain and Ireland by Mr. C. W. Green (president) and Mr. C. Alfred G. Hassall (secretary).

CHIPS.

During the past week Mr. Carnegie has promised the following amounts for free libraries, on the usual conditions:—Leyton £8,000 (for two buildings), Torquay £7,000, Ramsgate £7,000, Twickenham £6,000, Stoke Newington £4,000, Crompton £2,500, St. Anne's-on-Sea £3,500, and Lurgan £2,000.

Messrs. E. H. Shorland and Brother, of Manchester, have recently supplied their patent Manchester grates and exhaust roof ventilators to the Culcheth Cottage Homes, near Warrington.

At the council-chamber, Birmingham, on Friday, Mr. H. B. Boulnois, Local Government Board inspector, held an inquiry into the merits of a scheme prepared by the London and North-Western Railway Company for providing new dwellings for persons of the labouring class. The London and North-Western Company propose to acquire thirty-three houses near Monument-lane Station for the purpose of improving the railway. The houses were occupied by persons of the labouring class, and accommodation will be provided for the persons displaced, numbering 122, by houses at no great distance from those pulled down. It was intended to erect nineteen new houses, each house containing five rooms, with yard, &c. Further information was given to Mr. Boulnois by Mr. Stannard, district estate office of the company. Messrs. Ball and Hatley, of the chief estate office, were also present.

The new Church and Sunday-schools erected by the United Methodist Free Church body at Catchgate, near Annfield Plain, were opened on Friday. The church, which is built of stone, will accommodate some 500 worshippers, and provision is made in the Sunday-school for about 300 children. The designs were prepared by Mr. Alfred Davis, of Burnopfield, while the contractors were Messrs. Ayton and Sons, of Benfieldside. The total cost is over £2,100.

Foundation-stones were laid on Monday of a new Wesleyan Church at Milburn, near Ponteland. The church has been designed to seat over 200 persons; a large vestry is arranged so that on special occasions this may be used for extra seating accommodation by means of a sliding partition. The plans show a building in a simple treatment of Gothic. The contractor is Mr. Wm. Boiston, of Higham Dykes, the architects being Messrs. Marshall and Tweedy, Newcastle.

At their last meeting the corporation of Ipswich decided to purchase two additional parks for the borough. One of these is the higher portion of the grounds attached to the late Jeremiah Byles's mansion in St. Helen's parish; it is well-wooded, and contains 11½ acres, and will cost £7,000. At the same time, a fringe for widening St. Helen's-street and Nottidge's-lane will be taken off the lower portion of the estate, the remainder of which will be built over. The second fresh open space is the Lower Arboretum, a well-wooded park-like enclosure lying between the Upper Arboretum and Christchurch Park, both of which are already in the possession of the corporation; it is 5½ acres in area, and has cost £900 and a rent charge for 25 years of £80 a year.

A new Board school at Badwas, Mon., was opened last week. It accommodates 450 children in two departments, and has cost £2,750. The architect is Mr. J. H. Phillips, of Cardiff and Caerphilly, and the contractor Mr. Marcus Harding, of Caerphilly.

The Local Government Board have sanctioned the borrowing of £1,052 for the construction of a refuse destructor by the corporation of Eccles.

The Bishop of London consecrated on Tuesday the new church of St. Cyprian, situate in Dorset-square, Marylebone. Designed by Mr. J. N. Comper, it is an example of 15th-century English Gothic. The internal walls are faced with Bath stone, and the roof is of pine with fibrous plaster panels. As it stands, the church has cost £13,000, and a congregation of more than 600 is accommodated.

Mr. William Foulis, C.E., gas-engineer to the Corporation of Glasgow, died on Sunday last at 2, Montgomerie-gardens, Glasgow, after a short illness. Mr. Foulis, who was seventy years of age, was the son of a former gas manager, of St. Andrews. In 1869 he was appointed gas manager to the Glasgow Corporation, and had effected many improvements in the works, including the construction of an apparatus, patented by him in conjunction with Sir William Arrol, for charging and drawing retorts, a contrivance widely adopted elsewhere, and which was said to save a shilling per ton on the cost of labour. Mr. Foulis leaves a widow and one son, who is an engineer.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the BUILDING NEWS, Clement's House, Clement's Inn Passage, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to THE STRAND NEWSPAPER COMPANY, LIMITED.

Telegraphic Address:—"Timeserver, London."
Telephone No. 1633 Holborn.

NOTICE.

Bound copies of Vol. LXXXIII. are now ready, and should be ordered early (price 12s. each, by post 12s. 10d.), as only a limited number are done up. A few bound volumes of Vols. XXXIX., XL., XLVI., XLVII., XLVIII., XLIX., L., LXXI., LXXII., LXXIII., LXXIV., LXXV., LXXVI., LXXVII., LXXIX., LXXX., LXXXI., and LXXXII. may still be obtained at the same price; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

Handsome Cloth Cases for Binding the BUILDING NEWS, price 2s., post free 2s. 4d., can be obtained from any Newsagent, or from the Publisher, Clement's House, Clement's Inn Passage, Strand, London, W.C.

TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 6d. (or 6dols. 30c. gold). To France or Belgium, £1 6s. 6d. (or 33fr. 30c.). To India, £1 6s. 6d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 6d.

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of eight words, the first line counting as two, the minimum charge being 3s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Situations and Partnerships.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" and "Partnerships" is ONE SHILLING FOR TWENTY-FOUR WORDS, and Sixpence for every eight words after. All Situation Advertisements must be prepaid.

* * Replies to advertisements can be received at the office, Clement's House, Clement's Inn-passage, Strand, W.C., free of charge. If to be forwarded under cover to advertiser an extra charge of Sixpence is made. (See Notice at head of "Situations.")

Rates for Trade Advertisements on front page, and special and other positions, can be obtained on application to the Publisher.

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page Advertisements and alterations in serial advertisements must reach the office by Tuesday morning to secure insertion.

RECEIVED.—C. W.—E. S.—M. B.—M. and Son.—L. R.—O. E. A.—R. K. K.—N. and Co.—D. D.

STANDARDISING BRICKS.

To the Editor of the BUILDING NEWS.

SIR,—In your last issue (p. 886) you give a report of the conference held at the Building Trades Exhibition to discuss the desirability, or otherwise, of formulating a standard of sizes for bricks. There seems to be a feeling on the part of some of the speakers that in the North of England very little interest would be taken in the movement.

As I am one who has been desirous for many years of seeing something like uniformity in this matter, I feel compelled to write and state that I am of the opinion that a large number of architects in the North would support the resolution carried at the meeting. I have myself for the last three years specified a uniform size of brick for facing common and glazed work to wall four

courses to a foot with joints. Thus I am enabled to obtain a thin wall with facings on one side, glazed the other, and filled internally with common bricks with a perfect bond, and saving any cutting or using of iron ties.

I have never found the builders raise any objection when my requirements have been clearly stated in the specification before tendering, nor have I had any difficulty with the brick-makers.

The standardising of the sizes of bricks rests with us architects far more than with the makers.—I am, &c., H. ASCROFT CHAPMAN.

Prudential Buildings, Park-row, Leeds,
June 30.

Intercommunication.

QUESTIONS.

[11981].—**Plaster of Paris.**—Can any of your readers recommend a book dealing with manufacturing and use of plaster and its combination?—G. W. KAPLER.

[11985].—**External Plaster.**—Are the white cements—Keeble's, Parian, Alcant, &c.—durable for external plastering between half-timber work? If so, is it the custom to use sand or port cement, or on a ground of Portland? Is there any other approved method of finishing external plastering a light colour without sacrifice of durability?—W. A.

[11986].—**Flats.**—In what year were flats first built in London, and where are some of the earliest buildings?—J. K.

[11987].—**Charges.**—What would be a fair and reasonable professional charge for making (1) general particulars and tracing of staircases for four proposed electrical passenger lifts and four dinner lifts? (2) Obtaining estimates (giving particulars personally to engineers, tendering)—highest tender £1,644, lowest tender £1,070?—B.

[11988].—**Australia.**—I am thinking of emigrating to Australia at the latter end of this year, chiefly from a health standpoint. I should not wish to be away more than twelve months, and, of course, should like to carry on my present employment, an architect and surveyor's assistant. I should be glad of any advice respecting conditions and advisability, also likelihood of obtaining a situation.—J. G. E.

[11989].—**Drift under Slatting.**—Is there any composition for covering slating to take the place of tar and sand (or tar and sand) less unsightly and equally effective?—J. E. C.

[11990].—**Plans and Specifications.**—When a building has been completed in accordance with plans and specifications prepared by an architect, and the usual commission paid for the use of them and superintendence, are they the property of the architect or the building proprietor?—A. M. R.

REPLIES.

[11982].—**Measurement of Plate-Glass, &c.**—Plate-glass and lead-lights should be measured from rebate to rebate, or extreme dimensions, and any part of an inch is reckoned as an inch in measuring. In billing plate-glass item state thickness and quality, and superficial quantity in a square, commencing with not exceeding 2ft. sq., and keeping each size separate, thus: 3, 4, 5, 6, 7, 8, 10, 12, 14, 16, 18, 20, 25, 30ft., and so on, &c. Also state if square, circular, or irregular shape, and keep separate, and describe how glazed. In lead-lights describe the lead: if in quaries, if bordered, the description of glass if lights are secured with copper wire or bands. Keep the parts in pointed or cusped heads or tracery work separate, stating that the same has been measured to the extreme points, and that it has been measured square.—R. E. GARDNER and SONS, Quantity Surveyors, 112, St. Peter's-road, Leicester.

[11982].—**Measurement of Plate Glass, &c.**—Unless it is stated in the bill of quantities, if any, that all measurements are "strictly net," all glass or lead-lights should be measured per foot superficial. The extreme dimensions being measured, whether of square, circular, or irregular shape, any part of an inch is called lin. in measuring. It is usual to state in the quantities that all glass is measured square, such as cusped or pointed heads, tracery, &c.—CHAS. MACKENZIE, Bury.

The London County Council Technical Education Board propose to take over the Camden School of Art, Dalmeny-avenue, Holloway, which is described as "one of the largest and most successful of the schools of art carried on in London under the auspices of the Board of Education."

At the East Ham town-hall, on Tuesday, a marble bust of the late Elizabeth Fry, the well-known philanthropist and advocate of prison reform, given to the district by Mr. J. Passmore Edwards, was unveiled by Mr. Sydney Buxton, M.P. Mrs. Fry lived for years in East Ham, where there are two memorials of her life-work—the church of St. Stephen, in Green-street, Upton Park, erected in 1837, and the Primitive Methodist Church, also at Upton Park, erected in 1833. The bust is of white marble on a tall pedestal, and it depicts the lady in the Quaker bonnet of her period. Mrs. Fry lived for 29 years in the White House, in Placket-grove, which building is now practically the only relic of the 18th century still existing in East Ham.

PARLIAMENTARY NOTES.

ORDNANCE SURVEY MAPS.—In reply to Mr. Kennedy, Mr. Long says:—The boundaries of parishes and baronies were omitted from the new issue of the 1in. Ordnance Survey Map in order to avoid confusion with other and more important details; but, on the other hand, a special edition of the map is now issued for local government purposes, on which the boundaries of rural and urban districts, and also those of counties, district electoral divisions, and county boroughs are shown in red. Any question which may arise as to the old boundaries of parishes and baronies could always be settled on reference to the copies of maps of the old edition, which are retained by the Ordnance Survey.

DATES FOR COMPLETION OF PUBLIC BUILDINGS.—Mr. J. Ellis asked in the House of Commons on Friday what were the dates fixed by contract for the completion of the various public buildings in Whitehall, Parliament-street, and South Kensington, and was such progress being made with the respective contracts as to insure their readiness for the public service by the specified dates. Mr. Victor Cavendish replied:—In answer to the first part of the question, the dates for the completion of the contracts for the fabrics of the respective buildings are as follows:—New War Office, June 26, 1905, new Public Offices in Parliament-street, June 1, 1907, Royal College of Science, June 1, 1905, Victoria and Albert Museum, February 23, 1907, Admiralty (Block III.) (say) June 30, 1906. (Contract about to be made for superstructure.) With regard to the second query, I have to say that such progress is being made with the above works as to justify an assumption that they will be completed by the specified dates. In some cases it is possible that the fittings will not all be finished; but every effort will be made to avoid delay.

CHIPS.

On the occasion of the retirement of Mr. T. E. Tiffin, A.M.I.C.E., P.A.S.I., from the position of deputy borough engineer of West Hartlepool, to take up the appointment of engineer and surveyor to the Urban District Council of Dartford, he was the recipient of a service of silver plate presented as a token of the regard in which he is held by his colleagues.

The annual Government Report on Indian Railways, published this week, states that in the three years 1900-2 2,379 miles of open line have been added to the railway systems. Subsequent additions up to May 1 last have brought up the total mileage of Indian railways to 26,561, of which 14,316 miles are on the standard 5ft. gauge and 11,247 on the metre gauge.

Mr. W. A. Dacot, an inspector of the Local Government Board, has held an inquiry at Sheffield into an application of the city council for sanction to borrow £8,938 for Eyre-street extension.

The provisional order obtained by the urban district council of Rumbottom, Lancs. from the Board of Trade for the construction of tramways 5½ miles long has passed the committee of the House of Lords. The estimated cost is £60,000.

Mr. J. B. Peace, M.A., Emmanuel College, Cambridge, has been appointed University Lecturer in Mechanical Engineering for five years from Midsummer, 1903.

The London County Council resolved on Tuesday "That, having regard to the urgent need of healthy dwelling accommodation for working people, it be referred to the Housing of the Working Classes Committee to consider the desirability of putting into operation section 59 (part III.) of the Housing of the Working Classes Act, 1890, which gives power to acquire 'existing buildings,' and to 'alter,' 'enlarge,' 'improve,' and 'convert' the same into dwellings."

The members of the Scottish Ecclesiological Society visited Linlithgow on Saturday. They were shown over St. Michael's parish church by the Rev. John Ferguson, minister of the parish, who explained its architectural features. After dinner the company proceeded to Dalmeny Church, and subsequently visited other ecclesiastical antiquities in the neighbourhood.

The parish church of Tavistock was reopened on Saturday after restoration at a cost of £1,500. Mr. G. H. Fellowes Prynce was the architect, and Mr. J. A. Dennis, the builder.

A bronze statue of the late Mr. R. Ascroft, M.P., was publicly unveiled in Alexandra Park, Oldham, on Saturday afternoon. The cost of the memorial has been defrayed by public subscription.

The Ferryhill section of the Aberdeen Corporation Tramway system was opened on Friday. It has been completed from Crown-street to the top of Whinnhill-road. The portion from Whinnhill-road to the railway bridge is at present in course of construction, and when finished the entire route will be about one mile long. The cost of the work has been £15,000.

WATER SUPPLY AND SANITARY MATTERS.

BIRMINGHAM.—The means to relieve the Rea main sewer in order to obviate floods in the Sherlock-street district has been reported upon by the Public Works Committee of the City Council. They state that the serious flooding of property in Sherlock-street, Longmore-street, Digbeth, and the adjoining low-lying districts, occasioned by the overcharging in times of storm of the Rea main sewer, has occupied their attention for some years. The city surveyor Mr. John Price, has made a thorough investigation into the condition of the sewer, as to its capacity to meet the demands of the extremely low-lying lands draining into it during heavy rainfalls, and also as to its condition structurally. As a result he has recommended the carrying out of extensive works to remedy the present evils. It is proposed to relieve the main sewer by the construction of a system of storm-water sewers carried from the River Rea to meet each incoming branch main at such a level that the discharge is not affected by the rise or fall of the river in flood times. In certain portions of the low-lying districts it has not been found possible to adopt this system, but a system of surface-water sewers has been included in the scheme to deal with such districts. The latter scheme will take all front roof water. The city surveyor estimates that the cost of the construction of the overflows and the surface-water drainage will amount to £48,000, in addition to £2,400 for the diversion of Hope-street sewer. The committee recommend further expenditures of £1,250 for the diversion of the Salfley outfall sewer and £1,200 for a surface-water culvert in Somerville-road. The work of widening, deepening, and otherwise improving the River Rea at Nethells has been before the council on many occasions during the last fifty years, the council having at various times carried out portions of the improvement at a capital cost of £60,000. The only important length of the river not yet dealt with is that lying between a point a short distance above Erskine-street and the sewage disposal works at Salfley. In the opinion of the committee, the time has arrived when the improvement should be continued for that portion between the commencement of the Gas Committee's lands to the outfall of the millrace near the sewage disposal works. This improvement involved the purchase of the water rights of Mr. Wills, at Park Mills, who is willing to dispose of his water rights and about six acres of land for £12,600 and costs. The Corporation have been advised by Messrs. Mansergh and Sons and the city surveyor that this is the only effective course to pursue. The committee therefore recommend that they should be authorised to accept Mr. Wills's offer.

COLCHESTER.—The newly-completed system of sewage disposal for the borough of Colchester was officially inaugurated on Wednesday week. The original works were constructed in 1883, and opened in 1884—a year rendered memorable locally by an earthquake. The success of the appliances then used for the disposal of Colchester sewage was a matter of constant debate, and at length the general officer commanding the eastern district threatened the corporation with an injunction. Chemical treatment of the sewage was adopted in 1886, and carried on with uniform success; but the plant being insufficient for a rapidly increasing population, the town council resolved to extend and enlarge their works, and adopt an improved treatment of sewage. It was decided to adopt the tank system with bacteria beds of breeze for purifying the liquid, and the result has been the discharge into the river of what is claimed to be an absolutely innocuous effluent. The solid deposits in the tanks are forced by machinery into a press-house, where they are condensed into sludge, which is sold for manure. Four additional tanks, holding a total of 836,000 gallons, have been recently constructed for the reception of the crude sewage, and with the four formerly existing, the total tank capacity is equal to 1,436,000 gallons. Near the tanks are six newly-constructed filter-beds, and the mode of working provides for each filter-bed being at rest for some eighteen hours after the liquid has been drawn off from it. The breeze which forms the purifying material is laid on concrete floors, and is about 4ft. deep. On emergency, it is possible to charge these beds with a total of two million gallons per day, the average amount of sewage dealt with at the works being at present about 900,000 gallons daily. The recent additions to the sewage plant, &c., include a new press-house and engine-house, two new sludge-presses, hydraulic closing gear, pneumatic forcing receivers, and a storage receiver. The work has been carried out by the borough surveyor, Mr. H. Goodyear, at a cost of £9,692, the estimated cost being £10,000.

A Wesleyan chapel at St. Martin's, West Corn-wall, was opened last week. It has cost £1,300, and accommodates 376 persons. Mr. John O. Eva, of Helston, was the architect, and Mr. W. T. Cooke, of Mawgan, the contractor.

ILLUSTRATIONS.

NEW PREMISES IN PICCADILLY.—SCOTTISH UNION AND NATIONAL INSURANCE OFFICES, BIRMINGHAM.—SECOND PREMATED DESIGN FOR CAPE OF GOOD HOPE UNIVERSITY.—SECOND PREMATED DESIGN FOR NEW PUBLIC OFFICES, PONTYPRIDD.—HOUSE AT KELHAM, NEWARK.—RECENT ADDITIONS TO THE SOUTH KENSINGTON MUSEUM.—LIVERPOOL CATHEDRAL: SELECTED DESIGN.

Our Illustrations.

NEW PREMISES, PICCADILLY.

No particulars of this new block of premises in Piccadilly have reached us.

NEW OFFICES OF THE SCOTTISH UNION AND NATIONAL INSURANCE COMPANY, COLMORE ROW, BIRMINGHAM. Our illustrations this week include a view of the front of the above and a plan of the ground floor, the whole of which is occupied by the insurance company, together with a mezzanine over a part of it. The upper floors, let out as offices, are approached by a circular staircase with a passenger lift in the staircase well. The Colmore-row front is to be built of grey granite, with a finely axed face, so far as the lower story is concerned, above which the front is continued in Portland stone, with bands of red brick. The lower part of the large dome is covered with green Westmoreland slating—its upper part and the smaller domes being in lead. It is to be feared that for some time to come certain rights of light temporarily held by adjoining properties will prevent the building rising to the height contemplated and shown by the view we publish. Messrs. Henman and Cooper are the architects.

CAPE OF GOOD HOPE UNIVERSITY: SECOND PREMATED DESIGN.

We illustrated the selected designs for these buildings on May 29 last, and gave a view, with plans, of the third premated design also at the same time. We now show the second prize scheme submitted by Mr. J. Edwin Forbes, whose plan is quite different to that placed first. It is a straightforward and well-arranged building. The coloured view submitted in the competition was too highly tinted to come out really well, and to do this reproduction as satisfactorily as we have managed it, time was needed. The boldly projecting cornice casts a deep shadow, adding a suitable effect to the façades for its position, though otherwise the detail is somewhat uninteresting. The loggia and corridors below would help to keep the hall cool.

PUBLIC OFFICES, PONTYPRIDD: SECOND PREMATED DESIGN.

MR. S. D. ADSHEAD, the author of this prize design, says that he has nothing of special interest to say by way of description. Red brick and stone were intended, and the detail shows the type of design adopted. We gave elevations and plans of the selected scheme in the BUILDING NEWS for May 22 last.

HOUSE AT KELHAM, NEWARK.

THIS house, now in course of erection, is built of Kelham red sand-faced bricks with stone copings.

The roofs are covered with Hurlhill hand-made tiles. The drawings here reproduced are exhibited in this year's Royal Academy. Mr. Harold Bailey, A.R.I.B.A., of Newark, is the architect, and Mr. William Smith, of Newark, is the contractor.

RECENT ADDITIONS TO THE SOUTH KENSINGTON MUSEUM.

THROUGH the benevolence of well-disposed persons the fine collection of art treasures at the South Kensington Museum is from time to time still further enriched. Amongst the later additions is the Woodcroft bequest, consisting of some excellent specimens of Late 17th-century Chairs. The two chairs shown in the sketches are of oak and walnut wood respectively, with high back of scroll design and fittings of cane. The arms in both instances are scroll-shape, the legs are turned and tied together with stretchers; the oak chair has the addition of a scroll in front, with velvet seat, and fringed. The seat of the walnut chair is of cane. The cupboard stands about 5ft. high, 4ft. 6in. wide, by 1ft. 6in. deep. The whole front is divided into six panels, with door in centre; the panels are moulded and carved out of the solid. The hinges are of wrought iron, the handle of more recent date. This cupboard is also of oak.

LIVERPOOL CATHEDRAL: SELECTED DESIGN.

THIS transverse section through the nave of the cathedral shows the side elevations of the towers and of the so-called transepts, or, more properly speaking, gabled dormers, which divide the nave longitudinally into compartments, shown by the section given in the BUILDING NEWS for June 12. Last week we illustrated the two end elevations of the building, and the plan and main side to St. James-road appeared in our issue for May 29. Mr. G. Gilbert Scott and Mr. G. F. Bodley, R.A., are the joint architects.

CHIPS.

We regret to learn of the serious illness of Mr. Greville C. Hems, son of Mr. Harry Hems, of Exeter. Mr. Hems, who is suffering from a painful complaint, has undergone an operation, but is still in a serious condition.

A new folding map of the Republic of Peru, on a scale of forty miles to the inch, with a short description of the country—its features, resources, and means of communication—has just been published by Don Eugenio Larrabure y Unzué, the Minister for Foreign Affairs, and may be obtained of Mr. Edward Higginson, Canute-road, Southampton, the Consul for Peru. An inset map of England and Wales to like scale enables one to grasp the vast area covered by this thinly-populated territory.

A second section has been added to the Church of St. John at Gainsborough, and was dedicated last week by the Bishop of Lincoln. The first portion was built in 1881-2, from plans by Mr. J. T. Micklethwaite, F.S.A., of Westminster, and consisted of six bays of the nave and chancel, but without the clerestory. Three more bays have now been added to the nave, also from Mr. Micklethwaite's designs, and the church now seats 800 persons.

The Ordnance Survey have recently published a folding pocket map of Glossop and the surrounding district on the scale of one inch to the mile. The map is printed in colours on sheets 18in. by 12in., mounted on canvas, in a cover. It is in outline with contours, the hill features being printed in brown. It includes the two routes over the Pennines from Mottram to Penistone and from Greenfield to Holmfirth, Glossop just coming into the south-west corner of the map. Unfortunately, every country road paved with setts, however bad, is marked first-class, there being little discrimination as to the character of the surface from the cyclist's or driver's viewpoint.

Messrs. Andrew Handyside and Co., Ltd., of Derby and London, have obtained the contract for the supply of two swing-bridges for the Cardiff Railway Company. One bridge will carry two lines of rails and two roadways over the communication passage of the South Dock, Cardiff, and the smaller bridge will carry a single line and one roadway over the entrance lock.

MR. J. C. Inglis, the chief engineer, has been appointed the general manager of the Great Western Railway, in succession to the late Sir Joseph L. Wilkinson.

A receiving order has been made in the case of Walter George Brown (formerly carrying on business under the style or firm of G. Brown and Son, and latterly as Walter G. Brown), Leicester, contractor; and also in that of Joseph Molyneux, St. Helens, Lancashire, builder.

STATUES, MEMORIALS, &c.

ADELAIDE, S.A.—Captain Adrian Jones has been invited to execute for the people of Adelaide an equestrian memorial to the contingent which, going from that city as part of the Australian force, rendered good service during the war in South Africa. The sculptor has chosen as his subject a member of the Adelaide Contingent engaged as a scout, and the trooper is depicted in the act of suddenly reining in his charger as he sights the enemy across the rocky veldt. The whole figure stands 11ft. 6in. high. Next week the plaster cast will be removed to Thames Ditton, there to be cast in bronze, and when the memorial has been completed, it is to be shipped to Adelaide for erection upon a granite pedestal in one of the public squares of that city.

THE WELLINGTON MEMORIAL IN ST. PAUL'S.—A further stage towards the completion of the Wellington Monument in St. Paul's Cathedral has now been reached, Mr. Tweed's model of the equestrian statue which is to surmount the whole having arrived within the building. During last week workmen were engaged in erecting a scaffolding in the north-west bay adjoining the monument, and when the plaster model was brought to the Cathedral it was hoisted on to a lofty platform on a level with the summit of Alfred Stevens's marble and bronze memorial, to be transferred thither when the preparations for its reception are completed. There this work of Mr. John Tweed, the sculptor, commissioned by the committee to complete the monument, and based upon Stevens's model, long stowed away in the Cathedral crypt, will remain for the public to judge of its effect before it is finally cast in bronze.

At the last meeting of the city council of Exeter, a letter was read from Mr. James Jerman, F.R.I.B.A., of Bedford-circus, a member of St. David's Ward, resigning his seat in consequence of his position as architect to the Exeter School Board. He inclosed five guineas. A resolution was adopted declaring the vacancy. Messrs. J. A. Loram, A. T. Oliver, J. Stocker, E. C. Perry, W. Wreford, and the Mayor joined in the regret at Mr. Jerman's resignation, and it was decided to enter a record of his services in the minutes.

The pavilion and concert-hall at the seaward end of Cleethorpes pier, together with a considerable portion of the pier itself, were destroyed by fire on Monday. The structural damage done exceeds £5,000, and the season's takings are also, of course, lost.

In connection with the improvements at the Port of Dover for shortening the cross-Channel passage, two new electric cranes have just been installed. These cranes, the equipment of which has cost £11,000, have been constructed to the design of Sir William Preece and Messrs. Siemens. They command both sides of the Admiralty Pier, and have involved very large structural additions. The cranes are to be used for the transhipment of mails and baggage in specially-built crates capable of containing 2½ tons. Under the new system, which came into operation on July 1, coincident with the advent of the turbine steamer, a great saving of time is effected. Electrical cranes have also been erected at Calais, and the mail steamers have been specially altered for the shipping of the crates.

A large new clock has just been erected upon the church tower, Beadnell, Northumberland, in commemoration of the Coronation. Messrs. John Smith and Sons, Midland Clock Works, Derby, have carried out the work, and they are also just completing a similar clock for Colnbrook, near Windsor.

The formal opening of the new buildings on the hills above Faugbonnre, to which Clayesmore School has moved from Enfield, took place on Saturday. The Clayesmore estate is over 200 acres in extent, and, including the schoolhouse, has been acquired for the school by a limited liability company, the purchase price being £30,000.

On Thursday last week the new reredos which has been placed behind the holy table of the Lady-chapel of St. Petros Church, Little Petherick, was dedicated. It has been given as a memorial to the late rector, the Rev. H. S. Barker. The reredos was carved from the drawings of Mr. J. N. Comper, of London, and contains figures of the Blessed Virgin and Holy Child, SS. John the Evangelist, Petros, Francis of Assisi, and Antony of Padua. It is richly coloured and gilt.

The first school completed under the auspices of the city corporation of Bristol was opened on Monday night. It is a junior mixed institution in Mina-road, and has been built from plans by Mr. H. Dare Bryan, of Bristol. Mr. George Humphries having been the contractor. The total cost was £8,228.

The sales at the Mart last week, as registered at the Estate Exchange, amounted to £166,035. For the corresponding week of last year the sum was £30,720.

A detailed floor plan of the first floor of the National Theatre. The central feature is the 'THEATRE' (auditorium), which is semi-circular with tiered seating. To the left of the theatre is the 'LOBBY' and a 'CLOAK ROOM'. Above the lobby is the 'COMMITTEE ROOM'. To the right of the theatre is the 'STAGE' area, which includes a 'STAGE BOX' and a 'STAGE' area. Further right are the 'EDUCATION' and 'GENERAL' rooms, and a 'PRIVATE' room. At the top of the plan are the 'CLERK' and 'CLERK' rooms, the 'THE COUNCIL' and 'DEPUTY CLERK' rooms, the 'DEPARTMENT' and 'CLERICAL OFFICE' rooms, and the 'STAFF' and 'LAVATORY' rooms. The plan also shows various corridors, stairs, and smaller rooms like 'TOILET' and 'W.C.'.

A detailed floor plan of the interior of the Lincoln Barracks. The plan shows a central corridor with rooms on either side. The rooms are labeled as follows:

- ON SUBJECTS PRIVATE
- THE PUMP GENERAL
- STORES ROOM
- DEBARS OFFICES
- GAS CHAMBER
- DEPART SERIAL
- STAFF LAVATORY
- ENTRANCE
- SERIAL BOARD
- MEDICAL OFFICE
- SURRENDER OF RESERVES
- TRAINWAY GENERAL
- DEPART MANAGER
- KITCHEN

The plan also shows several smaller rooms and a large central hall.

LEGAL INTELLIGENCE.

NIDD VALLEY ARBITRATIONS.—Lieut.-Colonel W. H. Wellsted, C.E., the umpire in the matter of *T. E. York v. The Bradford City Corporation*, has just issued his award, amounting to £15,708. The claim was in respect of 848 acres of freehold land in the Nidd Valley taken for the construction of the Angram Reservoir, and the mineral rights and sporting over other 6,031 acres, and amounted to £70,696, whilst the value placed upon it by the corporation witnesses was £7,470. The arbitrator for the claimant was Mr. Thos. Fenwick, C.E., Leeds, and the witnesses were Messrs. C. R. Fenwick, W. B. Boord, John Maugham, Richard Horsfall, W. F. Tempest, and John Farrah. The arbitrator for the Bradford Corporation was Mr. Chas. Gutt, C.E., Bradford, and the witnesses were Messrs. Fredk. Fowler, W. B. Woodhead, R. B. Broster, and George Runtun.

"SUPERPOSED SEMI-DETACHED RESIDENCES."—*THE ILFORD PARK ESTATES (LIMITED) v. JACOBS.*—Mr. Justice Swinfen Eady has given judgment in a motion by the plaintiffs for an injunction to restrain the defendant, her servants, agents, or workmen from erecting on certain lots in Brisbane-road, Ilford, Essex, more than one house within the meaning of a covenant contained in a conveyance dated November 14, 1898, and made between the plaintiffs and the defendant, or any house of less value than £300, or any building whereof the elevation had not been approved in writing by the plaintiffs' surveyor upon any one of the lots. By the conveyance in question the plaintiffs conveyed to the defendant certain hereditaments and premises forming part of the Ilford Park estate at Ilford, on the east side of, and having a frontage to Brisbane-road of 51ft., and shown on a plan and numbered lots 563, 564, and 565. The conveyance contained a covenant by the defendant to observe, perform, and abide by all the stipulations contained in the schedule thereto so far as they related to the premises thereby conveyed. The schedule, by clause 2, provided that no trade, business, or manufacture should be carried on upon any lot except those lots fronting Ley-street. Clause 3, which provided as to the value of the buildings to be erected, was as follows:—"No house shall be erected fronting any road of less value than stated in the schedule hereunder, the value to be calculated at net prime cost exclusive of the land. Not more than one house shall be erected on any lot." Then, as regarded Brisbane-road, the minimum value was stated to be £300 each house. Clause 10 provided that no building should be erected on any part of the land save where the elevations had been submitted to and approved in writing by the plaintiffs' surveyor, and a copy of the design deposited with the surveyor. It appeared that the defendant, intending to erect certain buildings, submitted first of all an elevation and then an amended elevation of the proposed buildings to the plaintiffs' surveyor, which the latter refused to approve. No elevation had, therefore, been approved as required by clause 10. The buildings were to consist of two floors. On the ground-floor was one complete tenement with its own front door. On the upper floor was another complete tenement. Access to the upper floor was obtained through a separate front door opening on a staircase, which was divided by a brick wall from the ground-floor tenement. The two front doors were side by side, set back in an archway. The plaintiffs' surveyor alleged that these buildings, which the defendant was now proceeding to erect, were a breach of the stipulation contained in clause 3 of the schedule. Mr. Justice Swinfen Eady, in giving judgment, said the question was whether the defendant was committing a breach of the covenant contained in the deed of November 14, 1898. The contention on behalf of the plaintiffs was that the defendant was putting up on one lot two houses which were separated horizontally and not vertically. It was not disputed that, if the defendant were erecting two semi-detached houses vertically separated, they would constitute two separate houses, but it was contended that the building was in reality only one house. There was no internal communication between the ground floor and the first floor; there was no common staircase, as the ground floor did not require a staircase; and there was no common front door, but separate front doors for each of the two tenements. In order to pass from one house to another it was necessary to pass out of the front door of one tenement to a space which opened upon the street and to enter the front door of the other. The language in which Lord Brampton in "*Grant v. Langton*" (1900) described the building there in question was exactly appropriate to describe the building in the present case. At page 399 he said: "One roof covers the whole building, but each story is so structurally completed and arranged for permanent occupation by a separate occupier that there is no internal communication of any kind between the two stories, nor any common staircase or access to or from the street, or from any part of the outside of the premises, each having a separate entrance or entrances therefrom. In short, it would be im-

possible to erect two separate houses under one roof or to divide one building into two distinct and separate houses more completely than has been accomplished in the building now under consideration." Now, the question was whether each of these buildings constituted one or two houses. On the one hand, reference was made to the cases of blocks of flats. The first case was that of "*Kimber v. Admans*" (1200), before Mr. Justice Cozens-Hardy and the Court of Appeal, where the defendant had erected blocks of flats on the plots purchased by him subject to similar restrictions to those in the present case. There it was contended that each flat in a block of flats was a separate dwelling-house; but Mr. Justice Cozens-Hardy held that each block of flats constituted only one house. He said: "That which it is proposed to erect seems to me to be a house of the value of more than £500, and none the less a house of that value because it is proposed to be used as a series of flats." On the other hand, reference was made to "*Rogers v. Hosegood*" (1900). There was no question here of one house being built and being intended to be used as two. In substance there were here two houses structurally separated in every respect, with separate doorways into the street, and with no internal communication. It was different from the case where a building was erected and intended to be used for flats. In that case there was internal communication. Here there was none. It appeared to his Lordship that there was here merely one house superposed upon another house and divided horizontally. It was stated that with certain modifications of the plans the building could be converted into flats. Whether that could be done or not was not for his Lordship to say. In his Lordship's judgment each building constituted two separate houses, and was a direct breach of the covenant in the deed of November 14, 1898. There would, therefore, be an injunction in the terms of the notice of motion.

"WALNUT" FURNITURE.—His Honour Judge Parry had before him at the Salford County-court, on Monday, a case in which the question to be decided was whether or not a bedroom suite of furniture was of the description and quality represented at the time it was purchased. The plaintiff was Philip Hart, trading as Philip Hart and Company in Oldham-street, Manchester, as furniture dealer, and the defendant was William Greenwood, of Tenerife-street, Higher Broughton. The plaintiff's case was that he sold part of a bedroom suite to the defendant, who, however, wished to send them back, being dissatisfied because it was not entirely of walnut. Plaintiff contended that it was the universal custom of the trade to give the description of walnut to goods which had a walnut exterior, but were constructed of other woods in the inside portions. It was stated that the cost of the furniture had been walnut throughout would have been £80 or £70, and the cost of that sold to the defendant was £15 18s., which was the amount claimed in the action, the defendant having refused to pay. The defendant stated that the pieces of furniture which he saw at the plaintiff's place and purchased were secondhand, but the goods sent to him were not the same. The plaintiff guaranteed them to be of solid walnut, but they were actually made of four different woods. Defendant was of opinion that the outside of two stands were the same as he purchased, but different drawers had been put in. Judge Parry, in giving judgment for the defendant, commented strongly on the trading methods of some furniture dealers. If goods of such description were labelled "solid walnut," the sellers would be liable to prosecution under the Merchandise Marks Act for using fraudulent marks, and heavy penalties might be imposed. Some dealers did not seem to have learnt of the Act or of its principles, and he regretted that there seemed to be a certain section in the trade who would describe as walnut that which was a mixture of walnut outside and inferior woods inside. This, he thought, was nothing but a fraud, and the only reason for describing them thus must be to defraud the public and try to persuade them that they were buying something which they were not really getting. It was expressly to stop such practices that the Merchandise Marks Act was passed. Judgment was given for the defendant, with costs on the B scale.

RE GEORGE WILLIAM DORKING.—The debtor, a builder, of Kidderminster, came up for his adjourned examination at Kidderminster on Monday, before Registrar Talbot. His statement of affairs showed liabilities of £7,539, expected to rank £2,831, deficiency £911. Debtor was examined as to his building undertaking at Hill Grove-crescent. Questioned as to certain payments made to his wife, he said they were for household expenses. Debtor denied that he had kept books, a denial which the Registrar said he doubted. Debtor said there was a marriage settlement when he was married, and a draft was submitted to him, but he did not read it particularly. He admitted that some writing on the margin of the draft settlement was in his hand, which drew from the Registrar the remark that debtor said at the last examination that he never saw the settlement. Debtor: I never saw

the original. The Registrar said debtor swore he did not see the draft and did not know whether he had a life interest in the property under the settlement. Debtor said what he wrote on the settlement was at the dictation of his wife, and the trustee's solicitor said the effect of it was to give debtor a life interest in the property. The Registrar said he was very dissatisfied with the debtor's answers. Debtor denied that he had a considerable sum when he went away from Kidderminster, before the receiving order was made; he only had about £10. He was now living in London in the name of Templeman. The examination was adjourned for a fortnight.

RE HENRY PLASCOTT.—This debtor, whose examination took place last week, is described as of the Bargate Hotel, High-street, Southampton, licensed victualler, and trading at the Cattle Market, Southampton, under the style or firm of Plascott and Son, as contractors. The petition was filed by the debtor himself on May 30, the receiving order being granted, and the debtor was also adjudicated bankrupt. The alleged causes of failure are loss on contract now current in consequence of coming across unexpected springs and running sand, necessitating an expenditure of over £3,000 instead of £200, as estimated. The statement of affairs, as officially furnished, shows (in summary) a gross indebtedness of £11,237 7s. 1d., of which £11,062 13s. 4d. is expected to rank for dividend, the assets being set down at £5,862 13s. 2d., the deficiency being £5,200 0s. 2d.

CHIPS.

A Corinthian column of granite 105ft. high, surmounted by a bronze figure of Victory 12ft. high, standing upon a globe, the whole intended as a monument to Admiral Dewey, the figure by Robert I. Aitkin, and the architectural design by Newton J. Thorp, was unveiled in San Francisco during President Roosevelt's recent visit there.

The Duke and Duchess of Life visited Epsom on Wednesday for the purpose of opening the epileptic colony, which has been built on the Horton estate by the London County Council. The colony has been erected with the idea of the better housing, treatment, and employment of the insane epileptics from the asylums. The plans of the buildings, which are estimated to cost £93,000, were made by Mr. W. C. Clifford Smith (engineer to the Asylums Committee) in conjunction with Dr. C. H. Bond, medical superintendent. The colony stands on 112 acres of the Horton estate, on which the Manor Asylum with 700 females and the Horton Asylum with 2,000 patients have been erected by the County Council. The buildings comprise an administrative block and eight villas, in which provision is made for 266 males and 60 females.

Messrs. Newsum's soft wood sawmill, situate on Trent Bank, Gainsborough, was destroyed by fire on Wednesday night. The loss is estimated at £20,000. The mill, which measured 180ft. by 90ft., contained a quantity of costly machinery. Fourteen months ago works on the same site were burned, and the damage then amounted to £8,000.

The committee of management of the City Orthopaedic Hospital are carrying out considerable improvements and additions to the premises in Hatton Garden, consisting of new isolation ward, registration and consulting rooms, and nurses' cubicles. The architect is Mr. F. T. W. Goldsmith, A.R.I.B.A.

The new science block of St. Peter's school, York, erected at a cost of about £1,000, was opened on Tuesday by Dr. Allbutt, F.R.S., Professor of Physics in Cambridge University, an "old boy" of the school.

Mr. H. T. Steward, surveyor, Whitehall, has just issued his award as sole arbitrator in the case of *A. J. Russell v. the War Office*, an arbitration in respect of 92 acres of land at Plumstead, which the War Office have compulsorily acquired for the purposes of the extension of Woolwich Arsenal. The claim was for upwards of £10,000, and the arbitrator has now awarded the sum of £12,675.

Mr. William Collingwood, honorary member of the Royal Society of Painters in Water Colours, who was elected to the society so long since as 1855, but had been living in retirement for some time, died last week at his residence, Rosslyn, Abbotsford-road, Bristol, at the age of eighty-four. For 45 years Mr. Collingwood was a teacher of art at Liverpool, as well as practising the profession of an artist. He devoted himself in the earlier portion of his career chiefly to the reproduction of baronial and other interiors, and in his later years to Alpine landscapes. Forty years since he published a volume of lectures on "*The Value and Influence of Art in General Education*."

Mr. Robert Garnett, of Penketh, and of Messrs. Robert Garnett and Sons, of Warrington and Penketh, cabinetmakers, who died in April last, aged 73, left estate of the gross value of £81,907, with net personality £65,866.

Our Office Table.

MR. W. ALFRED GELDER, one of the new knights created in commemoration of the King's birthday, is the senior partner in the firm of Gelder and Kitchen, architects, Hull, and is a Fellow of the Royal Institute of British Architects and of the Surveyors' Institution. Sir Alfred Gelder has been intimately associated with the municipal life of Hull for a long time, and he is now enjoying the very rare distinction of filling the mayoral chair for the fifth year in succession. He is the first citizen during the last 600 years to be mayor of the old port for five years without a break. Sir Alfred is a comparatively young man, and his labours as a member of the corporation have been chiefly directed to the wiping out of slum property and the creation of new streets. The improvement of Hull in this respect during the last few years has been remarkable, and it is to the credit of the new knight that he has taken a very prominent part in bringing about the much-needed improvements. The new street upon which the proposed new municipal buildings for Hull are to be erected is named after him. The King has also conferred the companionship of the Imperial Service Order upon Mr. Henry Tanner, F.R.I.B.A., F.S.I., the principal architect of H.M. Office of Works, and upon Mr. Robert Cochrane, F.S.A., F.R.I.B.A., of Dublin, principal surveyor under the Irish Board of Works. The following letter was sent to Downing-street in reply to one from the Prime Minister:—"5, Orme-square, Bayswater, W., June 24. Dear Mr. Balfour,—I beg to acknowledge the receipt of your letter of yesterday wherein you say that the King has graciously signified his intention to confer on me the honour of knighthood on the occasion of his birthday, and for which I feel greatly thankful. Possibly his Majesty may not be aware that the Queen, his mother, graciously offered me a similar distinction many years since, and that, after expressing my gratitude, I humbly declined the honour, and which I again ask leave to do. At the same time I feel abundantly thankful for his Majesty's considerate remembrance of me, and remain yours faithfully, J. PASSMORE EDWARDS."

THE Ancient Lights Bill, the result of the labours of a joint committee of the Royal Institute of British Architects and the Surveyors' Institution, has been introduced by Mr. Fletcher Moulton, K.C., Mr. Robson, Mr. H. D. Greene, and Mr. Herbert Robertson, and was read a first time in the House of Commons on June 22; but, unfortunately, in the present congested state of business, so useful and practical a reform has no chance of becoming law. The measure has, as its full title, "An Act for Amending the Law Relating to Easements of Light," and it consists of eight parts and some twenty-seven clauses. Part I. provides that its operation is to be restricted to England and Wales, and Part II. consists of half a dozen definitions. Part III. deals with the limitations of the amount of light of a dominant owner, and Part IV. provides for the obstruction of an accruing light easement by notice in place of the existing clumsy mode of physical obstruction. Part V. provides that no title by presumption shall be acquired to light passing over a tenement on the opposite side of a street. Part VI. makes elaborate provisions for certificated plans of buildings about to be taken down, which will be of great interest to "official surveyors," by which term are described district surveyors in London, and county or borough surveyors elsewhere. Part VII. regulates the statement of claims arising out of rights to light, and is the most verbose of all, and Part IX. provides for the construction of a tribunal of appeal, consisting of nine members, to be appointed in equal proportions by a Secretary of State, the R.I.B.A. Council, and the Surveyors' Institution Council.

THE arrangements for the International Fire Prevention Congress, to be held next week at Westminster, convened by the British Fire Prevention Committee, have now been completed in detail. The congress membership will comprise over 800 professional men—mainly engineers, architects, and surveyors—together with a large number of fire brigade officers and municipal councillors and public officials, representing all parts of the United Kingdom, as also the colonies and the principal foreign countries. The congress will be conducted in general meeting and

in sectional gatherings, the whole of the technical arrangements being in the hands of Mr. Edwin O. Sachs as executive chairman, and there will be six sections, each of which will have its own colonial or foreign chairman and an English acting vice-chairman. The seat of the congress will be the Caxton Hall, Westminster, where all meetings, except the opening meeting, will be held, and the detailed arrangements there will be in the hands of Mr. Ellis Marsland, M.S.A., as hon. general secretary, and Mr. Sheppard, as hon. meeting secretary. The general opening meeting, timed for 11.45 a.m. Monday, July 6, will be at the Empress Theatre, Earl's Court, lent by the executive of the International Fire Exhibitor, and the Lord Mayor will open the congress. Four sections will meet simultaneously on Tuesday, Wednesday, and Thursday to read and discuss papers. The entertainments include a congress banquet to the colonial and foreign visitors on Wednesday, July 8, presided over by the Duke of Marlborough. There will be several evening entertainments, such as a *conversazione* and reception. The congress offices until the opening of the congress are at No. 1, Waterloo-place, S.W.

THE half-yearly return of the Works Committee of the London County Council covering the cost of works completed by the works department during the half-year ended March 31 last, has just been presented to the Council. It discloses some large and serious losses, mainly in connection with the erection of Horton Asylum, Epsom, and already fully discussed in the Council. The return deals with twenty estimated works, the final estimate for which was £591,790, while the actual cost has turned out to be £638,531, or a balance of cost above final estimate of £46,741. On only four of the works is any excess of cost over estimate shown, but in these cases the excess is £36,535. The cost of the building of the superstructure of the Horton Asylum has exceeded the estimate by £37,878, the final estimate being £291,165 and the actual cost £329,043. The erection of a central electric lighting station for the same asylum has resulted in an excess of cost over estimate of £1,977, on a job estimated to cost about £14,000. The provision of an "epileptic colony" on the Horton estate, as an adjunct to the asylum, has resulted in a balance of cost above estimate of £5,018. The other loss, which amounts to £11,617, is on the construction of the Hackney Wick relief sewer. This work was estimated at £125,329, and has actually cost £136,946. With regard to this work, the committee do not think that the ultimate cost is excessive, having regard to the difficulty of estimating accurately. A great deal of difficult work was encountered, and much pumping was necessary. The remaining sixteen works embraced in the return all show a balance of cost below estimate, the aggregate saving amounting to £9,791. The jobbing works executed by the committee during the half-year have resulted in a balance of cost below schedule value of £1,334. The committee state that the number of works referred to them for execution and not included in the present return was forty-one, representing an estimated expenditure of, approximately, £739,000; but they did not anticipate an excess of cost over accepted estimate in respect of any works where the accepted estimate was over £1,000.

AT a meeting of the London sub-committee of the Irish Landowners' Convention, held on Monday, Sir Thomas Butler presiding, it was unanimously resolved to recommend to the favourable consideration of the Government the position and claims of the Irish land agents on the ground that this class is a body of professional men of conspicuous ability, honourable antecedents, trustworthy characters, and possessing wide and varied experience in all practical business relating to the management of estates in Ireland. In forwarding this resolution to the Prime Minister and Mr. Wyndham, the meeting agreed to inclose a statement to the effect that the land agents of Ireland have rendered great services in the cause of law and order during troublous times and in trying circumstances; have always freely co-operated with the Executive Government to preserve peace in their respective districts; and have expended large sums of money in qualifying for their profession and in buying practices and partnerships. The statement suggests, moreover, that if for Government purposes it becomes necessary to legislate for these gentlemen, whose sole occupation, it is alleged, will be extinguished as a result of the

successful working of the law, "it would then appear as if the dictates, not only of justice, but of expedience, would point to compensation of some kind being provided by the State." A deputation from the Irish land agents were received on Tuesday in a committee room at the House of Commons by a number of members of Parliament representing all shades of political opinion. The deputation having expressed their views, a resolution was unanimously agreed to, expressing the opinion that the Irish land agents were entitled to compensation in the event of their being disemployed as a result of the Land Bill, and urging on the Government their claim to favourable consideration. Later in the evening Sir W. Hart Dyke communicated the resolution to Mr. Balfour and Mr. Wyndham.

THE Architectural Vigilance Society, of which Lord Windsor is the chairman, and of which Mr. Aston Webb, Professor Beresford Pite, Sir E. J. Poynter, and Sir W. B. Richmond are prominent members, have passed a resolution regretting that the competition of three years since for designs for the architectural treatment of the Strand-to-Holborn thoroughfare has been allowed to be without practical issue, and that, through the recent decision of the London County Council on the report of the Corporate Property Committee on the subject of the Holborn-to-Strand improvement scheme, there seems a prospect of the lessees being allowed to exercise their individual taste in building houses on this site. They suggest that, in view of the great importance of not letting slip so unique an opportunity for carrying out an architectural scheme of a dignified character (and failing the original proposition involving a uniform treatment of the whole site), the suggestion of the Corporate Property Committee that the work of designing the blocks (including the treatment of the crescent as a symmetrical whole) be intrusted to a selected number of architects should be reconsidered, with a view to its adoption by the Council.

AT a meeting of the general council for the Hampstead Heath extension scheme, held on Friday, under the presidency of Mr. G. J. Shaw Lefevre, a resolution was passed unanimously to the effect that steps should be taken to raise £48,000 for the purpose of acquiring 80 acres of land, offered by the Eton trustees at £600 an acre, lying on the north-west boundary of Hampstead Heath. Among the reasons urged for this were that the view from the Spaniards-road and the north-west heath would be retained; that if these fields could be kept as an open space, the thousands of people who will, it is hoped, be brought by the Tube would be landed at once in the midst of the country; that the development of the Tube and electric tramways will bring a large population to inhabit the neighbourhood of Finchley-road; and that there is a great and growing need for playing fields within a short journey of the Metropolis, and that parts of the proposed space might be made fit for games. Towards the required sum promises to the extent of £3,000 have already been received.

ON Saturday last Messrs. Eastwood and Co. invited the President, Council, and Members of the Incorporated Association of Municipal Engineers to their works at Conyer, to view the plant for making, drying, and burning stock bricks by Moller and Pfeifer's system, which we recently described (p. 648, Nov. 7, 1902) at some length. The guests, to the number of about two hundred, were conveyed by special train to Teynham, whence a pleasant drive brought them to Conyer, and, after a tour of inspection of the works, back to Sittingbourne, where they were entertained at lunch in the town-hall. The visitors, amongst whom were several practical brickmakers, were evidently greatly impressed with the new system, of which Messrs. Eastwood and Co. are the pioneers and agents in this country, and expressed themselves as highly pleased with their visit, whilst sympathising with Mr. Wragge and the members of the firm in the loss they had sustained by the death of Mr. Henry J. Byrne, Mr. Wragge's private secretary and head of the staff. We are asked to acknowledge the sum of two guineas collected during the return journey in aid of the Orphan Fund of the Municipal Engineers.

THE excavations being conducted for about ten days under the auspices of the Somersetshire Archaeological Society, at Castle Neroche, near Staple Fitzpaine, were commenced on Monday. The owner (the Viscount Portman) gave permission for the work, and, through the instru-

mentality of Mr. E. C. Treppin (his steward), he has given the society the services of four labourers. About six men are engaged on the work, which is carried out under the direction of Mr. H. St. George Gray, the society's curator. A section 10ft. wide is being dug through the ramparts and ditches on the south-west side of the great camp. Next week some excavations will take place on "the Beacon," towards the north. The distance to Neroche from Taunton is $7\frac{1}{2}$ miles by the Chard-road. It is the intention of the Archaeological Society to visit Castle Neroche on Wednesday, the 29th inst., during their annual meeting at Chard.

Mr. HENRY W. STOCK, F.R.I.B.A., writes pointing out that the increase of dwellings in the Lake District is adding seriously to the pollution of the waters, while steamboats cover the surface of Windermere for miles with ashes blown from their furnaces. A Local Government Board inspector is, he says, about to hold inquiries at Windermere into a sewage scheme, and, says Mr. Stock, "like his predecessor, will no doubt recommend the granting of the necessary loan to enable all the additional sewage of this fast-growing neighbourhood to be poured on to the saturated land by Parsonage Bay, Bowness-on-Windermere, where already the shore is fouled by black sewage ooze, and the reeds grow more rankly year by year in the shallows, and over all a fetid smell poisons the air along the pleasant walk to the Ferry. Half the charm of lake and river is derived from the purity of their waters, and Windermere and Bowness, with all their well-to-do residents, can well afford the extra cost of buying moorland away back from the lake, and pumping and treating the sewage there, as is done at other places where low rates are not allowed to be the paramount consideration."

At Friday's meeting of the Holywell Rural District Council a letter was read from a firm of solicitors, stating that they would be making application in the next Session of Parliament for power to construct and work a system of electric trams over a circular route, with headquarters at Connah's Quay. It was proposed that the tramways should be worked on the trolley or overhead system, power being drawn from the central power station, which will be erected by the North-Western Electricity and Power Gas Co. in the near future to afford a supply of electricity for that portion of their area of supply which comprises part of the county of Flint, the advantages to be derived from a cheap supply of power being thus obtained. The route selected passed from Sandcroft through Queen's Ferry, Connah's Quay, Flint, Bagillt, Holywell, Northop, Mold, Buckley, Hawarden, and back to Connah's Quay. A resolution was passed promising to support the scheme to the fullest extent.

The retirement of Professor William R. Ware, for twenty-two years the distinguished head of the Architectural Department of Columbia University, with which he is still to maintain a connection as Professor Emeritus, is announced by the *American Architect*, which adds: "Probably no architect in the United States is so well known to the community, as well as to his brother architects, as Professor Ware. Years ago, before there was any architectural school in this country, Mr. Ware, then in the active practice of his profession, admitted to his office in Boston a few pupils. On the establishment of the Architectural Department of the Massachusetts Institute of Technology, in 1867, he was immediately placed at its head. For sixteen years the Department prospered under his care, and on the formation of the Architectural Department of Columbia University, Professor Ware was immediately called to do for it what he had done for the Institute of Technology, but in a wider field, and with more ample resources; and the great School of Architecture of Columbia University is the result of his labours. For many years Mr. Ware has been called as assessor in nearly all important competitions, and the influence which he has steadily exerted in favour of fair dealing in such contests has been of incalculable value to the architects of the country."

A report has been published by the Russian Ministry of Agriculture and Domains on the working of the State forests during 1901. The gross revenue derived from this source is given as 57,486,900 roubles, or six millions sterling, of which 54,546,029 roubles resulted from the sale of forest products, an increase of 384,258 roubles compared with the previous year. The forest lands under the general forestry administration

on January 1, 1901, covered a total area of 642,403,400 English acres, consisting of 12,520 different forests, an area which was augmented during the year by 2,489,292 acres, principally in Asiatic Russia. On the other hand, forest under the desmesnial forestry administration showed a total diminution of 638,858 acres, the result of a revision of the forest boundaries.

MEETINGS FOR THE ENSUING WEEK.

MONDAY.—International Fire Prevention Congress. Opening Meeting at the Empress Theatre, Earl's Court. 11.45 a.m.

TUESDAY.—International Fire Prevention Congress at Caxton Hall, Westminster. General Meeting, 10.15 a.m. Sectional Meetings, 11.15 a.m. to 1.30 p.m.

Sanitary Congress Opens at Bradford.

WEDNESDAY.—International Fire Prevention Congress at Caxton Hall, Westminster. General Meeting, 10.15 a.m. Sectional Meetings, 11.15 a.m. to 1.30 p.m. Reception of Colonial and Foreign Delegates at B.F.P.C. Testing Station and Experiments, 3.30 to 6 p.m. Congress Banquet at Criterion, 7.30 p.m.

Sanitary Congress at Bradford. 9.30 a.m. to 2 p.m.

THURSDAY.—International Fire Prevention Congress at Caxton Hall, Westminster. Sectional Meetings, 10.15 a.m. to 12.30 p.m. General Meeting, 12.30 to 1.30 p.m. Demonstration of Experiments at B.F.P.C. Testing Station, 3.30 to 6 p.m.

Sanitary Congress at Bradford. 10 a.m. to 2 p.m. Lecture by John Slater, B.A., F.R.I.B.A., on "Architecture in its Relation to Hygiene." 8.30 p.m.

THE ARCHITECTURAL ASSOCIATION.

JULY 10th: THIRD SUMMER VISIT—to Great Tangley Manor, Chisleworth, Franciscan Monastery, Church at Blackheath, Surrey, by Mr. C. HARRISON TOWNSEND and St. John's Seminary, Woking, by Mr. F. A. WALTERS. Train leaves Charing Cross at 2.6 p.m. and returns from Chisleworth at 7.56 p.m. P.O. for 4s. 6d. to be sent to the Secretary, 55, Great Marlborough-street, W., not later than THURSDAY, July 9th.

Members will oblige by forwarding changes of address to the Secretary for insertion in the new flower book.

H. P. G. MAULE } Hon. Secs.
H. TANNER, Jun. }

CHIPS.

On Monday the Bishop of Derby (Dr. Were) conducted the service at the opening and dedication of St. Alban's church, in Holly-road, South Retford. Mr. Hodgson Fowler was the architect, and Messrs. Bowman and Son, of Stamford, were the builders. £2,800 has been spent upon the fabric, which consists at present of chancel and choir and side aisles, whilst at the rear there is a large parish-room.

The south side of the parish church of Marton-in-Chirbury has just been beautified by two stained-glass windows. One represents the Light of the World, and the other depicts the mother of Timothy teaching him the Scriptures. The artist is Mr. John Davies, Wyle Cop, Shrewsbury. A short time ago a three-light window was placed in the chancel by Mr. Davies, representing the Baptism, Crucifixion, and the Ascension.

The Lieutenant-Governor has sanctioned the commencement of the new port works in Rangoon. A sum of Rs.5,16,724 is to be spent on reclaiming foreshore and providing pitched slope. Three new pontoon landing stages are estimated to cost Rs.5,11,296 and transit sheds, a trestle bridge, and tramway are estimated to cost a further sum of Rs.1,05,000.

A new refuse destructor was inaugurated at Heywood last week. It has cost £5,000.

Two days' celebrations were concluded at Overstone, Northamptonshire, on Wednesday, where the Bishop of Peterborough consecrated large additions to the parish church and Bishop Thicknesse a new organ. The church has been almost entirely rebuilt by Lady Wautage as a memorial to her husband, the late Lord Wautage, V.C., her father, the late Lord Overstone, and her grandfather, Mr. Lewis Loyd.

The London County Council, by a Bill which has passed through the House of Lords, are seeking power to provide, near the sites of the various street markets used by costermongers, a series of shelters in which the trades can be plied, leaving the thoroughfares free for traffic.

On Woolwich Common on Saturday a red polished granite obelisk, erected to the memory of the officers, non-commissioned officers, and men of the 61st Battery Royal Field Artillery who fell in the South African War, was unveiled.

The bridge at Hay Mills, Birmingham, is about to be reconstructed at the joint cost of the Birmingham Corporation, the tramway company, and the Warwickshire County Council.

Trade News.

WAGES MOVEMENTS.

EMIGRANTS' INFORMATION.—The July Circulars just issued by the Emigrants' Information Office state that in Canada nearly all trades, especially the building, metal and engineering, and wood-working and furnishing trades have been well employed, and in some parts there is a dearth of skilled labour, but not in British Columbia. In Victoria the effects of the drought continue, and there is no demand for labour. The furniture trade is in a very depressed condition; it is largely in the hands of Chinese, and the demand for European workers is very limited. In South Australia there is practically no demand for more mechanics in the towns; but a skilled hand, such as a mason, bricklayer, engine-fitter, blacksmith, joiner, or carpenter, can generally find employment after looking about for a little. Throughout Western Australia there is little demand for mechanics, but competent men in the building trades (except masons) can get work at Perth, Northam, and elsewhere. There is no demand for them at Fremantle, Coolgardie, or Albany. Men in the timber mills have been busy. In New Zealand the building and engineering trades have been busy in nearly all the principal places. In Cape Colony there is a demand for masons, bricklayers, carpenters, and others in the building trades, if they are skilled. The cost of living is high. Carpenters at Pretoria have struck for a minimum standard of £6 16s. a week. The building trades in the Transvaal continue brisk, and good carpenters and bricklayers can obtain work; but there is no opening for inferior or unskilled men. Plasterers and stone-cutters (free stone) are in demand. There is a fair demand for first-class painters, but none whatever for rough painters; they must be thoroughly good men, capable of mixing their own paints, &c. In the Orange River Colony there is a fluctuating demand for good carpenters, masons, fitters, and painters, and men's wages have been recently raised to 2s. 6d. an hour.

SUNDERLAND.—Of the 350 Sunderland house joiners who went on strike on the 1st inst., 150 of them have already found employment at 10d. per hour, the majority in the town, and the remainder in places at a distance. The representatives of the shipyard joiners, who are demanding an extra two shillings per week, will meet the employers during the next few days to arrange for arbitration so far as they are concerned. The Northern Counties' Federation of Building Trades Employers met at Sunderland, on Tuesday, and decided to lock-out their joiners over the whole district, in support of the Sunderland employers, who are resisting an application for an advance of $\frac{1}{4}$ d. per hour.

Mr. E. C. G. Malet, Local Government Board inspector, conducted an inquiry at Scarborough town-hall, on Saturday, into the application of the Scarborough Corporation for sanction to borrow £3,500 in respect of the repaving of Westborough and Newborough, leading from the railway station to the market-hall, and the aquarium top between the Valley Park and the South Foreshore. The borough engineer (Mr. H. W. Smith) stated that the work of laying the electric tramways would commence on October 1, and the present application was to borrow money for laying wood-paving blocks in the streets to be broken up.

Beeston Hill Baptist Church, Leeds, was opened last Wednesday. The new chapel has cost £1,500.

The Middlesex County Council have voted £1,375 towards the acquisition of a strip of land fronting Highgate Woods, which is to be acquired at a cost of £5,500, and added to the Woods.

THE BUILDING NEWS

AND ENGINEERING JOURNAL.

VOL. LXXXV.—No. 2531.

FRIDAY, JULY 10, 1903.

"SUPERPOSED" HOUSES.

A QUESTION of some significance to lessees and others came before Mr. Justice Swinfen Eady the other day as to whether under a covenant that "net more than one house shall be erected on any lot," a breach of the covenant had not been committed by a defendant in putting up on one lot two houses which were separated horizontally and not vertically. We have reported the main facts of the case in our last issue, in which it is stated a judgment had been given on a motion by the plaintiffs, "The Ilford Park Estates, Ltd.," for an injunction to restrain the defendant, her servant, agents, or workmen from erecting on certain lots in Brisbane-road, Ilford, more than one house within the meaning of a covenant in a conveyance dated November 14, 1898, and made between the parties, or any house of less value than £300, or any building whereof the elevation had not been approved in writing by the plaintiffs' surveyor upon any one of the lots. The plaintiffs conveyed to the defendant certain hereditaments forming part of the Ilford Park Estate, having a frontage of 54ft. towards Brisbane-road, and shown on the plan as three lots, and the covenant by the defendant was to observe, perform, and abide by all the stipulations contained in the schedule, which provided that no trade, business, or manufacture should be carried on upon any lot except lots fronting Ley-street. Clause 5 provided no house shall be erected fronting any road of less value than stated in the schedule, the value to be calculated at net prime cost, exclusive of the land. Not more than one house shall be erected on any lot. The minimum value per house in Brisbane-road was to be £300 each house. Another clause provided that no building was to be erected on any part of the land save when the elevations had been submitted to and approved in writing by the plaintiffs' surveyor, and a copy of the design deposited with the surveyor. The defendant intended to erect several buildings, and submitted first an elevation and then an amended elevation of the proposed buildings to the plaintiffs' surveyor, which the latter refused to approve. No elevation had therefore been approved. The buildings were to consist of two floors. On the ground floor was one complete tenement, with its own front door. On the upper floor was another complete tenement, with a separate front door opening on a staircase, which was divided by a brick wall from the ground-floor tenement. The two front doors were side by side, set back in an archway. It was alleged by the plaintiffs' surveyor that these buildings which were being erected were a breach of the stipulation in clause 5 quoted above. This was the question before the Court. Mr. Justice Swinfen Eady, in giving judgment, said: "The contention on behalf of the plaintiffs was that the defendant was putting up on one lot two houses which were separated horizontally and not vertically. It was not disputed that if the defendant was erecting two semidetached houses vertically separated they would constitute two separate houses; but it was contended that the building was, in reality, only one house. There was no internal communication between the ground and first floor; there was no common staircase, as the ground floor did not require a staircase, and there was no common front door, but separate front doors for each of the two tenements. In order to pass from one house to the other it was necessary

to pass out of the front door of one tenement to a space which opened upon the street, and to enter the front door of the other. The language in which Lord Brampton, in 'Grant v. Langston,' described the building then in question was exactly appropriate to describe the building in the present case. He said: 'One roof covers the whole building, but each story is so structurally composed and arranged for permanent occupation by a separate occupier that there is no internal communication of any kind between the two stories, nor any common staircase or access to or from the street or from any part of the outside of the premises, each having a separate entrance or entrances therefrom. In short, it would be impossible to erect two separate houses under one roof or to divide one building into two distinct and separate houses more completely than has been accomplished in the building under consideration.' Now the question was whether each of these buildings constituted one or two houses. On the one hand, reference was made to the cases of blocks of flats. The first case was that of 'Kimber v. Admans' (1900), before Mr. Justice Cozens-Hardy and the Court of Appeal, where the defendant had erected blocks of flats on the plots purchased by him subject to similar restrictions to those in the present case. There it was contended that each flat in a block was a separate dwelling-house; but the Judge held that each block of flats constituted only one house. He said: 'That which it is proposed to erect seems to me to be a house of the value of more than £500, and none the less a house of that value because it is proposed to be used as a series of flats.' On the other hand, in 'Rogers v. Hosegood' (1900), there was no question here of one house being built and being intended to be used as two. In substance there were here two houses structurally separated in every respect with separate doorways into the street, and with no internal communication. It was different from the case where a building was erected and intended to be used for flats. In that case there was internal communication. Here there was none. It appeared to his lordship that there was here merely one house superposed upon another house and divided horizontally. It was stated that with certain modifications of the plans the building could be converted into flats"; but his lordship did not discuss this. In his opinion, "each building constituted two separate houses, and was a direct breach of the covenant." An injunction was granted. We have given the judgment *in extenso*, because of the argument involved, which is important when so many dwelling-houses are built on the principle of superposition, or with separate entrances from the outside, to all intent separate and distinct dwellings, though divided horizontally by a floor, instead of vertically by a party-wall. It is a cheap mode of building, of placing two houses on one lot under the same roof. It was possible to expend the amount scheduled on each of the houses; but this was not the main point, which was that the defendant had erected two houses where there should only be one according to the terms of the agreement. If two semi-detached houses were vertically separated, no one could dispute the fact of two houses; but because of being horizontally separated by a floor, the defendant contended it was only one house, and this mode of building seems to have suggested itself for economy's sake, or so as to get more houses on the lots taken. Where a building was erected as a block of flats the matter was understood. Mr. Justice Cozens-Hardy's ruling appears to conflict with the decision just given; but a little consideration will show that it does not. Each block of flats was said to be one house, but here there was an internal staircase, and the block was built in flats; but in the Ilford Estate case there was no internal communication, and the

contention was that it was only one house—there was nothing said about flats. Yet the question is a confusing one, and is likely to be raised again. There should be a clear distinction drawn between a house in one occupation and a house in more than one occupation, which can be inserted in leases; there should be a structural distinction also between houses divided vertically by walls and those divided by floors into separate flats; and these differences should be defined in Building Acts and by-laws. A house and a block of flats are not the same according to the ordinary way people refer to these structures—a distinct meaning is attached to a house as a building in one occupation, or used by one family, in which the mode of separation between it and other houses is by walls; whereas a "block of flats" is understood to mean what it really is—a series of separate tenements one over the other divided by floors. A structural distinction between the two kinds of building is that in a house for one occupation there is internal communication by means of a staircase between the floors; in a block composed of two separate dwellings there is not. But in a block of flats there is internal communication from flat to flat by means of a staircase, so that this distinctive peculiarity does not invariably distinguish the private house from the block of flats. Therefore it appears that the most desirable distinction for a house is that it is in one occupation. The division horizontally by floors has its structural disadvantages: there is a greater risk of fire and infection, and is therefore not desirable on large building estates, while the division by party walls or outer walls limits the risk to each occupation. Then there is the question of elevation. In a block of two flats or more the architect is restricted to a repetition of feature on each floor, and variety of elevation is sacrificed to the exigencies of plan. In the Ilford Estate case the defendant submitted an amended elevation which the plaintiffs' surveyor refused to accept, although it was stipulated in the conveyance that no building should be erected on any part of the land save where the elevations had been submitted to and approved in writing by the plaintiffs' surveyor. The submission and approval of elevations is a safeguard to the kind and class of building intended to be erected. In this particular instance an elevation would at once have disclosed the purpose of the building, and its being intended for two families instead of one; but, according to the report of the proceedings, no elevation had been approved. The decision will be useful if it prevents the erection of double or "superposed" houses on estates where private dwellings are intended, and it will strengthen the hands of surveyors and authorities in the exercise of their duties. We refer the reader to the full report given in our last issue.

THE LAW OF ANCIENT LIGHTS.

WE have at length a promise of amendment of the law relating to easements of light in the Ancient Lights Bill brought in and read a first time in the House of Commons on the 22nd ult. As our readers are aware, the Bill is the outcome of the labours of a joint committee of the Institute and the Surveyors' Institution. That committee was formed after the useful papers read before the Institute by Mr. Fletcher Moulton, K.C., M.P., Professor Beresford Pite, and Mr. Douglass Mathews, which we reported at the time. The members of the joint committee included Messrs. Edward A. Gruning, J. Douglass Mathews, J. Fletcher Moulton, K.C., the late Professor Roger Smith, appointed by the Institute, and Messrs. A. Rose Stanning, A. T. Steward, H. Chatfield Clarke, and G. Mallows Freeman, K.C., appointed by the Surveyors' Institution. The Bill, which comes with the joint approval of both

professional bodies, is divided into eight parts. We gave last week a brief notice of the provisions, and we may now more carefully examine the chief sections. In Part II, two definitions are worth notice. The definition of "tenement" is important, and is as follows:—"Tenement includes land, also any dwelling-house, workshop, or other building." "Street means and includes any highway, road, bridge, lane, mews, footway, square, court, alley, passage, whether a thoroughfare or not, and a part of any such highway, road, bridge, &c." "Occupier does not include a lodger." The most important section of the new Bill is the third, which deals with the "Limitation of the Amount of Light of a Dominant Owner," and runs as follows:—"From and after the commencement of this Act an owner of a dominant tenement shall, subject as herein provided, be entitled to such amount of light passing over the servient tenement as is reasonably necessary for the comfortable use and enjoyment of the dominant tenement of a dwelling-house, or for its beneficial use and occupation if used as a place of business or for any other purpose than a dwelling-house, and he shall not be entitled to any extraordinary amount of light necessary for any particular purpose, trade, or occupation." The object of this section is to prevent a dominant tenement owner setting up a claim for an extraordinary amount of light that may be necessary for any trade that requires minute, intricate handling, or the selection or comparing of colours, &c.—a very just and desirable provision that will put a stop to those unreasonable demands for light which check building progress in London and other large towns. Sub-section (2) clearly states that "nothing in this section shall confer on the owner of any dominant tenement any right to a greater amount of light than he would have possessed if this Act had not passed." But the next sub-clause (3) makes the exception in certain special cases; the section is not to "apply to a tenement in which a trade or occupation requiring an extraordinary amount of light has been continuously carried on for 10 years during the continuance of such trade or occupation." Two main classes of building or tenements are thus distinguished—one the ordinary dwelling-house or business premises in which no trade or occupation is carried on requiring any large amount of light, and the other tenements or workshops which have enjoyed for ten years an extraordinary amount of light for particular trades or professions. It will be, perhaps, not so easy in practice to draw the distinction; dominant owners who have enjoyed the light for the time named in ordinary tenements may contend that their rooms, or some of them, are occupied by trades which require ample light. They will, in fact, put themselves in the position of those who claim an extraordinary amount of light under sub-section (3). The next sub-section (4) states that this section only applies when the right of the dominant owner becomes absolute and indefeasible after the commencement of this Act. When, for instance, a dominant owner has not attained this absolute right, the section will not apply.

Part IV. deals with the important question of putting the law in operation. Section 4, in brief, provides that an owner of a tenement which is not servient to another till a certain time has elapsed may serve upon the occupier of the latter, and upon other interested persons, a notice, called an "Obstruction to Light Notice," which is to be in writing according to a given form contained in the first schedule of this Act, and accompanied by a plan and section or elevation, showing the windows the access of light to which is obstructed. This section will much simplify procedure, by preventing an owner of a tenement that may become dominant from making preparations to build. Sub-

section (3) states that on and after the day of service of this notice the access of light mentioned in the notice "shall be deemed to be obstructed as if the same were actually and physically obstructed,"—a provision which will supersede the need for unsightly boardings and obstructions before windows. Sub-section (4) says that any person aggrieved by such notice shall be entitled to the like relief so far as may be as he would have been entitled to if the access of light to the windows mentioned in the notice had been actually and physically obstructed by the person serving the notice; and an obstruction to light notice (5) shall, subject to any relief which may be granted before the expiration of one year from the day of service thereof by a Court of Jurisdiction, be deemed to be and shall have the like effect as an interruption within the meaning of section (3) of the Prescription Act, 1832, which has been acquiesced in for a year. It is also provided (6) that it shall be the duty of the vendor, on the sale of a tenement, to disclose any obstruction to light notice which might have been issued, and it shall be the duty of any person who receives any such notice in respect of a tenement he holds as lessee or occupier for a term of years to forward such notice to his next superior landlord.

These provisions, it will be seen, are intended mainly to supersede the present light conditions, by preventing the accruing of right of light by lapse of time. The obstruction to light notice will be in effect the same as an interruption under the Prescription Act. According to the present law the accruing of the right to light can be prevented by the owner of the servient tenement obstructing the dominant tenement owner's windows before the light has been enjoyed by him for twenty years; but by the proposed Act, the owner of the tenement not yet servient will be able to accomplish the same end by less objectionable and easier means.

By Part V. section 5, no title shall be acquired by prescription under the Prescription Act 1832, or at Common Law, by the owner of any building which shall have been erected after 31st of December, 1890, and which abuts on any street, to a right to light passing over a tenement on the opposite side of the street. This is a reasonable section, and provides that all buildings erected after that date are not in a position to acquire a right to light over opposite buildings, and therefore the owner of any opposite building will be free to raise his premises to any convenient height he pleases. The effect of this law will be to encourage a development of building in streets, and to reduce the number of servient tenements.

Part VI. deals with the provisions for certificated plans of buildings about to be taken down. The clauses are important to the profession. Section 6 (1) enacts that the owner of a building about to be taken down and rebuilt may cause plans, sections, and elevations to be prepared, and may apply to the official surveyor to survey the building and certify the correctness of such plans, &c. Every application to the said surveyor is to be accompanied by a fee according to a table given on the schedule for such inspection and certificate. The official surveyor (3) shall either grant a certificate that in his opinion the plans, section, and elevation are correct, or may refuse to do so, in which case he is to state the grounds of refusal; if the surveyor refuses to grant a certificate (4), the applicant may cause fresh drawings to be prepared, and may make a further application to inspect and survey the building; if the surveyor still refuses, the applicant may at any time within fourteen days make application to the tribunal of appeal, by way of appeal against such refusal, accompanied by a copy of the surveyor's refusal (6). A certificate (7) granted under this Act will be conclusive evidence

of the correctness of such plans, &c., in any actions relating to the right of the owner of such building to light. The official surveyor means, in the case of a building in the County of London, the district surveyor, and if in any other county, not within a borough, the county surveyor, and if in a borough the borough surveyor. A register of such drawings is to be kept by the official surveyor, and the drawings are to be deposited at the county hall, and be open to public inspection, on payment of a fee (subsections 8 and 9). One of the advantages to be derived from these provisions is that all disagreement about the building to be taken down and rebuilt, as to the positions and sizes of the windows, will be avoided, and the certified drawings will be open to the inspection of all parties interested in the right of light. No less important is the power given to the official surveyor, whoever he is, to investigate and examine the premises to be rebuilt, and to certify, or refuse to certify, the correctness or otherwise of the drawings prepared—a provision which will put a stop to all precipitate building disputes and unnecessary legal proceedings, which are now so often costly, and are begun for the purposes of "blackmail." By the next section, 7: (1) a servient owner who intends to erect a new building, or alter an existing one, can be required by the dominant owner to give him, or any person appointed on his behalf, facilities to inspect the plans, sections, and elevations of the intended new building or alteration; or if there be no such plans, &c., give such information relating to the intended building as the dominant owner may require. A great "bone" of contention will by this clause be removed. At the present time servient tenement owners who propose building or altering their premises proceed without giving their neighbours any information until they are taken to book. They often do not give them any opportunity of seeing the plans and of making any objection. By this section the dominant owner will be entitled to see the drawings, and, if possible, to come to conciliatory terms with the building owner before the latter begins to build; and in this manner friction and lawyers or surveyors' fees will be saved. Sub-section (2) states that the dominant owner may within seven days after inspecting the plans or receiving information, serve upon the servient owner notice in writing of his objections or the terms on which he is willing to permit the servient owner to erect his building. The notice is to be in writing, and sent by registered post, or served personally. The notice (3) may also contain name and address of surveyor, who will act on dominant owner's part in case of any difference arising. The servient owner within seven days may, after service of notice, serve the dominant owner with notice in writing that he accepts the terms, and an agreement be come to; if, on the contrary, the servient owner is not willing to accept terms, he shall within seven days of the notice serve notice in writing that he refuses the terms, and shall state the name of surveyor who will act on his behalf (4 and 5). Section 8 (a) provides that if the servient owner does not accept terms, the two surveyors appointed within ten days of the appointment of the last of them, meet and try to determine the question in dispute, and shall (b) appoint an umpire, a member of the R.I.B.A. or of the Surveyors' Institution, and (c) the umpire is to view the site and the dominant and servient tenements, and make his award within 21 days after the original time appointed by the Act. Section 9 details the matters the arbitrators or their umpire may decide: these include the right of building owner to build; the alteration, if any, necessary to be made in the building, so as to prevent or lessen obstruction to light of the tenements as set out in notice of objection; the amount of compensation, if any, to be

made to the owner or occupier; alterations, if any, to the adjoining premises by light-reflecting surfaces, enlargement of lights, heightening of premises, &c., amount of costs. Sections 10, 11, and 12 relate to neglect of appointment of surveyor within the prescribed time or the unwillingness of the umpire to act; in such case either party may apply to the President of the R.I.B.A. or the President of the Surveyors' Institution, who will appoint an umpire; the appeal that may be made from surveyors by either party to the tribunal of appeal; reference of dispute to High Court, and other formalities of such action. These sections will greatly facilitate the settlement between the parties. The appellant to the tribunal, if he refuses to accept the decision, can bring an action in the High Court; but the Act enables both parties to come to amicable terms by arbitration before resorting to law. Part VIII., section 15, deals with the constitution of the tribunal of appeal. It is to consist of three barristers-at-law appointed by the Secretary of State, three members appointed by the council of the R.I.B.A., and three members by the council of the Surveyors' Institution. A member to be appointed for a term of one year, and at the expiration of his term of office shall be eligible for reappointment. The other sections relate to removal of members, remuneration, jurisdiction, and regulations as to procedure. The tribunal have power to hear the parties either in person or by counsel; also to determine to what extent proposed new buildings may be amended or the dominant premises altered. Section 27 provides that in any action by a dominant owner against a servient owner in which an injunction is claimed, notwithstanding that an injunction by an interlocutory order have been already granted upon the application of the servient owner, either party may apply to a judge of the High Court, either to hear such action with assessors, or to refer the matter to arbitration according to the provisions. The judge, on hearing the application, may consider the claim may be satisfied by damages, and on his own motion refer the case to arbitration, and if on such hearing he shall be of opinion that the action for an injunction has been unreasonably commenced, he may order the party bringing the action to pay the costs of the defendant on such scale as he may think fit. This useful clause is intended to prevent any dominant owner from bringing any unnecessary action for an injunction against the servient owner, and to enable either party to obtain redress. The vindication of the right, according to the present law, is often troublesome in the extreme where a right is in danger of being infringed. A person may obtain redress by means of an injunction. Often the slowness of the cause is apparent, and the Court may give only nominal damages and refuse an injunction. The damage often sustained by a dominant tenement owner may be small, and compensated by a small money payment. Then a mandatory injunction is a more vindictive means resorted to—an order to compel the defendant or building owner to pull down and restore the building which obstructs the light to its previous condition. This kind of injunction is reluctantly granted by the Court. Then an interlocutory injunction has been granted both in Common Law and the Chancery Divisions pending the decision of an action, the object of which is to prevent the erection or enlargement of a building, or the pulling down of a building. The legal remedies for redress where rights of light infringed or threatened by an action for damages or by an injunction to restrain, in practice are involved and difficult. The new Bill will take into account threatened injuries which are now not dealt with: a money payment will be substituted for any injunction to restrain, so that develop-

ment of building in our towns will not be wholly stopped, and equitable terms of settlement arranged. The law as amended will help much to simplify legal procedure. The tabulation or registration of buildings which are about to be rebuilt or altered will simplify matters. Correctly measured and certified plans and elevations will be made and inspection rendered easy by all parties interested on payment of a small fee. The building owner, above all, will have to make his intention known before he begins building, or even preparing plans, and thus a great loss of time which now takes place will be saved, besides costly alterations to plans and buildings. By the employment of an architect and surveyor by the dominant and servient owner, the question of infringement will be dispassionately discussed, and many disagreements arising chiefly from misunderstandings or feeling in the matter will be avoided. There may be a few alterations and amendments necessary in the Bill, but as it stands it embodies in principle the resolutions formulated many years ago, chiefly based on proposals which the late Professor Roger Smith, the late Mr. Arthur Cates, and Mr. Douglass Mathews had laid before the Science Committee as long ago as 1881. It is singular indeed to find many of the advantages and points which the Bill embodies were foreshadowed during the earlier discussions of the question, and are the results of the practical experience of professional men. The hard-and-fast dicta of the Law Courts have been taken, instead of a reasonable treatment in which an equivalent value or damages is given to the party aggrieved. A practical rule of estimating damage is necessary if we are to have any real improvement, by which every obstruction may be estimated at its true value. Decisions have been exceedingly obscure and difficult of comprehension; the judge sometimes has refused to give damages, but restrained the building owner by granting an injunction. By awarding damages in all cases of infringement, a reasonable course would be followed. In the case of buildings advanced, damages estimated in view of actual interference of the light is a fair mode of dealing with the offending party, but even such damages will be small if the law as amended becomes operative.

INTERNATIONAL FIRE PREVENTION CONGRESS.

DURING the present week an International Congress on Fire Prevention has been held in connection with the Fire Exhibition at Earl's Court. Some eight hundred members, English and foreign, have been accredited to the congress, including official delegates from fifteen Governments, and representatives of various British Governmental departments, local authorities, public institutions and societies, and the meetings, which, with the exception of the opening one, have held at the Caxton Hall, Westminster, have been well attended and characterised by much interest.

The inauguration of the Congress was performed by the Lord Mayor and Sheriffs at the Empress Theatre, Earl's Court. The delegates were welcomed by the Lord Mayor and Lord Windsor, First Commissioner of Works. Mr. Edwin O. Sachs, chairman of the British Fire Prevention Committee, delivered an opening address, in which he foreshadowed various reforms needed in the near future. In connection with the question of standardising tests would come the banishment of those fraudulent traders who, under the title of "fireproof," tried to palm off on unwary architects, builders, and landlords spurious materials and unsafe systems of construction. The conference ought to take the first steps towards making it illegal to sell unsafe materials under the name of "fireproof." The word, which was a misnomer, ought to be excluded from the vocabulary of the English and American nations; it was the committee's intention always to substitute the word "fire-resisting." Municipal authorities should be made to recognise that building regulations must be supplemented by

regular fire surveys or fire patrols, with the view of obtaining preventive measures in the equipment and use of buildings. The conference might do well to draw the attention of those concerned to the necessity of extending the existing forms of special regulations for theatres or factories to other classes of buildings, especially to boarding schools. The great insurance companies were to be congratulated on having at length published their requirements as to specific classes of risks in buildings; but these needed to be extended and classified for the guidance of intending building owners and their advisers.

Sir Louis Lépine, Prefect of Police, Paris, formally presented four medals from the President of the French Republic to Mr. Sachs, Lieutenant-Colonel Fox, Mr. H. S. Folkes (secretary of the National Fire Brigades Union), and Mr. Brasier (chairman of the London Private Fire Brigades Association) for their services in connection with fire brigade work.

The various sections—six in all—met at the Caxton Hall, Westminster, on Tuesday, Wednesday, and yesterday (Thursday), for the reading and discussion of papers. Section I., over which Mr. A. Darbyshire, F.S.A., V.P.R.I.B.A., presided, was devoted to "Building Construction and Equipment"; Section II., Sir W. M. Preece, K.C.B., F.R.S., chairman, dealt with "Electrical Safeguards and Fire Alarms"; and Section III., with Captain Thomson in the chair, had as its subjects "Storage of Oils and Spontaneous Combustion"; and the others were Section IV., "Fire Survey and Patrols," Prince Alexander L'voff, chairman, and Mr. Guy Pym, M.P., as acting vice-chairman; Section V., "Fire Losses and Insurance," Sir J. J. Runtz presiding; and Section VI., "Fire Tests and Standardisation," with Mr. E. O. Sachs in the chair.

Amongst the papers read in Section I. on Tuesday was one by Mr. Max Clarke, A.R.I.B.A., on "How to make Existing London Buildings More Fire-Resisting." The author referred to the importance of careful selection of constructional details and materials in view of the inherent danger there always was in large cities in the proximity of one building to another. Matchboarding was used in places where it could very well be done without as regards the construction, and it was a material the use of which on walls and ceilings, so far as safety in case of fire went, was much to be deprecated, as the fire passing along it at a high speed often rendered escape from a building impossible. He urged that matchboarding should not be permitted to be used in new buildings, and that after a certain date it should be removed from all old buildings. The naked joists in ceilings could easily be protected and ceilings made fire-resisting by covering them with wire netting or some form of expanded metal and plaster. The most important point in buildings of the warehouse class was the means adopted at present for the prevention of the spread of fire in lift wells. Great improvements could be made in this matter if all lift shafts were properly inclosed in some form of non-combustible material. There were also defects in fireplaces and flues which could be remedied.

Mr. Ellis Marsland, M.S.A., district surveyor for Cumberwell and hon. secretary of the Congress, read on Wednesday a short paper on "The Planning and Arrangement of Large Retail Commercial Establishments." He pointed out that in dealing with this question there are at least four points to be taken into consideration: Firstly, the interests of the proprietor; secondly, the safety and convenience of the customer; thirdly, the local building regulations; and fourthly, the claims of the fire department. The proprietor's demands are plenty of window space, plenty of floor and wall space upon which he may erect his counters and fittings, and plenty of light, preferably from the north. The customer requires ample staircase and elevator accommodation, plenty of gangway space, and easy exit and egress. The building regulations may require a limited amount of cubical space; therefore the building, if a large one, will have to be divided into compartments, and these shut off from one another by fire-resisting doors. The fire department claims that any outbreak of fire may be quickly localised, the occupants passed to a place of safety, and that short work be made of any outbreak by reason of its being attacked from more than one point. Also that adjoining premises be not unduly endangered. This is the problem set the architect in planning and designing a building of

this character. In order to give practical value to his observations, the lecturer dealt with a typical case on a site of 70ft. by 200ft., fronting to two streets, the cubic capacity being restricted to 250,000c.ft., as in the London regulations. On such a given site he would place a building four stories in height, which would mean some 55ft. from the ground floor to the level of the top of the topmost story. The cubical contents of such a building would require that it be divided up into three compartments. In solving the problem he adopted what may be termed the well-and-compartment system. The proprietor had ample floor and wall space, and the light is provided by means of large glazed lanterns from the roof, throwing a flood of light down the well on the several floors, in addition to any side lighting that might be available. The customers have six staircases running from ground floor to roof, with an elevator provided to each. The door openings in the compartment walls are opposite one another and in direct line with the exits into either street. It is necessary that all the floors and supports be of fire-resisting construction, and all iron and steel work protected by concrete or hollow tile casing. There being nothing but the contents to burn, the task of the fire department would be a simple one. A fire on any floor could be attacked from above and below. The openings in the party walls would be a means of getting readily at the seat of the fire, and at the same time affording a chance of escape in an emergency. The well and lantern would form a shaft for the escape of smoke, and the flat roof would afford access to this from the several staircases. The fire-resisting doors in the openings could with facility be closed, and the fire confined to one compartment. The unpacking, packing, or store department, if situated in the basement, should not communicate with the upper part, except by lift, placed outside the building, inclosed with walls carried up through the roof and covered with a light roof of iron and glass, and the openings on each floor protected with fire-resisting doors. The offices and counting-houses should be in an adjoining annexe, and the dining and sleeping accommodation for the staff placed over and in this annexe, with separate exit and staircase and fire-resisting floors.

Mr. Bernard Dicksee, A.R.I.B.A., district surveyor for Newington and Southwark, followed with a paper on the "Fire-Preventive Sections of the London Building Act," in which he dealt in detail with the provisions of the five measures under which the construction of buildings in the Metropolis is controlled, and epitomised the leading decisions in regard to fire-prevention governing their interpretation in actual practice. The lecturer then proceeded to deal with some very important omissions from the London Building Act, which urgently demanded further legislation. The chief of these was the question of the proper protection of iron and steel from the action of fire. The London County Council have the power, hitherto not exercised, to make by-laws on this subject; but it should be dealt with not by by-law, but by a section in an Act requiring the protection of all columns, stanchions, brusses, and joists. Another neglected subject was the internal construction of warehouse buildings, in which at present inflammable materials could be used. Matchboard lining, especially in warehouses, should be severely regulated, and so should also lath-and-plaster partitions, the use of which, indeed, should be discouraged as far as possible. Other omissions from the present Act were lift shafts and steel-framed buildings. He regretted that the licensing of wooden structures had been transferred by the London Government Act of 1899 from the County Council to the borough councils. The question of exit in case of fire was almost ignored until the passing of the Building Act of 1891, and was therein very imperfectly dealt with. The proviso in section 68 of that Act, that buildings exceeding 60ft. in height should be provided with such means of escape "as can reasonably be required," was most unsatisfactory, as it gave arbitrary power to an official or a committee. The exemption sections of the Building Act needed careful revision, and such exemptions should be reduced to a minimum. Mr. Dicksee argued that the scope of the Act should be extended, so as to make its provisions applicable to existing buildings, but that the power of interference by authorities with such structures should be exercised only once, and the controlling body should, he held, be the London County Council.

Among the papers read in Section III. was one

DOORWAY TO 19, QUEEN ANNE'S GATE, S.W., THE OFFICE OF MR. ASTON WEBB, R.A., P.R.I.B.A.

by Professor Ira Woolson, of Columbia University, New York, on "Fireproofed Wood as a Building Material." The author urged that all permanent construction should be strictly incombustible, and no system of building should be recognised as fire-resisting unless proved to be such by practical test, such as those carried out by the British Fire Prevention Committee in London and in the United States by the New York City authorities, also by the National Board of Underwriters at their testing laboratory in Chicago, and by the Insurance Engineering Experiment Station in Boston, Mass. The term "fireproof wood" is a misnomer for all such woods that burn if exposed for a sufficient time to a high degree of heat. Strictly speaking, the processes of treatment did not make the woods fireproof, but simply rendered them fire-retardants. Fire-resistant wood was a much more logical term. The author had, under the direction of the Bureau of Buildings, to test most of the wood which has been used in lofty buildings in New York. For the year ending the first of this month he had tested and reported upon upwards of 3,500,000ft. The greatest part of this material was for floors, which were laid on the top of strictly fireproof floor construction of the concrete or hollow tile. The balance of the material was used for trim. Most of the tests employed were more or less unsatisfactory, the one which he favoured being a method designed by himself and known as the "timber" test. The specimens for this test were accurately cut to a size of 1½in. by ½in. by 12in. These "timbers"

were tested in pairs by being laid across the top of a gas crucible furnace, in which a constant temperature of 926° Cent. = 1,700° Fahr. was maintained. This particular temperature had been chosen because it was given by the New York Building Code as approximately the heat of a burning building. At the end of two minutes the specimens were removed, and duration (1) flame and (2) glow noted for each. The temperature was under constant control by means of a Le Chatelier pyrometer. The proportions of gas and air were regulated to furnish a vigorous flame 8in. to 10in. above the furnace, so imitating an ordinary fire. After test the specimens were sawn in two at the middle and tracings made of the unburned wood. These tracings were then measured by planimeter, and the percentage ratios to the original cross-section calculated. The percentage of unburned wood was printed upon the tracing of each specimen, and then blue-prints were made which became a part of the permanent record. These tests showed that the tendency of untreated woods to burn was from ten to twenty times that of treated woods, the two chief defects of treatment being that it weakened the wood, and rendered it more brittle, and that it tended to make the wood absorbent of moisture.

A series of tests were carried out at the British Fire Prevention Committee's station in Porchester-terrace on Wednesday and Thursday afternoons. Those on the former day dealt with doors and partitions, while yesterday floors of Karri and other hardwoods were experimented upon.

HOOD TO DOORWAY AT EXETER.

Mr. F. R. Farrow, F.R.I.B.A., asks us to announce that he has resigned the chairmanship of the Commercial Section and membership of the Executive of the British Fire Prevention Committee, and also the title of Hon. Publications Secretary of the International Fire Prevention Congress.

OLD ENGLISH DOORWAYS.*

MR. W. GALSWORTHY DAVIE has photographed a capital series of porches and entrances from historical English buildings, and

in book form by Mr. B. T. Batsford, giving seventy full-page photographic plates, besides the sketches and marginal notes with which the introductory essay is enhanced, making a most admirable addition to any library of architectural and artistic books. The subjects thus brought together comprise many of the best types of doorways to be seen in England. Among these we note some by no means well known, such as the early example of a shaped, headed, framed opening from Looe-street, Plymouth, with moulded jambs and stopped ends, a highly suggestive and pretty piece of simple design, having

DOORWAY HOOD AND BRACKETS AT RYE, SUSSEX.

Mr. Henry Tanner, jun., has compiled some useful and suggestive descriptive notes of the examples chosen, which range from the days of the Tudors to the end of the 18th century. The result of this combined undertaking is produced

mouldings dividing the face of the door into compartments rather than framed panels, essentially Gothic in idea. The projecting porches of the Middlehouse, Mayfield, and the Butchers' Guildhall, Hereford, are more familiar and interesting, though the ornamental parts of the latter on the posts and brackets should not be imitated. The garden-wall doorway from Payne's

Alms-house, Oundle, like the central porch of the Weekly Hospital, Northamptonshire, has a shaped gable as its surmounting feature, said by Mr. Tanner to show foreign influence, which, however, remains a matter of opinion. They both appear to us to indicate rather the spirit of Sir Thomas Fresham's design. Great Wigsell, Sussex, has a good sample of the style, of which the Sackville College at East Grinstead is a model in the same county, while the Gate House, Kenilworth, has a more monumental entrance flanked by niches in the same type of Renaissance earlier in date than the last named, having detail very like some at Knoke, which was erected in 1605. Anyway, these early specimens, as at Cobham and Hatfield, form contrasts by their richness to the plainer work in which they are so happily set, giving a practical suggestion of more value to the architect than an exact knowledge of their chronological order of building. The Manorhouse at Upper Ewell, Gloucester, with a largely treated arched pediment inclosing a cartouche, strikes us as an unusual and handsome piece of work, though the impostes are coarse and plain. From "Bateman's," Burwash, Sussex, a small door reminds the reader of Mr. Ernest George's Jacobean freedom of design, with an association, perhaps, of Belgian or Dutch fancy. The Deanery, Battle, Sussex, the churchyard gate at Ross, Herefordshire (leading from "The Prospect," and dated 1700), and the doorway of the Vicarage, Hailsham, Sussex, commence a series of Classic portico designs chiefly from Kent and the home counties. Of shell-canopied doorways there are several good instances illustrated—some in stone and plaster and some in wood—from Burford, Oxon, Ledbury, Herefordshire, Bristol, High Wycombe, and including the famous one originally at Fairfax House, Putney, but now at Hampstead. The two canopied hoods from Grosvenor-road, Piccadilly, and the Manor House, Bermondsey, are particularly rich and interesting; while that from "Brickwall," Northam, Sussex, has been imitated in modern houses several times already with more or less success. The remaining plates are devoted to later types of work. We need hardly point out how very important a feature the doorway of every building necessarily is—how it makes or mars a façade—while no feature repays the designer more fully for study and refinement of detail. Everyone must see the entrance to all buildings visited, and it furnishes the keynote of the whole composition, no matter how plain the rest of the work may be. A collection like this, though it is by no means, of course, exhaustive, or even complete, cannot fail to be useful. It makes a nice volume for a present, and, without being overweighted with descriptive matter, is more than a mere collection of photographs casually got together. The red linen cover appropriately completes the book, which does the publisher every credit.

CHIPS.

The Queen Victoria Memorial Almshouses have been opened at Newport, Mon., by the mayor. Accommodation is provided for nine inmates, and in addition a slender income of £24 per annum for each of these is supplied by an endowment. The houses, which are situated on Stow-hill, stand on three sides of a square, inclosing a grass lawn; they are one-story buildings, floored throughout with wooden blocks, and lighted by electricity.

The Borough Council of Hampstead have agreed to the erection of a block of workmen's dwellings in Upper Park-road. The new dwellings are estimated to cost £13,004, and will contain 123 rooms, divided into twelve tenements of two rooms each, twenty-four of three rooms, and eight of four rooms.

The Cornwall Laundry Co.'s undertaking at Pengegon, near Camborne, was formally opened last week. The builder was Mr. John Barbary, of Dolcouth-road, Camborne.

At the last sitting of Glasgow Dean of Guild Court linings to the total value of £87,588 were granted. The University Court received authority to erect workshops, stores, offices, and inclosure walls in Erdington-street, Oran-street, and Sawmillfield-street; and Sir Wm. Arrol and Co., Ltd., to erect a pattern-shop and drawing office in Preston-street.

The Treasury have agreed to make a further free grant of £5,000 in aid of the Pwllheli Harbour scheme, in addition to the £17,500 which has already been secured. The harbour works will now be proceeded with without delay, and the inauguration of a scheme costing, roughly, £60,000 cannot fail to materially advance the prospects of the town.

* Old English Doorways. By W. GALSWORTHY DAVIE and H. TANNER, Jun. London: B. T. Batsford. 15s. net. Cloth, gilt top.

OBITUARY.

ALDERMAN THOMAS BARNABAS LOWE, of Burton-on-Trent, the head of the well-known firm of Messrs. Lowe and Sons, builders and contractors, died on Tuesday. He was in the sixty-third year of his age. Mr. Lowe's public work began with the incorporation of the town in 1878, when he was elected a member of the first town council. At the inaugural meeting he was chosen one of the aldermen, and in 1884, and again in 1885, was elected mayor. He was placed on the commission of the peace for the borough, and also for Staffordshire and Derbyshire. By his connection with the corporation he was closely associated with the principal works of public improvement in the borough, and he served with distinction on the gas and the highways committees. He sat for twelve years on the school board, and during a portion of the time was the vice-chairman. He was deeply interested in the Burton infirmary, of whose committee he was for many years chairman, and he afterwards accepted the honorary secretaryship. Although he was president of the Burton Master Builders' Association, he was in full sympathy with labour, and in bringing employers and employed together he averted many a strike and removed much bitterness. His firm have carried out most important works in various parts of the kingdom, and notably in Birmingham.

ON BUILDING TIMBERS.—XXX.

YELLOW PINE (*PINUS STROBUS*), WHITE SPRUCE (*PICEA ALBA*).

THE price of yellow pine varies more, for the same size and branded quality, than any other wood commonly used in building, first quality "bright," 3in. by 11in., bringing from £17 10s. up to £32 10s. per Petersburg standard, or from 2s. 1½d. to nearly 4s. per cube foot. It need scarcely be said that at the latter price this wood seldom or never finds its way into builders' joinery, or even into furniture, judging by specimens of the latter so frequently seen outside "easy instalment" shops where mahogany is fourth quality stained yellow pine, and solid walnut spruce of the vilest kind smeared over with a wash of dirty brown ochre. Handsome suites of "solid" American ash or walnut are built up with three or four different kinds of wood, which may be described as the offal of the market, and this showy rubbish, pitched together without a decent joint in it, or in many cases the saw kerfs being taken out of the wood, finds a ready sale amongst City clerks and others, who fail to see that the stuff is not good enough for a decent piggyery, much less a human dwelling. Some few years ago the writer superintended the cutting of a quantity of timber in a mill at the East-end of London, in a locality celebrated for its shoddy furniture "industry." From time to time one of the smaller saws was requisitioned for the use of regular customers, who came with short pieces of tree trunks and branches which they selected from a quantity thrown together in an adjoining yard. The sawdust from these pieces appeared to be very damp. On squeezing it between both hands water ran out as if from a sponge, yet within three days this wood was converted into the centre pillar of a solid walnut table which cost the shopkeeper 15s., polished complete. To make the wood at all workable, the outside was rapidly dried before a fire which the operative kept up in his bedroom all night, and every scrap of waste wood, even to that knocked out of packing-cases, was used up in the manufacture of drawing-room and bedroom suites! The panels of doors, window-backs, soffits, linings, and all framed work where painted should be of yellow pine, for they can be obtained in one width, and glued joints, so common in Swedish doors, are completely avoided; but care should be taken that in nailing mouldings round panels none of the nails enter the panels, or the latter will be certain to split in shrinking if the wood is not kiln-dry. Nothing is more common in old work than split panels, and this failure invariably occurs from nailing the moulding through the panel whilst the moulding itself is also nailed to the stiles and rails of the door; in fact, all panels should be free to move in the grooves which hold them in their places, and in good work it is just as important that they be selected absolutely free from knots. Where wide panels of yellow pine are necessary, it is advisable to cut them on the

quarter, or radially, for they have a tendency to buckle slightly in the centre where not stayed by the framing. Work would, no doubt, stand better with narrow panels than with wide ones: that is, the faces would remain more nearly plane surfaces as they leave the bench. When a panel exceeds 7in. in width, and it is cut tangentially, the centre will be found after 10 or 15 years to be more or less a winding. If there are knots they will be split, and their surfaces will be out of line with the panel faces. It has always been a recognised custom in the trade to cut oak for joinery with its greatest dimension (width or thickness) in line from the centre of the tree to its circumference; it is of importance that the same method of conversion be adopted in dealing with yellow and other pines if it is necessary to produce work which will stand well. Ordinary qualities of yellow pine from Montreal, Port Leamington, Gander Bay, Lewisport, Botwoodville, Ottawa, and Quebec sell for the following prices:—First, 3in. by 11in., £21 15s.; 3in. by 10in., £17 10s. to £19 5s.; 3in. by 9in., £19 5s.; 3in. by 8in., £18 5s.; 3in. by 7in., £10 5s.; 3in. by 4in. to 6in., £12 5s.; 3in. by 4in. and 5in., £10. Second, 3in. by 12in. to 15in., £14 10s.; dry, "bright," 3in. by 11in., £15 10s. to £19 5s.; ordinary, 3in. by 12in. to 15in., £14 10s.; 3in. by 11in., £14 5s.; 3in. by 10in., £11 5s.; 3in. by 9in., £11 15s.; 3in. by 8in., £10 5s.; 3in. by 7in., £10; 3in. by 6in., £10 15s.; 3in. by 4in. and 5in., £10. Third, dry, bright, 3in. by 14in. to 20in., £8 5in.; 3in. by 13in., £8 5s.; 3in. by 10in., 12in., and 13in., £10 15s.; 3in. by 12in., £8 15s.; 2in. by 5in., £6 15s.; Third selected, 3in. by 11in., £13 10s.; 3in. by 7in., £10 10s.; 3in. by 3in. and 4in., £4 15s. Fourth, bright, under cover, 3in. by 9in., £10 5s.; 3in. by 8in., £9 15s.; ordinary, 3in. by 12in. to 18in., £7 5s.; 3in. by 13in., £6 5s.; 3in. by 11in., £6 5s. to £8 15s.; 3in. by 10in., £6 to £8 15s.; 3in. by 9in. to 17in., £6 to £7 10s.; 3in. by 8in., £7; 3in. by 7in., £7 5s.; 3in. by 6in., £6 15s.; 2in. by 9in. to 14in., £6 10s.; 2in. by 7in. to 8in., £6 10s.; 2in. by 4in. to 6in., £5 5s. The relative values of Red Pine (*P. Resinosa*) and Yellow Pine (*P. Strobus*) may be taken from the following prices:—First red, £18, first yellow, £21 15s., both being 3in. by 11in., and of the same class of goods in every way. Hitherto the logs of yellow pine imported here have always been hewn; but quite recently some logs sent to Liverpool are sawn. The timber in both logs is, of course, the same. In future sawn yellow pine logs will be as common in the market as sawn pitch-pine are in proportion to hewn logs.

Canadian white spruce is imported from Quebec, St. John's, Dalhousie, Greenstone Island, Pentecost, &c. It and the black spruce (*Picea Nigra*), from which it is not distinguished in commerce, are characteristic trees of the Northern Forest Belt, which stretches along the north shore of Labrador to the 60° of North Latitude sweeping along the south of Hudson Bay and then north-westward into the Arctic Circle. The southern boundary of this forest reaches the 50° of latitude on the Atlantic Coast, and the 54° at the 100th meridian of longitude. It occupies 10° of latitude on the Atlantic seaboard, and extends for 20° north and south along the eastern side of the Rocky Mountains. To have clear ideas as to the districts in which American building timbers are grown, it is necessary to be acquainted with their general divisions, as agreed to by practical foresters there. All the North American forests are classified as belonging either to the Atlantic or Pacific Regions, the Rocky Mountains separating one from the other; the climate and meteorological influences to which trees are subjected being so different to the east and west of the range, that characteristic trees distinguish each region, which is again subdivided into "belts" or "forests" where certain trees only attain their greatest development under favourable circumstances. The Atlantic Region is made up of five distinct forest belts, which stretch across the continent from the Atlantic to the Rocky Mountains, the boundaries between them having a general trend almost due east and west. (1) The most Northern Forest Belt is that in which the white and black spruces are the characteristic trees. (2) The next great division is the "Northern Pine Belt" with black spruce to the north and Yellow Pine (*P. Strobus*) as the characteristic timber tree distributed over the entire area. (3) The "Southern Maritime Pine Belt" lies chiefly towards the Atlantic seaboard, and it is distinguished for its Cypress (*Taxodium Dis-*

tichum) and Pitch Pine (*P. Palustris*). (4) The Deciduous forest of the Mississippi and Atlantic plain is remarkable for its oak, hickory, magnolia, and ash, with the Pitch Pines (*P. Palustris* and *P. Mitis*), which attain their greatest development here. Red Cedar (*Juniperus Virginiana*) is also a characteristic tree of this division, and it should not be confounded with another red cedar, the wood of *Thuja Gigantea*. (5) The last forest division in this region is the sub-tropical forest of Florida and South Texas, the principal tree in which is the Mesquit (*Prosopis Juliflora*). It yields a hardwood used extensively for beams and underpinning, and has the reputation of being almost indestructible in contact with fire. The Pacific region is divided into two forests, the "Northern" and the "Coast," White Spruce being the characteristic tree in the former. The characteristic trees of the latter vary with the latitude; between 50° and 61° the trees which grow best are the Alaska Cedar (*Chamaecyparis Nutkaensis*), the Tideland Spruce (*Picea Sitchensis*), and the Hemlock (*Tsuga Mertensiana*), the "Oregon Pine" (*Pseudotsuga Douglasii*), and the Red Cedar (*Thuja Gigantea*) are also well developed here. As the Coast Forest ranges south other trees take the places of those already enumerated, another "Yellow Pine" (*P. Ponderosa*) appearing, and farther south still the Sequoia "Red Wood" trees are found. The Northern Forest Belt in which the spruces are found is subject to a copious rainfall, the country is divided by innumerable streams and lakes, and there are swamps of great extent, the low mean temperature checks growth, and along the northern boundary of this entire region the forest is scattered and stunted, the trees being of no commercial value whatever. No other arborescent trees are found growing with the spruce in high latitudes. Farther south in this northern forest the spruces are found growing in low wet soil near swamps and lakes, and they are, undoubtedly, the most important trees in the American sub-Arctic forests. In favourable situations they attain a height of close on 150ft., with a diameter of 3ft., but they are usually not more than 50ft. in height, with a diameter of about 18in., the black spruce (*Picea Nigra*) an associated variety, is a smaller tree; both are cut together for "lumber." It is by no means an easy matter to distinguish the sapwood in these spruces, as it dries like heartwood; the fine small knots will sometimes knock a gap in a highly-tempered plane-iron quite as efficiently as a cut brad, they are so hard. Yet the wood itself, though close and straight-grained, is not strong; finished with a well-sharpened smoothing plane, the surface is satiny, and there is a marked absence of resin ducts which are so numerous in other conifers. The wood is light, a cube foot weighing only 25½lb. There are two other white spruces in North America—*Picea Engelmanni* and *Picea Pungens*; the latter is also known as "blue spruce." It is a rare local variety, never found forming forests; specimens are from 90ft. to 130ft. high, and from 18in. to 30in. in diameter. *Picea Engelmanni* is the most valuable timber tree in the Central Rocky Mountains, above 8,500ft. In Washington Territory, Oregon, and Montana it grows to a small size only, whilst at extreme elevations, it is reduced to a mere prostrate shrub; in the lower districts, however, it forms extensive forests, some attaining a height of 140ft., with a diameter of 48in. The following prices are now obtained for Canadian spruce deals in London. First: 3in. by 11in., £12 15s. to £14 10s.; 3in. by 9in., £11 15s.; 3in. by 7in., £12 10s.; 3in. by 6in., £11 15s.; 2in. by 8in. and 9in., £12 15s.; 2in. by 7in. and 10in., £12 10s.; 2in. by 7in., £12 15s. Second: 3in. by 9in. to 11in., £10 to £10 5s.; 3in. by 9in., £9 15s.; 3in. by 8in., £8 to £8 5s.; 3in. by 7in., £7 15s. to £8; 3in. by 5in., £7 to £7 5s.; 1in. by 11in., £10 10s.; 1in. by 9in., £10. Third: 3in. by 11in. £9 10s. to £9 15s.; 3in. by 9in., £9 to £10; 3in. by 8in., £8 to £8 5s.; 3in. by 7in., £7 10s. to £7 15s.; 2½in. by 9in., £8; 2in. by 7in., £7 10s.; 2in. by 6in., £6 15s.; 2in. by 5in., £6 10s.; 3in. by 11in., £9 10s. Fourth: 3in. by 11in., £8 to £9 10s.; 3in. by 9in. and 11in., £7; 3in. by 10in., £7 15s.; 3in. by 9in., £8 10s. to £9 15s.; 2in. by 7in., £10s. Qualities are sometimes sold mixed. For example, First, Second, and Third together are worth: 3in. by 11in., £7 10s. to £8 5s.; 3in. by 10in., £8 5s.; 3in. by 9in., £8; 3in. by 7in., £7 5s. to £7 10s.; 3in. by 5in., £6 15s.; 2½in. by 7in. to 10in., £6 10s.; 2in. by 9in., £3 10s.;

NATURE-PRINTED WOOD SECTIONS.—(SHOWING ANNUAL RINGS).

Five-eighth Actual Size (Linear Measurement).

2in. by 6in., £7. Unsorted: 4in. by 8in., £8 10s.; 3in. by 8in. and 11in., £8 5s.; 3in. by 8in., £7 10s.; 3in. by 7in., £7 15s.; 3in. by 6in., £7 5s. to £7 10s.; 2in. by 6in. and 9in., £7 5s.; 2in. by 4in. and 6in., £7; 2in. by 6in., £6 5s. The commonest lengths for yellow pine deals are 9ft. to 18ft; red pine deals, 11ft. to 18ft.; and spruce deals, 11ft. to 16ft. A wood sometimes imported with spruce is hemlock, but it is not extensively used here, being coarse-grained, brittle, and difficult to work, which makes it

unfit for joinery; as it is also a weak timber, it should never be used for joists. The botanical term is *Larix Canadensis*.

The accompanying nature-printed sections, reduced by photography, give a good idea of the relative widths of annual rings in various timber trees.

It will be noticed that in every case the rings become narrower as they recede from the centre of the tree; in trees of the same species the whole series of rings may be much narrower in

one tree than in another, and coarseness or fineness of grain is not a characteristic feature of any one species, whether grown in Europe or America. The sections of Red Pine, Yellow Pine, and White Spruce illustrate much of the matter in this and the previous article. On the top of the series a lineal inch has been drawn divided into eighths, which has been reduced in the same proportion as the sections. The relation of ring width to annual growth will be noticed in another article.

Building Intelligence.

OVERSTONE.—On Tuesday week the parish church of Overstone, near Northamptonshire, was reopened after restoration. The church, which is dedicated to St. Nicholas, was built in the year 1893. The alterations and additions, carried out in Weldon stone, consist of a south aisle, organ chamber, vestry, and porch; the tower (which was much dilapidated) has been reroofed, and new battlements and windows provided; the bells have been rehung, and an additional bell added. The works generally have been carried out in the best possible manner by the estate workmen, from plans and under the superintendence of Mr. J. Mander, architect, Overstone Park.

SCARBOROUGH, KENT.—The new schools erected for the Southborough School Board at High Brooms were opened by Sir Spencer Walpole last week. They are in two departments, and accommodate 252 boys and 220 infants, with an addition to the boys' seats being arranged so as to be overlooked from the central hall. Two scholars will sit at each desk, and there will be a space between the desks for physical exercises. The central hall is 54ft. by 26ft. The infants' school is similarly arranged, except that the long schoolroom has to be used for marching and drill, as well as teaching. The total cost will be about £7,500. The architect is Mr. C. H. Strange, and the builders are Messrs. Strange and Sons, of Tunbridge Wells, and Mr. H. Elwig was quantity surveyor.

CHIPS.

One of the last acts of the Pope before his illness was to order a commission of great artists and architects to examine into the present state and condition of the paintings in the Sistine Chapel. The commission is presided over by the painter Ludwig Seitz. On the 3rd inst. the commission made a close study of the ceiling, and came to the conclusion that the work of consolidation must be begun immediately. At the same time, the commission expressed great satisfaction at the marvellous preservation of the immortal paintings, and the small injury the lapse of time had inflicted upon them.

A statue of the late Queen Victoria, erected in the square opposite the town-hall at Portsmouth, was formally unveiled on Wednesday. It has been executed by Mr. Drury, A.R.A.

The Health Exhibition in connection with the Sanitary Congress at Bradford was opened on Tuesday afternoon by the Mayor of Bradford. The exhibition is an exhaustive display of all sorts of hygienic and sanitary appliances. The president of the congress (the Earl of Stamford) delivered his presidential address the same evening, and on Wednesday and yesterday the business of the Congress began with the meeting of seven sectional conferences. Nearly 2,500 delegates are taking part in the proceedings.

The Bracebridge Urban District Council, at their last meeting, agreed to nominate the same arbitrator as Lincoln—Mr. John Young, manager of the Glasgow Tramways—in the matter of the acquisition of the tramways from the private company which now owns them.

Mr. Lawton R. Ford has been appointed by the London County Council as district surveyor for West Wandsworth, in succession to the late Prof. T. Roger Smith.

The important site at the south-east corner of Holborn and the Kingsway, facing the Holborn Restaurant and opposite the Baptist Church House, has been acquired of the London County Council for £50,000 by the Great Northern and Strand Railway Co.

On Friday the rector of Mundesley, East Norfolk, entertained the workmen who for the past six months have been employed by Messrs. Wilkin and Randall, contractors, of Mundesley, on the restoration of the parish church.

Mr. A. J. Brickwell has been appointed surveyor to the Great Northern Railway, in succession to Mr. W. H. Elwell, who has retired.

Extensive additions to the Warrington water-works were formally opened on Tuesday week. The sum of £135,000 has been spent by the corporation during the last four years on new supplies. Hard water for domestic purposes comes from wells at Winwick, and soft water for manufacturing purposes from reservoirs at Appleton, in Cheshire. Further extensions at Daresbury are in contemplation at a cost of £50,000 or £70,000. The works have been carried out from plans by Mr. T. Longdin, water and borough engineer.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the BUILDING NEWS, Clement's House, Clement's Inn Passage, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to THE STRAND NEWSPAPER COMPANY, LIMITED.

Telegraphic Address:—"Timeserver, London."
Telephone No. 1633 Holborn.

NOTICE.

Sound copies of Vol. LXXXIII. are now ready, and should be ordered early (price 12s. each, by post 12s. 10d.), as only a limited number are done up. A few bound volumes of Vols. XXXIX., XL., XLVI., XLIX., LIII., LXI., LXII., LXIV., LXV., LXVI., LXVII., LXVIII., LXIX., LXXI., LXXII., LXXIII., LXXIV., LXXV., LXXVI., LXXVII., LXXIX., LXXX., LXXXI., and LXXXII. may still be obtained at the same price; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

Handsome Cloth Cases for Binding the BUILDING NEWS, price 2s., post free 2s. 4d., can be obtained from any Newsagent, or from the Publisher, Clement's House, Clement's Inn Passage, Strand, London, W.C.

TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 0d. (or 6dols. 30c. gold). To France or Belgium, £1 6s. 0d. (or 33fr. 30c.). To India, £1 6s. 0d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 0d.

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of eight words, the first line counting as two, the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Situations and Partnerships.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" and "Partnerships" is ONE SHILLING for TWENTY-FOUR WORDS, and Sixpence for every eight words after. All Situation Advertisements must be prepaid.

* * Replies to advertisements can be received at the office, Clement's House, Clement's Inn-passage, Strand, W.C., free of charge. If to be forwarded under cover to advertiser an extra charge of Sixpence is made. (See Notice at head of "Situations.")

Rates for Trade Advertisements on front page, and special and other positions, can be obtained on application to the Publisher.

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page Advertisements and alterations in serial advertisements must reach the office by Tuesday morning to secure insertion.

QUESTIONS.

[11991].—**Dry Rot.**—Can any of your readers tell me if there is any remedy for dry rot? I have a workshop and office which is badly infected, and the fungus grows very quickly during the present hot weather. I have consulted an architect, who tells me that the only thing I can do is to have the whole of the flooring removed and remake with bricks or quarries; but a boarded floor is a necessity. Shall be glad of any information enabling me to take out infected parts and replace with fresh boards without fear of having a recurrence in a year or two's time.—ENGINEER, Coventry.

[11992].—**Valuations for Probate.**—Would one of your correspondents, through your valuable paper, be good enough to give me some reliable information as to the fees chargeable for valuations of properties for probate? I have searched numerous handbooks and other sources of information, but fail to find any definite scale whatever, and the few tables that mention valuations under this heading do not say if they are for property or effects, and they do not even then agree as to the amount to be charged. The valuation in this case consists of a number of freehold and leasehold properties situate in

the N. and N.W. districts, some distance from each other, and all different and requiring to be viewed and valued separately; also a large number of plots of building land (freehold) situate on different building estates varying from two to eight miles apart and some forty miles from London, and all varying in value. I should be glad to know what is the usual scale adopted for valuations of this description.—ENQUIRER.

REPLIES.

[11984].—**Plaster of Paris.**—Perhaps "Plastering," by W. Millar, contains as good account as any on plaster of Paris. Published at 18s. net, by E. T. Batsford, 94, High Holborn, W.C. Chapter II., "Materials. Also something in A. H. Heath's "Lime and Cements"; ditto "Calcareous Cements," by G. R. Redgrave; ditto "Lime, Mortar, and Cement," by W. J. Dibdin.—REGENT'S PARK.

[11985].—**External Plaster.**—Probably not, as moisture affects them more or less. See books on Cements at Patent Office Library, viz.: "Plastering," by W. Millar; "Lime and Cement," by A. H. Heath; "Lime, Mortar, and Cement," by W. J. Dibdin; "Calcareous Cements," by G. R. Redgrave.—REGENT'S PARK.

LEGAL INTELLIGENCE.

WHAT IS "PORTLAND CEMENT"?—At a special sitting of the Croydon Justices on July 2, the Associated Portland Cement Manufacturers (1900), Ltd., of Dixon House, Fenchurch-street, E.C., were summoned by Henry Poston, architect and surveyor, of 39, Lombard-street, E.C., for having, on March 28, sold to George T. Hall, of George-street, Croydon, dealer in building materials, two sacks of cement to which a false trade description had been applied—viz., "Portland cement," contrary to section 2 of the Merchandise Marks Act, 1887. Mr. Horace Avory, K.C., with Mr. H. C. Biron, was for the prosecution, and Mr. Spencer Bower, K.C., with Mr. A. H. Bodkin, for the defendants. Mr. Avory, in opening, said that in law it did not matter whether the stuff falsely described was just as good as that coming correctly under the trade description, nor was it necessary to say that the person who bought it had not paid more than it was worth. Defendants were a large combination of cement manufacturing firms, and his clients were cement manufacturers outside that combine. Complaints caused two sacks of defendants' cement to be purchased of Mr. Hall, and it was analysed by Messrs. Stainer and Blount, chemists, who had special experience with cement. They found that 13 per cent. of this so-called Portland cement was an insoluble residue of sand and clay. Cement consisted of a mixture of chalk and clay in certain proportions, subsequently burnt in a kiln and finely ground. The real Portland cement was of an extra good quality, calcined so completely that but 1 per cent. of insoluble matter remained, accounted for by an unavoidable accumulation of dust in the process of manufacture or subsequent transit. The excess of insoluble residue in defendants' cement must have been added to increase the bulk and improve profits. Now what was Portland cement? In 1893, after three years' investigation, and to make no mistake about it, the Cement Traders' Section of the London Chamber of Commerce passed some resolutions. One was to this purport—"That Portland cement be defined as a mixture of two or more suitable materials, intimately and artificially mixed in the requisite proportions, and afterwards properly calcined and ground, to which nothing has been added during or after calcination excepting that an addition not exceeding two per cent. of gypsum is permissible for the purpose of regulating the strength." Further, it was also resolved that if anything beyond the gypsum were added the product was not to be sold as Portland cement, but under some other distinctive name. These resolutions were signed by numerous firms, of whom nineteen had since joined the defendants' combination. Therefore these facts Mr. Avory claimed to be to an extent an admission on the part of the defendants, and could be used against them. Evidence was given by Frederick Blyton, builder, 122, Kennington-lane, as to purchasing the two sacks of cement of Mr. Hall at the instance of Mr. Poston, on whose behalf he had also made similar purchases in other districts. Mr. Poston, in cross examination, declined to admit that two applications for a similar summons had been refused in the City by the Lord Mayor. Asked the names of the firms behind him in the matter, the witness objected, and the Bench ruled that the responsibility of answering was entirely a matter for himself; he declined. Cement which contained 13 per cent. to 25 per cent. of ground Kentish rag was not "Portland cement" in the trade meaning of the term. It was not the custom of the trade to accept as Portland cement any cement which contained more than 2 per cent. of gypsum. Mr. Bower: Does "Portland cement" in the trade mean any adhesive substance which, when in finished use, presents an appearance resembling, and has all the properties of, the stone known as Portland stone? Witness emphatically declined to accept this definition. "Portland cement" had a distinct trade meaning, in contrast to other kinds of cement. Mr. Bertram Blount,

F.I.C., M.S.P.A., deposed as to the analysis, and said he understood that Portland cement, as known to the trade, was simply chalk and clay calcined and then ground. It did not admit of anything being added, as it was then a finished material. Sir Alexander Binnie, Vice-President of the Institute of Civil Engineers, gave the opinion that the substance analysed by Mr. Blount was not Portland cement as generally known in his profession. He was aware that gypsum was added by some manufacturers, but he had never passed cement in which he knew it had been used. He did not know till he entered court that morning that English commerce had fallen so low as to add 13 per cent. of foreign substance to what was sold as Portland cement. It passed his comprehension how a body of manufacturers could come forward and boldly admit adding 13 per cent. of ragstone and call it Portland cement. Mr. Charles Neike, M.Inst.C.E., agreed with Sir Alexander's opinions. Mr. G. T. Hall said the cement in question was part of a large consignment. Having heard all the evidence, he felt that it could properly be described as Portland cement. The defence, as foreshadowed in the cross-questioning of witnesses, appeared to be that the inclusion of Kentish rag before grinding made the cement equal and even better than Portland stone, and would answer all the tests that could be given that stone; that in the strict trade understanding of the term it was Portland cement. Mr. Bower raised the question of jurisdiction, and it transpired that Mr. Hall carted the cement from Deptford. The defence urged that the actual sale took place there, and consequently the Croydon Bench had no jurisdiction. Mr. Hall said he received the invoice at his Croydon office. Mr. Avory submitted, therefore, that the contract was made in Croydon. The Bench retired, and on returning said that when the information was laid they were given to understand that the actual sale took place in Croydon. They now found it was completed at Deptford, and under the circumstances could exercise no jurisdiction in the case. Mr. Avory asked the Bench to state a case on the question of jurisdiction, should he think it worth while to appeal. The Bench agreed, and in dismissing the summons on the question of jurisdiction alone, made no order as to costs.

RAILWAY COMPANIES AND THE PUBLIC HEALTH ACT.—At Marylebone on June 15, Mr. Curtis Bennett had before him the case of the Hampstead Borough Council v. Tennant. The latter traded as Isaac Tennant and Co., builders, of Grange-road, Willesden-green, and had to answer seven summonses in respect to certain sanitary work done by them at the Finchley-road Station of the Metropolitan Railway. It was urged that the railway company were not amenable to the local authority; but the magistrate decided against them, and consented to state a case. The facts were reported in our issue of June 19, p. 877 last volume. An intimation was given on Saturday that the company were content to accept the magistrate's ruling, and that the case would not be proceeded with.

NIDD VALLEY ARBITRATIONS.—WINN AND THE BRADFORD CITY CORPORATION.—Lieut.-Col. W. H. Wellsted, C.E., the umpire in the above matter, has just issued his award, amounting to £14,585. The claim was in respect of 1,115 acres of leasehold land in the Nidd Valley taken for the construction of reservoirs and gathering ground for the Bradford Corporation Waterworks, and amounted to £28,220, whilst the value placed upon it by the corporation witnesses was £7,973. The arbitrator for the claimant was Mr. Thos. Fenwick, C.E., Leeds, and the witnesses were Messrs. C. R. Fenwick, W. B. Boord, John Maughan, Richard Horsfall, W. F. Tempest, and John Farrar. The arbitrator for the Bradford Corporation was Mr. Chas. Gott, C.E., Bradford, and the witnesses were Messrs. Fredk. Fowler, W. B. Woodhead, R. B. Broster, and George Runtou.

TENDERS AND DEPOSITS.—At the Liverpool County-court, on Friday, before his honour Judge Shand, Messrs. John Ainscough and Son, contractors, Oldham, sued Messrs. Beloe and Priest, civil engineers, Harrington-street, Liverpool, for the return of £5 5s, being a deposit on quantities and specification for the Fender Valley sewerage, in course of construction by the Wirral sanitary authority. A representative of the plaintiff firm stated that he saw an advertisement asking for tenders for the work, specifications and quantities to be obtained at the office of Messrs. Beloe and Priest on payment of £5 5s., which would be returned on the receipt of a *bona-fide* tender. He called there, got the specifications, and paid five guineas deposit. Subsequently, his firm's tender was accepted; but he found out that the specifications contained a proviso as to sureties for the carrying out of the work which he could not comply with. He declined to sign the contract, and ultimately applied for the return of the deposit, which was refused. For the defence it was stated that the deposit was forfeited by reason of the conduct of the plaintiffs, whose tender had not been *bona-fide*. They saw the specifications containing the proviso as to sureties, and they tendered knowing that they objected to the condition. Judge

Shand held that the plaintiff's tender was a *bona-fide* one, although they were unable to go through with it owing to the clause as to sureties. They might have been negligent in not reading the specifications, and the defendants might have been put to expense thereby, for which they might have a claim for damages. Judgment would be given for the plaintiffs, with costs.

BUILDING BY-LAWS.—APPEAL DISMISSED.—The Leeds Stipendiary, having ruled, in the case taken against Messrs. Haste and Brown, of the Hough End Tannery, Bramley, that where the floors of workshops are constructed with joists resting upon girders of steel, the requirements of the city by-laws do not require joists of the strength indicated by By-law 58, the Corporation appealed, and the appeal came before the King's Division of the High Court on Friday. The Court dismissed the appeal with costs, being of opinion that the by-law was intended only to apply to premises with wooden joists, girders, &c.

CHIPS.

The Duke and Duchess of Connaught visited Walthamstow on Saturday afternoon to open a new wing of the Children's and General Hospital for Leyton, Walthamstow, and Wanstead. The new wing, which consists of an out-patients' department with dispensary, an operating theatre with anaesthetic room, and a ward with fourteen additional beds.

A new drive and roadway along the cliffs connecting Birchington and Westgate-on-Sea was formally opened on Thursday in last week.

At the last meeting of the Education committee of the Southampton Corporation it was decided that the office held by Mr. J. H. Blizard, of that town, as architect to the late school board, be abolished, and that Mr. Blizard be requested to forward particulars of his claim for compensation under the Education Act.

The baths committee of Dundee Town Council are completing negotiations for a site for a new public washhouse and baths for the West End. The building will cost between £6,000 and £7,000. The central washhouse is to be improved at a cost of over £1,200.

The Salford Town Council have confirmed the recommendation of the building and bridges committee to approve the acceptance by the Manchester Corporation of a tender for the reconstruction of Prince's Bridge at a cost of £10,374, one-half of the cost to be borne by the Salford Corporation.

In view of the increasing responsibilities which will attach to their officials owing to the adoption of the Esholt sewerage scheme, the sewerage committee of the Bradford Corporation propose to create a new position, which will rank next to that of Mr. Garfield, the chief engineer, with a salary of £225 per annum.

On Saturday the foundation-stone was laid of a new church at Marsden Colliery. The church, which is being built from plans prepared by Messrs. J. Potts and Son, architects, Sunderland, will consist of nave, chancel, and vestry, and there will be a bell-turret on the west gable. The nave will contain sitting accommodation for 200 persons. Marsden limestone with freestone dressings will be used in building the outer walls, and the seats and other internal fittings will be of pitch-pine. Mr. W. D. Allison, of Whitburn, is the contractor.

Mr. Choate, the American Ambassador, will unveil the Emerson marble bust, and Mrs. Humphry Ward will unveil the James Martineau marble bust—both by Mr. George Frampton, R.A.—at the Passmore Edwards Settlement, Tavistock-place, on Thursday in next week, the 16th inst., at half-past three.

On Saturday afternoon the members of the Darlington Corporation attended at the opening of North Lodge Park, which had been purchased, and will cost, with the laying out, including a bowling-green and grand stand, rather over £13,000.

The urban district council of Walker-on-Tyne have instructed their surveyor to prepare plans for municipal offices and a fire-brigade station.

The tents occupied by the timekeepers and route guardians of the Gordon-Bennett Cup Race were supplied by the Willesden Paper and Canvas Works, Ltd., and also the flags—triangular and square—having direct signalling significance were made of Willesden paper.

At St. Saviour's, Southwark, on Friday, the Bishop of Rochester unveiled and dedicated a memorial window to the late Mr. James Frederick Field, surveyor and auctioneer, of Borough High-street, who was assistant treasurer of the Collegiate Church and member of the chapter. The window, which is in the north aisle, represents St. Augustine, Bishop of Hippo (354-430). It is designed by Mr. C. E. Kempe. The corresponding window in the south aisle was the gift of the late Mr. Field in memory of his father, and represented St. Switwin, who founded the Collegiate Church.

COMPETITIONS.

BLACKPOOL.—Some time ago the town council invited competitive designs for a new technical school to be erected on the Ruikes Hall estate at a cost of about £17,000, and after going through the various plans submitted, the awards have been made as follows:—First premium (£50), Messrs. Potts, Son, and Pickup, Bolton; second, Messrs. Cheers and Smith, Blackburn; third, Messrs. Simon and Crawford, Manchester. Messrs. Potts, Son, and Pickup were the architects for the new town-hall at Blackpool.

STOKE-ON-TRENT.—Applications for the appointment of an architect and surveyor to complete certain work at the workhouse hospital, the erection of a new mortuary, and the conversion of the existing building to other purposes, together with the modified scheme providing for certain alterations and additions at the workhouse, in respect of which plans had already been prepared and approved, were considered by the Board of Guardians in committee on June 25; and out of 24 candidates the following six gentlemen were selected to be interviewed by the Board:—Messrs. J. T. Brealey, Hanley; E. Jones, Hanley; A. P. Miller, Hanley; A. R. P. Piercy, Stoke; R. Scrivener and Sons, Hanley; and T. Tindal, Longton. At a subsequent meeting of the board a letter from Mr. Lynam, the architect who had prepared the plans, was read, asking whether the board would allow him to complete the quantities for the work, and pointing out that in any event he was entitled to his remuneration in full; but the committee recommended that his request be not acceded to. The voting for the appointment resulted in favour of Mr. A. P. Miller, whose terms for completing the building work in hand were 2½ per cent. on the outlay, which is estimated at £14,250.

The new Northern Cemetery for Salford at Agecroft was opened on Friday by the mayor of that borough. It has been laid out, and the buildings have been erected from plans by Messrs. Sharp and Fester, architects.

The mosaic in the entrance to the Ulster Hall, Belfast, into which is introduced the Belfast coat-of-arms, has been laid by Diespeker, Ltd. This firm is also laying the mosaic in Purdysburn Asylum, near Belfast, both contracts having been secured in competition with other firms.

The opening of a new wing of the Darlington Female Training College took place on Friday. The additions have cost £5,600, and have been carried out from plans by Mr. Pritchett, of Darlington.

On Friday the opening took place of the new Hastings Wing of the Queen's School, Chester, which has been built at a cost of about £2,000 from plans by Mr. E. A. Ould, of Liverpool.

The top stone of the central tower of Truro Cathedral was laid on Friday by Mr. S. M. Dennis, son of the donor of the tower, Mr. James Dennis, of Grenehurst Park, Surrey. The vane was placed in position by Mr. E. T. Price, the clerk of works. The tower will cost £15,000. Except for the two western towers, which are estimated to cost £7,000 each, and will not be proceeded with until the cost is offered to the cathedral authorities, Truro Cathedral is now complete. The nave will be formally opened by the Prince of Wales on the 22nd inst.

The additions to the Borough Sanatorium, Brighton, are being warmed and ventilated by means of Shorland's patent double-fronted Manchester stoves in richly glazed faience, the same being supplied by Messrs. E. H. Shorland and Brother, of Manchester.

The Hampstead Borough Council will consider, next week, a recommendation from a special committee that the plans for the alteration and extension of the town-hall, at an estimated cost of £7,972 for building works and £2,000 for additional land, as prepared by Mr. John Murray, F.R.I.B.A., be adopted.

At the next meeting of the West Riding County Council it will be proposed that the department of the surveyor and architect be divided, and that Mr. J. Vickers Edwards remain the architect at £1,500 a year, and that he give the whole of his time to the duties of the office.

The death is announced from Yealmpton, Devon, of Mr. William Drake, of the firm of Messrs. Cowley and Drake, of Willesden Green, N.W. Mr. Drake, who was in his fiftieth year, had been unwell, and was staying at his native village when he died. Among the works carried out by the firm are the Passmore Edwards Cottage Hospital, the Court House of the Middlesex County Council, and some board schools, all at Willesden, and many buildings in London and its vicinity.

HARROGATE PUBLIC BUILDINGS.—LIVERPOOL CATHEDRAL DESIGNS.—PASSMORE EDWARDS ADMINISTRATIVE BLOCK, CHALFONT.—SEACROFT GOLF LINKS HOTEL, SKEGNESS.

Our Illustrations.

HARROGATE MUNICIPAL BUILDINGS.

MR. HENRY T. HARE, F.R.I.B.A., is the architect of this building, but no further particulars are to hand.

LIVERPOOL CATHEDRAL: SELECTED DESIGN.

This sheet of details, giving a bay of the choir and a bay of the nave of this great church, shows the purity of the Early style adopted by Mr. G. Gilbert Scott, while the touch of Flamboyant fancy in the tracery of the windows imparts a degree of freedom hardly observable in the general drawings already published during the past month or so in our pages. The bay of the nave illustrated is one of the low ones which occur between the dormered bays called transepts, and which correspond with the high bays of the choir in their general proportion. The single-page plate herewith given shows the choir end and tower and spire of Mr. Malcolm Stark's proposal for the same building. We have already illustrated in detail the entrance end of his design, and given his plan.

THE PASSMORE EDWARDS ADMINISTRATION HOUSE AT THE COLONY FOR EPILEPTICS, CHALFONT ST. PETER.

This building, which is intended to serve as a central administration house for the colony of the National Society for Employment of Epileptics, has lately been commenced, and the foundation-stone is to be laid on the 21st inst. by Sir William Broadbent. The plans have been prepared by Mr. Charles Grieve, of Lumb Building, Temple, E.C., and in view of the fact that the population of the colony—at present about 200—is constantly increasing, the building has been designed specially with a view to facility for enlargement to meet future needs. The accompanying drawing shows the house as it is now being built, with the addition of a committee-room and staff dining-room which are likely to be added at an early date. The building is situated in a central position, the men's department of the colony being near at hand on the right, and the women's department on the left, while the future homes and schools for children will be in the rear. The accommodation on the ground floor comprises, in the front of the house, the matron's sitting-room, and office on either side of the hall. The committee-room and staff dining-room, when added, will form a right and left wing respectively, and will be approached by the transverse corridor. A passage through the centre of the building leads from the hall to the kitchen, and has on the one side a lavatory, a dispensary, and a general store-room; and on the other a pantry, sewing-room, and linen store, and assistant matron's room. The kitchen is intended to serve as the central kitchen of the whole establishment, and behind it is a covered space for the trolleys in which the cooked food will be conveyed to the various homes. The larder and milk store will be partially underground, and over them will be a boot-room. The upper floor comprises bedrooms and other accommodation for the matron, assistant matron, servants, and visitors. Near to the administrative house, on the left, is the laundry, and amongst future developments of the colony it is pro-

posed to erect between these two buildings a water-tower and also a power-house, wherein steam will be furnished for cooking and laundry purposes, and wherein electricity will be supplied to the various homes and other buildings of the colony for purposes of light and power. The entire cost of the building now in course of construction will be about £3,000, and this sum will be provided by a donation from Mr. J. Passmore Edwards, who, it may be mentioned, has already given for the purchase of land and erection of homes at the colony, contributions amounting in the aggregate to £15,500.

SEACROFT GOLF LINKS HOTEL.

This building was designed by Messrs. Brewill and Bailey, architects, Nottingham.

Our Office Table.

THE premises of the Royal Architectural Museum, in Tufton-street, Westminster, have, after unexpected delays, now formally passed into the possession of the Architectural Association, and tenders are being invited by the committee for carrying out the necessary alterations in accordance with the plans prepared by Mr. Leonard Stokes. Several changes in the personnel of the A.A. Day School, now conducted at 56, Great Marlborough-street, are about to take place. Mr. Arthur T. Bolton, who has rendered excellent service in the initiation and conduct of the school as headmaster, is relinquishing the post on the completion of the two years for which he was appointed, and the committee have nominated as his successor Mr. H. P. G. Maule, who has been one of the honorary secretaries of the Association for the last two years. Mr. Louis Ambler, late vice-president, will succeed Mr. Maule in the post thus vacated. The annual excursion of the Association will be held during the week after next, from Monday, the 20th inst., until the following Saturday, the 25th. Worcester, as in 1881, will be the headquarters, and among the places to be visited are Mere Hall, Huddington Court, Westwood, Eastington House, Birt's Morton Manor, Great Malvern Priory, Hampton Lovett, Harrington Hall, Chaddesley Corbet, Grafton Manor, Bredon, Overbury, Woollas Hall, The Littletons, and Evesham.

A TWO-DAYS' exhibition of drawings done by architectural students of University College, Liverpool, during the past session, under the direction of Professor F. M. Simpson, who is leaving Liverpool to accept a similar Chair of Architecture at University College, London, in succession to the late Professor Roger Smith, was held on Friday and Saturday in the architectural studio in the college. The drawings comprise the work executed by students of the advanced and junior design classes, and also first and second year students' work. The sets of drawings which gained first prizes for design in the evening advanced classes were those of T. Capstick and A. Landstein. They comprised a series of elevations, plans, &c., of five cottages, an artist's house, a chancel to a town church, a small school, a summer residence, a fireplace in a dining-room, a golf clubhouse, and a pair of semi-detached houses. Honourable mention in these subjects was awarded to F. Wrennall. The chief features of the first and second year students' drawings are the designs for a small country house by J. G. Birch and Baruish; whilst an essay by the latter on the Renaissance architecture of Italy, France, and England attracted interest by the exhaustive series of drawings which ran through its pages. Another contribution of this nature is the work of K. Cameron. Prominent, also, are the drawings, of last year, by L. P. Abercrombie. They include designs for a staircase, a country house, and a gallery, and are severely Classic in character. A country house by Mr. Quiggin (last year), together with drawings of shops with offices over them, and a stable, are also hung. In the junior class drawings, the first prize is taken by J. W. Cabre with a staircase, semi-detached houses, dining-room decoration, and a country inn; and the second prize by P. Dawson with a small lodge, decoration for dining-room, and a semi-detached house. Honourable mention in this department was gained by J. Pearce. The work executed by the second-year day students includes staircases, windows, domes, billiard lanterns, and examples in Gothic architecture, the special subject being the Pilgrims' Chapel at Highton-le-Dale.

WITH reference to the County-court case from

Salford reported in our last issue, p. 30, where Judge Parry made strong remarks as to the practice of furniture dealers describing as "solid walnut suites" articles only veneered with that wood, Mr. James Shaw, of Manchester, points out that some years ago furniture was entirely made by hand, and the exterior or polished parts of most of the walnut furniture then manufactured was made of common deal or pine, veneered over with walnut. Invariably this class of furniture was extremely poor in quality, and the term "veneered" became a term of reproach. To-day machinery enters largely into the construction of the finest class of furniture. Veneered work cannot be done by machinery, therefore the solid wood must be used in all good-class machine cabinet-work, and the furniture so made is distinguished from veneered furniture (which is still made in small quantities) by being termed "solid walnut." It is, he says, a surprise to the whole trade to know that the term "solid walnut" is understood to mean "all walnut." Most people, he adds, know perfectly well that a piece of walnut-wood furniture is not wholly composed of walnut, any more than a suit of broadcloth is wholly composed of broadcloth.

Trade News.

WAGES MOVEMENTS.

BURTON-ON-TRENT.—Mr. A. A. Hudson, barrister, who recently sat as arbitrator in reference to the claims of the Burton builders' labourers for an increase in pay of from 5½d. to 6d. per hour, has given his decision. He awards the men another farthing, and this will be binding for three years.

CHIPS.

The new English Presbyterian Church at Wepre, Connah's Quay, was formally opened on Friday. The building has cost £3,000. The architect was Mr. Smith-Ridgfield, Manchester, and the builder Mr. T. J. Ren, Connah's Quay.

At a meeting of the King's Norton and Northfield District Council, Mr. Harold F. Waller, assistant in the surveyor's department of the Sutton Town Council, was appointed building inspector at a salary rising from £120 by annual increments of £15 to £150.

Sir Samuel Montagu has placed at the disposal of the London County Council £10,000, for the provision of working men's cottages at Edmonton. The Council will build from 400 to 500 cottages.

A new Wesleyan chapel is being built in High Park-road, Southport, from plans by Mr. F. W. Dixon. It will accommodate 680 persons, and will cost £4,000. The foundation-stone was laid on Saturday last.

A new public school is about to be built in Hareham-road, Kingswood, Bristol, from designs by Mr. J. Mackay, of Kingswood. It will be Elizabethan in style, and will accommodate 930 children in three departments.

An assembly-hall with a dramatic license is about to be erected in the Town Hall-square at Rochdale. The contract has been taken by Mr. Thomas Hargreaves, of that town.

The light railway which connects Fraserburgh with the fishing villages of Cairnbulg, Inverallochy, and St. Combs was opened for traffic on Friday. The distance to Cairnbulg and Inverallochy is 3½ miles, and St. Combs 5 miles.

The parish church of St. Mary, Fordingbridge, Hants, was reopened by Bishop Webb, Dean of Salisbury, on Tuesday week, after restoration. The architect was Mr. C. E. Ponting, of Marlborough, and the contractor Mr. Kite, of Salisbury.

The inhabitants of Keighley are to be presented with a new clock and chimes, to be erected in the tower of the parish church. Messrs. Wm. Potts and Sons, clock manufacturers, Leeds, the makers of the Prince-Smith memorial clock and chimes, also at Keighley, have the work in hand.

Mr. Ernest Runtz states that in consequence of the death of Mr. Albert C. Breden, the name of his firm will in future be known as Ernest Runtz and Ford. Mr. Geo. McLean Ford, A.R.I.B.A., who has been associated with Mr. Runtz for upwards of twelve years, is now his sole partner.

The Whitehaven Rural District Council have adopted a scheme of water supply for the six parishes of Gosforth, Ponsonby, Haile, St. John's, St. Bridget's, and Lowside Quarter at an estimated cost of £13,800. There will be over 20 miles of mains. The scheme has been prepared jointly by Mr. G. Boyd, surveyor to the council, and Mr. Harry W. Taylor, A.M.I.C.E., Newcastle.

THE BUILDING NEWS

AND ENGINEERING JOURNAL.

VOL. LXXXV.—No. 2532.

FRIDAY, JULY 17, 1903.

MUTILATED BUILDINGS.

ONE of the obvious defects of modern architectural design is the want of solidity. A very large proportion of our commercial and public buildings comprise only one or two fronts, the remaining sides being roofed at a lower level, and presenting very irregular elevations, as if the cubical capacity could not be filled up, or that the scale of the plan was too large to admit of more than portions of it or one or two fronts being carried up above the ground story of the building. We are accustomed to see public edifices, especially churches, only partially completed. It is very usual to find a new church consisting only of a fully-built chancel, with a low-roofed, unfinished shed-like structure leading up to it at one end, or a mere corridor or shanty of corrugated iron; sometimes a partially-built nave without a chancel, indicating the relative importance attached to these parts by the promoters or builders; but such mutilated structures we can understand, awkward and ugly as they are for a long time. We regard them simply as incomplete structures, the same as we should a large public institution like a hospital or a school, where perhaps only one wing of the building is erected, presenting an unsymmetrical façade. But this argument does not apply to many buildings which are planned and designed as a dismembered whole, where perhaps the whole rear portion has been designed as a one-story building, or only built up in parts, while the main elevations to the streets are of several stories. The architect may tell us economy has been the chief object in this incomplete and often chaotic design, or that light to some of the interior corridors and rooms could not have been obtained in any other way than to top-light the rooms behind. Circumstances no doubt create conditions, and sometimes a top-lighted back area, as in a large shop area that occupies the whole dimensions of the land, is the only alternative. But this condition does not invariably apply. Perhaps a large plot of ground forms the site, with a street or streets on one or two or more sides, and the architect is not compelled to utilise the whole of the area. He has, then, his own choice. A certain accommodation or area is required. Two or more alternatives are open to him: he can cover the whole area with a one or two-storied building, or he can set apart a portion of the site for open spaces for light and air or for extension, and on the other portion of site he can erect a three or four or five-storied building, as necessity requires, over the whole area of such portion; or he can extend the limits by erecting a portion high and a portion at a lower level. He has thus freedom in making his building a solid-looking compact whole on either of the two first-named plans, or in designing a partial or mutilated structure. There are, indeed, some cases where circumstances compel the designer to adopt the partial or mutilated plan. One of these is when the site is closed in by high buildings on one or more sides at the back, or the existence of "ancient lights" in the adjacent premises. In one case the architect is often obliged to provide light areas or courts; in the other, to roof a portion of his building at a lower level to allow the dominant tenement windows to receive their light. These are conditions which compel the architect to adopt roofs of different levels, and thus to cut up his building in a most unsatisfactory manner. But with some architects these are not the only

reasons or exceptions. There is another reason. The designer is one who may be a skilful arranger of plans, but has no ability in grasping the whole in his mind, the plan and elevations. He can puzzle out his ground-floor plan with economy and skill, but he does not trouble to consider how that plan will affect his elevations or his roofing problem. These are matters he leaves to his elevations when he comes to them. If he wants a top-light for a corridor or some offices, he does not scruple to provide one, regardless of the consequence to his back elevation; any idea of rubbing out the scheme and thinking of another that will enable light to be got for the said offices by a small court area is out of the question—it involves too much trouble. To very few are given the gift of thinking in the solid, if we may so term it, of viewing the relation of plan to height and elevation, and it is this power—the modelling faculty, of seeing things in the concrete, or as they will appear when built—that is wanted in the architect. Some men are good as planners, others as elevation designers, but it is not often that we see the double or combined power, and no doubt it is this lack of seeing all round at once, if we may say so, that makes the art of architecture so much more difficult and complex than those arts where the attention is confined to surfaces, as in drawing and painting. The designer of buildings ought to be able, after he has sketched out the plan of his room with its windows, and door, and fireplace, to imagine its effect when built in its height and proportion, and how it will appear in connection with the corridor, or lobby, or anteroom, and he should further be able to realise in the mind's eye the external appearance. In planning, the mind is engaged in one operation in laying down on a horizontal plane the lengths and widths of rooms and corridors, a section of the building at a certain level; the great importance of the operation may be an excuse for neglecting to consider the third dimension, or height of the various parts. Yet the art of arrangement can only be very imperfectly performed unless the designer keeps in his mind the main internal divisional walls which go up and form the masses of the building, and not the least the scheme of roofing above. These main walls must always control the divisions or spaces between them, as we notice in the best plans; whenever they are disregarded the composition or external grouping fails.

The distinct treatment of plan from external design has almost come to be regarded as a merit instead of a vice by many in the profession. Probably it arises from the false separation of the useful from the beautiful in architecture. Subdivision of the architectural functions has much to do with it. The specialists who have made certain kinds of building their study are strong in plan, and often regard the elevations with indifference. It is common for the architect who makes a clever plan to engage a draughtsman, or "ghost," to draw the elevations for him. We can hardly expect separation of plan and design to produce solid and coherent buildings, because each artist has been working regardless of the other. The expert in plan has arranged his departments and rooms, quite unheeding how they can be treated or grouped externally, while the elevation draughtsman tries to ignore any part of the plan which does not lend itself to his preconceived idea. So it has happened that the two parts of the design do not form one coherent whole, and the profession give themselves up more to the particular part of the work they like best. In a great many buildings plan is all-important, and elevation does not count for much, so it is not studied with all the attention it ought to be. Take a competition set of designs for a town-hall and offices, in which a good plan is the

main consideration. Very few of the designs show a study of the building in its completeness; they are either strong in plan or elevation. But we notice more particularly a class of designers who, while they send in good plans, make a wreck of their elevations: those who mutilate their designs by cutting down the upper stories in the most reckless fashion. They send in one good elevation, but all the others are mutilated. Thus, after turning one corner of the front, the other front drops down suddenly to perhaps the ground story, leaving the façade a mere mask of perhaps one room, behind it a waste of skylights and flats. These would provide top light to certain official departments and corridors in the rear. More solidity can be obtained by carrying the stories of the front round at the side, so that a view of both fronts would not disclose the low-storied part. The back elevation of such a design, if there is any shown, is very unsightly and undignified. It shows an ill-assorted row of skylights and lanterns and chimneys of all sizes and heights. Behind the ambitious façade, towards the main street, the illusion of dignified architecture is suddenly dispelled by a bare wall rising above the ground story flats. There are many odd-shaped and unsightly projections. Could there be anything more shocking to the nerves of the sensitive artist than such an utterly sham building? We cannot call it architecture. It is really the masking of a one-story structure with façades; in one or two competitions we saw lately the ground story, top lighted, exceeded in area the portions of the design carried up. In a design for a bath or washhouse the low-storied or top-lighted area naturally preponderates, while a second story structure for slipper baths, caretaker's rooms, &c., becomes necessary in town sites. Also in the case of a public library on a closed site, the reading and newsrooms are often better lighted by lanterns or top lights, and even a portion of the leading department may be so lighted, the upper stories in front and sides being set apart for reference, store-rooms, or librarian's rooms. In a town-hall the large assembly-hall, if on the ground floor, is better top lighted, and the same mode is desirable for the council chamber and magistrates' courts. For large bank apartments, halls, and vestibules or corridors there are decided advantages in dark town sites in adopting the same method; but the architect should not lose sight of the external design, and endeavour to confine these top-lighted or low-story areas to the inner portion of the site, leaving a solid range of storied buildings on the main sides at least. On a restricted or town site this solidity and compactness is more necessary than on an open country site, if we desire to preserve an architectural character. Notwithstanding this, the necessity of top lighting increases in towns according to the density of surrounding buildings; just in the same proportion as the necessity of increasing the number of stories. These concurrent facts add greatly to the difficulty of interior planning. Luckily, however, the restricted town area lessens the desirability of lighting large interior rooms, and the smaller the area the more easily can the rooms be lighted through windows in the outer walls. In short, the less the building area, the greater the necessity of increasing the height of the building, and the greater is the value of top-lighting on the ground floor. The light well or shaft becomes a necessity in such cases to avoid illuminants. The only other method is the Luxfer Prism method of radiating or diffusing daylight. On the other hand, the larger the building area the less the necessity of height, and the less the apparent value of top-lighting. In fact, the problem of the relation of size of building area to lighting and to architectural solidity is a very important one to the architect. Compactness and solidity are best attained, therefore, in towns where

space is limited. There are certain evils to be avoided where the half-solid and half-single storied method of building is adopted. One is the introduction of architectural features, as in a façade made up of gabled storied wings or pavilions towards the main front. If this front extended only one room in depth, the side or perspective effect would be aggravated, for it would reveal these features cut down as it were at every little depth from the front, whereas features of this kind suggest at least considerable depth from the front and component parts of the building. The plainer and the more unpretentious the raised portion is, the better. But the desire for display and embellishments seems the stronger when only a thin superficial façade is possible. The designer of shallow fronts appears to delight in pretentious features or eccentricities. He makes the most of his small resources, whereas in the solid building there is more thoroughness and honesty apparent. In fact, shallowness appears to encourage the defects we have referred to. Let us not be misunderstood. No architect can help the awkwardness and impossible conditions of irregular sites; nor can he avoid keeping some portions of his building low when lighting is the first consideration, and unnecessary expense is to be saved; but there is no excuse for him to make his building unsightly by cutting down portions of it in the most reckless manner. Solidity is one of the qualities of good design; we do not mean heaviness or lumpiness, but that regard for thoroughness and honesty which should characterise every building. Our young architects have not the training in composition and modelling which the French and American schools encourage—principles so essential to real artistic work. The elements of massing so important in all monumental architecture are not made a distinctive part of architectural training: we mean the arrangement or grouping of the main parts of a building or its principal rooms, so as to insure a pleasing perspective from certain points of view, in which the scheme of roofing and the intersection of blocks that will produce a pleasing combination or aggregation of parts are included.

EXHIBITION OF WATER-COLOUR DRAWINGS.

AT the Fine Art Society's Rooms, 148, New Bond-street, an interesting selection of water-colour drawings and sketches are now on view. These are by various well-known artists, and represent many Continental, Moorish, and British subjects and landscapes. The drawings or sketches by Frances Hodgkins are remarkable for their truthful impression, richness of colour, and brilliant effects of sunlight, chiefly illustrating Tetuan, the seaport of Morocco, on the north-west coast of Africa. The subjects, "A Moorish Shop," "The Dyers' Courtyard, Tetuan," "Oranges and Onions," "Tangier Market," "Sunshine and Whitewash," are charmingly real, and drawn with much breadth and directness, and show this lady painter's impressions of Moorish life. The delicate tones in Russell Dowson's "Antibes" (11) may be mentioned as a dexterous example of sunlit effect in this French town. Next J. Richard Bagshawe has a sketch from his vigorous pencil of one of those fishing-boat scenes he has made his study. "A Grey Dawn" shows a sea-tossed fishing-boat, with its crew pulling in a net at the side of boat. The artist has clearly been an eye-witness, and his handling of the rough sea and the grey tones of morning are admirable, and realistic of this arduous occupation. John Fulleylove, in his "Valley of Hinnom, with Hill of Offence," gives a faithful transcript of this Eastern scene. J. W. North, in his extremely delicate and dexterous piece of craftsmanship, "The First Day of a Late

Spring" (15), reminds us of a picture of his in this year's Academy. It is a woodland thicket; the brilliant golden and green tints of early foliage are depicted with wonderful grace and minuteness, set off against the distant undergrowth of trees. Hubert Coop's work, of which we see two examples in the room, is clever; but his colour, light, and cloud effects remind one of moonlight. Here, in "Conway, N. Wales," the sun is hidden behind clouds which are tinged with his radiance, and the water and boat and distant scenery are painted in the bluish-grey tones of colour and shadow we are accustomed to see in a moonlight picture. The other view, with boat and fisherwoman and child (62), and soft bluish shadows, is equally suggestive of moonlight. Jessie Douglas, in her Donegal interior, "A Sprigger" (17), is pathetic in its sombre shade. A woman at her work in a dark cottage, the embers of a wood fire burning beside her. John Fulleylove's view of the "Upper Valley of the Kedron" (18) is interesting. Next A. N. Roussoff has a clever drawing of "Court, San Rocco, Venice," with its fine campanile. W. Lee Hankey, in his "Fruit Stall," a group of girls at their stalls, exhibits strength and tenderness of colour. Claude Hayes sends a large hilly landscape, "Near Conway," with sheep in foreground—broad and skilfully handled. C. Macintyre Grierson, in "The Potato Planter," has given us a study of peasant life—a girl planting potatoes on rough ground, strong and realistic. Lexden L. Pocock, in "The Strayed Lamb," is a cleverly-drawn incident; a lamb has slipped down a steep bank, and has been caught in the branches of a small tree overbending a stream, and is being rescued by a young shepherd. "A View from St. Mark's, Venice," by Reginald Barratt (26), and Graham Petrie's "Lion of St. Mark" fully realise the classic ground. Mary Barton has been making Nice and the south of France her hunting ground. "The Cypress Avenue, Villa Arson, Nice" (28), is a noble avenue, and is solidly and feelingly painted. J. L. Gloag is still impressionist in his colouring. There is an intensity of green, and lack of a real perspective in his otherwise interesting study, "The Orchard." Edith A. Tye sends a delightful study called "Silver and Gold," thistle blossoms and seedlings, drawn with tenderness, and charming in colour. G. C. Haite's "Venice from the Public Gardens" is also a masterful drawing, brilliant and rich in colour. The little decorative theme, "The Sea People," by St. George Hare, R.I., is pleasing in drawing and sentiment. Godfrey Merry in his reminiscent scene, "A March of the Irish Guards," has depicted the guards marching to a band from the direction of Hyde Park Corner, which forms a good background. The troops' movement to the time of the drum is skilfully suggested. J. L. Gloag is again seen in his figure subject in the centre of the room, "That Woman's Toy: a Baby." A delicate-looking mother reclining on a couch with an infant, while at foot is a little girl nursing a doll. The theme and sentiment are cleverly treated, and the drawing is good. Below this subject is a decoratively-treated subject, "Winter Gleanings"—two little girls clad in rose-coloured frocks, carrying bundles of wood. They are descending some steps next a cottage or shed, leafless trees forming a background. The girls and the light tones of their dresses are gracefully composed, and the work is by Minnie Smythe, A.R.W.S. Maude Angell, in her flower subject, "Gloire de Dijon" (41), and Bertha Maguire's "Roses" (37) are clever. There is inspiration in Henry M. Rheam's subject, "The Witch"—the figure of a woman standing performing her incantation. Mildred A. Butler, A.R.W.S., in "The Gateway" shows her ability and simple treatment. Frank Walton, R.I., has a pleasing view of

"The Battery, Sark"—a group of rocks in the sea. Frank Saltfleet has a good drawing of Greenwich Pier, showing the Hospital and craft on river. A picturesque old-world street, "Chagford, Devon," by Yeend King, V.P.R.S., is interesting as a sketch of the Devonshire village under a brilliant sun. "The Medici Gardens," by F. A. Rawlence, is a nice sketch, and Saml. J. Hodson's "Palazzo Pubblico, Siena," is a good drawing of the Gothic Palazzo and the Campanile. L. Block gives us one of his inimitable groups of old books, "Such Heaps of Written Thought: Gold of the Dead" (52). A picture gallery is scarcely complete without a work of that brilliant painter of Cornish seas and harbours, John R. Reid, who has "A Cornish Fisherman" (54). The intense green sea is full of quivering light and movement. "San Vitale, Ravenna," is a favourite typical octagon church of the Byzantine period, and A. N. Roussoff's view of the interior is careful in drawing. J. Walter West, in his pretty piece of sentimental *genre*, a young lady with a rose bowl on a marqueterie cabinet, is scholarly and refined. "After-Glow on the Indian Ocean" (58), by Arthur Severn, is a skilfully studied effect. A. W. Weedon, as usual, is charmingly real in his haymaking scenes. Here is one in Sussex (63), a meadow with river winding through it under a summer sky—a good example of his work. There is much beauty of design and rich colour in Alfred East's fine "Golden Autumn," one of the best pictures here. We see the painter at his best, a golden sunset on lofty trees with cottage. The soft blended colour of the foliage suggests a free use of the sponge, which imparts just the sense of glowing vibrating light and colour seen in a strong sun on foliage. The weird desert scene by R. Talbot Kelly, a sandy stretch of the Desert with a solitary camel and rider in the distance, is truthfully depicted. There is excellent character and skilful drawing in Tom Brown's "A Corner of Volendam, Holland." Two old Dutchmen smoking sitting down against a wooden cottage, and one lad standing beside them, yonder is a distant shed and glimpse of sea, clever in composition and colour. Then we have a pleasing study, Kate M. Wyatt's, "A Spring Idyll," Tom Robinson's "In Glen Cloy, Arran," (73), a strong work. Walter Langley, R.I., is represented by "A Cornish Fisherman," an old fisherman of the village, seated, pipe in hand, musing, with a newspaper on his knees; the background thoroughly characteristic of a Cornish coast. The expression on the old man's face, who is pondering over something he has seen in the paper, is true to nature, and the colour is restrained and quiet, if less vigorous in handling than Mr. John R. Reid's work. J. Shaw Crompton's "A Sheep in Wolf's Clothing" is an incident told with much power. The young man who has entered the parlour of a country inn, quite unaware of the presence of an officer in uniform, is intended no doubt to be a deserter. The drawing of "St. John's College, Oxford," by R. Phéne Spiers, is well drawn in the details of the Late flat mul-lioned, corbelled bay windows and gable, with its embattled parapet. There are other interesting sketches which are worth a visit.

HOSPITAL DETAILS.

IN the section on engineering and architecture of the Sanitary Institute Congress, held at Bradford last week, papers were read on a few subjects of interest to the architect—one the "Details of a Hospital Ward," by Mr. A. Saxon Snell, F.R.I.B.A. Mr. Snell spoke of some old principles of ward construction which ought not to be forgotten. There is a tendency to consult new ideas at the cost of neglecting certain important sanitary principles. The author refers to several instances of new wards constructed upon the latest principles which have proved unsuccessful. As he says: "The old wards were known

to be dangerously unclean, and special precautions were therefore taken to counteract their condition. The new wards were so very bright and clean that anything but perfunctory cleaning was scarcely thought necessary. In the old wards (which were dangerously unclean) the windows were kept open, and the very walls, innocent of plaster, were porous enough to be an assistance to ventilation. In their view it appeared that the provision of air inlets was thought to obviate the necessity of opening the windows." Another example of the neglect of well-worn principles is given. "The drainage of a certain building was relaid upon modern principles with manholes at every branch and change of direction. The old drains were always flushed periodically, and thus kept fairly clean. The new drains were supposed to act for ever without such assistance." The author says, five years after they were laid he made an examination of the system, "and was compelled to use a crowbar to open the covers of the manholes, which had never been touched since the drains were first laid." These are instances of the adoption of new methods of inspection which are never properly utilised. In another case the inlet ventilators of a ward were expensively constructed with glazed pipes. On visiting the hospital a year afterwards he found those flues black with dirt. They were never cleaned. Everyone knows it is an accepted principle of ward construction that all angles and corners should be rounded, so as to avoid all sharp angles and deep-cut mouldings where dust and dirt can lodge, and yet this principle is often subverted by the adoption of methods of flooring which harbour disease germs. The insistence of floors of smooth and impervious materials free from holes or crevices is one that cannot be exaggerated. Therefore, the author says plain-jointed soft wood floors are objectionable, as such wood shrinks, and thus leave joints for the secretion of dust and dirt, and are, moreover, absorbent. Speaking of hard wood floors, Mr. Snell has been in the habit of adopting kiln-dried maple in narrow widths, which is an "exceedingly hard and unwearable floor, its light colour showing up dust more readily than dark woods." Oak and teak are commonly used, and the author says that terrazzo floors are advocated on account of their impermeability, though this is questionable, he thinks, when the high polish is worn off the cement. Asphalte is also useful, but its dark colour is against it. As for finishing wooden floors beeswax and turpentine are recommended. The author speaks also of the importance of well rounding the angle between floor and skirting, a radius of 2½ in. to 3 in. being used; but Mr. Snell thinks 1½ in. radius enough, and this hollow or rounding must be formed of the same material as the floor. Sometimes hollow bricks are used for the hollowing, but the joints are numerous. On the question of wall surfaces the author does not discuss the advantages of either the porous or impermeable wall. Hygienically, we should prefer for hospital walls the cavity principle of construction, with materials sufficiently permeable to allow a degree of transpiration; but modern hospital practice has adopted the impervious walls, and the object aimed at is to make the interior wall surfaces as smooth and hard as possible, so as not to retain dust, and to be capable of easy cleaning. The germ theory is accountable for this view as well as for other modern ideas of construction, such as the rounded corners and angles. The hospital ward is often lined with tiles which make an impervious and clean surface; but practically the numerous joints are against it. A more perfect and smooth surface may be insured by a trowelled cement surface painted with enamel paint. Mr. Snell says: "It is scarcely possible to obtain a more generally smooth surface than trowelled cement—Keene's or Sirapite. These can be brought to a polished surface. It is difficult, if not impossible, however, to obtain a really even colour. Although enamel paint can be used with decorative effect, pictures would still be required to decorate the walls, and the ordinary framed picture is a veritable dust-trap. Therein tiled surfaces have the advantage of painted walls, as they can be decorated with permanent pictures painted on the surface. . . . It would be possible to cover permanent wall paintings with glass let in flush with the wall surface, and I am not sure that this has not been done." There is an important suggestion here. We believe that for ordinary wards, painted tile pictures of a quiet character

and tone could be one of the best substitutes; a better would be panels high up or introduced in a deep frieze painted in distemper. We believe pictures can be fixed to the cement surface, and then covered as suggested by glass or enamelled, so as not to harbour dust, and be washable. A bare blank wall surface, even if coloured a nice grey or in quiet tones of green, is monotonous if not relieved by pictures or prints, which appear to be necessary for the eyes of patients of an artistic temperament. The question is one that may well be considered by hygienists and architects engaged in hospital building. Ceilings are suggested to be best painted and non-porous; there are several kinds of paints in the market that may be used; and other appliances, like thin enamelled metal that can be bent easily, have been used. Touching the important question of windows, little definite information is given. The ordinary sash window, with a hopper and spandrel sides to prevent down-draught, is perhaps the simplest mode, and the author thinks that casement windows with solid frames are not open to the objection of angles, crevices, &c., involved in the sash window. At Willesden Parish Infirmary the author has used casement windows brought down to within 12 in. of the floor, and with hopper next the ceiling. The casements open inwards, and form a protection for the bed, and by opening them the wards can be flooded with air. At the Charing-Cross Hospital Mr. Snell is adopting the "Middlesex" windows, which include five sashes of equal size in the height, all of which, excepting the lowest, are hung on centres and controlled by one rod or lever. The sashes close one upon another, and there are no transoms. The lowest sash is hung on the bottom rail. The advantage of this form of window is that it can be opened to a larger extent than the ordinary sash window. All excepting the controlling lever is fixed on the outside of window, and if the glass can be fixed flush with the inner surface of sashes, it is desirable. For doors, hardwood, of course, is adopted, oiled or polished. Enamel paint is also a good substitute. Architects engaged in this class of building are naturally looking for doors without panels, which give a lodgment for dust and dirt. The flush panel doors are a step in the right direction, but the joints open and become crevices for dust. The author then refers to Canadian doors made up of small sections of solid soft wood, very closely fitted together and sheathed with hard wood, dovetailed on the whole, and pressed by hydraulic machinery. A flush-panelled soft-wood door, veneered with thin oak, seems to be all that is desirable, or a thin metal-cased door. In the fittings and furniture of wards the observance of the principles of smoothness, freedom from crevices, and projecting parts is quite as important. The author mentions some improvements in bedside lockers. The tops are now made of glass or marmorite, which is a valuable substitute for glass, and there are no unnecessary joints or crevices, and the whole can be cleaned. As for cupboards, they are certainly objectionable in wards, as they foster concealment of various things. A closed cupboard is used for holding surgical and medical appliances, medicines, &c.; but these should be placed, we certainly agree, not against the wall but in the centre of ward, and the cupboard should be made of hard wood framed and glazed all round, and have glass shelves. Heavy tables and chairs, so charming to the artistic instinct, are shunned by the hospital expert. Stoves are numerous, those made of iron plates and grills and moulded are not recommended; those built up with firebrick and tiles are preferred, as they are cleaner and better radiators. As to the important questions of heating and ventilation, nothing is suggested except that all pipes and fittings should be arranged so as to be easily kept clean; that controlling valves, &c., be kept out of ward; and that all flues, with movable gratings in floors or walls, should be made easy of access for disinfection and cleaning. Mr. Snell refers to the deceptive and objectionable character of many sinks and basins on the market designed for hospitals which are made with glazed surfaces and rounded angles on the top and sides, but are death-traps underneath, full of pockets never likely to be cleaned. In this connection we may refer to some very excellent lavatory basins and fittings for medical and surgical purposes, made by a leading firm of sanitary specialists, we noticed lately, in which all the unseen and underneath parts are scrupulously simple and open for inspection. Fixed lavatories

are now made of materials that are readily cleaned, and with a regard to the sanitary principles we have mentioned. Of course, there is the argument against this extreme view of exacting "openness" of every part of a ward and its fittings. Glass surfaces and partitions, smooth doors and cupboards, the rejection of all angles and mouldings are not conducive to that comfort and artistic sense which patients, as well as healthy persons, are capable of enjoying. Even our scientific principles are likely to be carried to an extreme in these matters of hospital construction and design, and to impair that sense of homeliness and comfort which are essential to health and convalescence.

THE COMPLETION OF TRURO CATHEDRAL.

THE nave and central tower and spire of Truro Cathedral, completing—with the exception of the western towers, the chapterhouse, and cloisters—the late Mr. J. L. Pearson's scheme for the fabric, were opened in the presence of the Prince of Wales on Wednesday. The Diocesan Conference of 1897 decided to lay the foundations of the whole nave and western towers; the first sod was cut by Mr. Nix on May 20, 1898, and the foundations all laid by the end of November in that year. An unknown Cornishman gave £5,000, and other generous contributions brought up the amount to £10,000. In June, 1899, the building operations began. The work proceeded most favourably, the contractors being Messrs. Willcocks, of Wolverhampton, and the clerk of the works Mr. E. Price. The designs of the late Mr. J. L. Pearson, R.A.,* were carried out with absolute fidelity by his son, Mr. Frank L. Pearson. In March, 1901, when a suggestion was made that the memorial to the late Queen Victoria in Cornwall should take the form of the erection of the central tower, Mr. J. Hawke Dennis, formerly of Redruth, now of Grenchurst Park, Surrey, made an offer of £15,000 to finish the tower. An unknown donor has promised stained glass to fill the western windows of the nave, and several of the windows in the aisles of the nave have already been given.

The western portion of Truro Cathedral, now completed, comprises, says Mr. F. L. Pearson, the nave and aisles, with western double porch or narthex, south porch, and western towers. The new work is a completion of the original design, and the same materials have been used as for the eastern portion of the cathedral. The nave is 112 ft. long, 29 ft. wide (the same width as the choir), and 70 ft. high. It is divided into four bays, and these are again sub-divided so that the nave arcades each consist of eight arches. The main piers are circular, with attached shafts and boldly-projecting groin shafts on the nave side; the intermediate piers are elongated, much narrower, and with similar attached shafts. The general lines of the nave follow to some extent those of the choir: they have the same acutely-pointed and richly-moulded arcade arches, bold and very broadly treated triforium, and lofty clerestory with its coupled lancets. The details of the design are, however, much varied, the arches of triforium being filled in with a series of four pointed arches springing from detached shafts and with a large cusped circular opening over them, suggesting incipient rather than developed tracery. The clerestory windows are much wider than those of the choir, but the treatment of the traceried curtain arches is repeated in a varied form. The nave, like the choir, is vaulted in stone, but on a different plan. It is sexpartite, while that of the choir is quadripartite—that is, the vaulted surface in the one case is divided by groin ribs into six, and in the other into four, sections. The broad bays of the nave, 28 ft. wide, intersected by massive transverse ribs, have a very bold and imposing effect as contrasted with the narrower and perhaps more refined treatment of the choir.

The north and south aisles of the nave are 112 ft. long and 14 ft. wide in the clear of the arcade walls, giving a total width of nave and aisles of 62 ft. They are similar in design, and are also vaulted in stone in eight bays, and lighted by a series of lancets, two in each bay, separated by a broad pier, and internally inclosed by a traceried

* The original perspective and ground plan appeared in the *Building News* for May 11, 1883, and reference to these will demonstrate that no material variation has been made in the design since the foundation-stone was laid by the then Prince of Wales, now King Edward VII., three and twenty years ago.

entertain arch after the manner of the nave clerestory, and following in some respects the treatment of the north choir aisle windows. One of the principal entrances to the cathedral is by a south porch, which occupies the westernmost bay of the south aisle; it has but little projection, its dimensions in this direction being circumscribed by the limits of the site. This porch is lofty: it is entered by a bold moulded archway 16ft. high, flanked by square angle pinnacles, and with tiers or niches over it to contain sculpture, some of which is already provided. The doorway is divided by a centre pier, and has elaborate traceried panelwork over it, intended to be enriched with sculpture. An entrance of simpler character occupies a corresponding position on the north side of the cathedral.

The western bay of the cathedral is separated from the nave by a lofty arch, the mouldings of which blend with the nave groining: it is of the width of the nave by 15ft. in depth; it is vaulted in one bay, being, in fact, a continuation of the nave vaulting. Arches north and south rise to a height of 6ft., and give into the western towers; these towers measure 16ft. by 15ft. internally, and are open from floor to vaulting, a height of about 70ft. A western gallery some 20ft. above the floor is erected over the western bay, carried on comparatively low arches, the spandrels of which are enriched with sculpture. This gallery not only provides additional accommodation, but it forms a base to the west end internally, and adds much to its effect. The west end is perhaps one of the most imposing features of the cathedral. Differing from the majority of ancient cathedrals either in this country or abroad, the western doorways are two, not three, or one. They enter directly into the nave through a shallow narthex, vaulted in stone, and not, as is frequently the case, into the aisles through the western towers. These two doorways are of lofty dimensions, and are elaborately treated and recessed under gabled arches, the tympana being filled with sculpture, not, as in so many ancient examples, representing the Doom or kindred subjects, but exhibiting our Lord in his acts of Mercy and Love, and preaching on the Mount and feeding the people in the wilderness.

The west end projects out boldly in front of the two western towers; it is a lofty gable flanked by massive square turrets, the width, including the turrets, being 40ft., and the height to the point of the gable 100ft. The sills of the lowest windows, a pair of coupled lancets, separated by a buttress, 36ft. above the floor, are seen from the inside far above the western gallery. Externally a bold arch springs from the two flanking turrets, rising to a height of 74ft., and inclosing the lancets above described and the rose window over them, which fills almost the entire gable, and consists of seven arched openings clustering round a circular cusped centre, and surrounded by a ring of fourteen quatrefoils, the idea being seven and a multiple of seven. The surface of the gable over its large arc is relieved by diagonal pattern work, interrupted in the spandrels of the arch by panels containing sculpture. A band of nine panels marks the springing of the gable: three of them are pierced for light to the nave roof, the other six contain standing figures of Early Cornish saints already in situ; other panels and a narrow lancet window lead the eye up to the cross on the apex of the gable. The western towers are about 24ft. square, exclusive of the angle buttresses, which have but little projection, but lead up by gentle gradations to the parapets of the tower. A broad western lancet lights the lower stage of each tower; on the second stage are coupled lancets on the two sides which line with the lower lancets of the west gable.

The third stage, not yet erected, will also have coupled windows divided by a centre mullion, and the arches filled with incipient tracery. Above these is the lofty upper stage of the tower, containing very tall windows of two lights with double transoms and interlacing tracery. Being above the nave roof, these windows will be pierced in the four sides of the tower. This stage finishes with a corbel course, enriched cornice, and a pierced parapet; the total height up to this level will be 122ft. The spires will rise to an additional height of 80ft., and have very lofty spire-lights, intersecting the perforated parapet of the tower, and tall hexagonal angle turrets pierced with lancet panelling in two heights. A great feature of the Cathedral externally is the lofty coupled lancets, two in each bay, divided by broad buttresses of but little projection, and its flying buttresses, which mark the divisions of the bays,

springing from massive gabled buttresses which rise high above the aisle walls. The nave roof is a continuation of that of the choir, interrupted only by the central tower, and with a similar covering of slate. The aisle roofs are steep, and are also slated. The floor is paved with marble misciato pavement, and is a continuation of the paving of the crossing.

The central tower is square on plan. Above the roofs it is divided into two unequal stages, all four sides, except for the slight variation in width, being alike. The lower or lantern stage is the smaller of the two, and has three two-light windows deeply recessed in three orders. These windows are visible from the inside of the church and from the lights of the lantern, the vaulted ceiling of which comes immediately above them. The upper or belfry stage also has three two-light windows; but these are of much taller proportions. They are also more deeply recessed, and are filled with oak louvres covered with copper. The heads of these windows are crowned by sharply-pointed gables, which finish under the overhanging corbel course, which comes immediately under the tower parapet. This parapet is richly pierced and traceried, and is divided into three sections corresponding to the windows below by miniature buttresses. The height to the string under the lower parapet is 156ft. The spire rises in simple and unbroken outline from a rich cluster of pinnacles and spire-lights which are grouped round its base. The four angle pinnacles are hexagonal on plan, panelled in two stages, with coupled lancets on each face, and capped with slender spires. They are connected to the central tower by a web of stone, which is gabled and panelled. There is a spire-light in the centre of each of the four cardinal faces of the spire, with tall clustered shafts supporting the traceried head. The total height to the top of the spire is 250ft.

THE SANITARY CONGRESS AT BRADFORD.

THE twenty-first annual congress held under the auspices of the Sanitary Institute took place last week, and was a marked success, both in point of attendance and of the interest manifested in the papers read. The opening address was delivered by the Earl of Stamford, as President, who pointed out that, immense as had been the advancement of scientific knowledge during the past century, we were to-day only standing upon the threshold of those questions which affected the health of the individual; and immense, too, as had been the advance in the social amelioration of the masses, we had only recently entered the field of organised warfare against insanitary conditions. It was a mistake to suppose that mediæval municipalities neglected hygiene; but the imperfection of mediæval sanitary appliances profoundly influenced both religion and economics. He urged that a combination of public and private enterprises should be effected, there being ample room for both methods. But of paramount importance for the cure of the present defects were the education of the country at large, as to its responsibility for the existence of these defects, and the instruction of the working classes themselves as to the necessity of their being provided with healthy homes.

In the conferences that followed Mr. F. E. Fremantle, county medical officer of health for Herts, read a paper on "The Colonisation of Rural England as Foreshadowed by the Garden City Scheme," in which he dealt with Mr. Ebenezer Howard's garden city scheme. Next came a paper on "Cottages for Agricultural Labourers," by Mr. Martin Shaw Briggs, of the Yorkshire Architectural Society. Mr. T. Eustace Hill read a paper on "Suggested Amendments to Part II. of the Housing of the Working Classes Act 1890," and proposed as a resolution the following amendments:—(1) To make the meaning of the word 'owner' the same as in the Public Health Act, 1875; (2) to make the owner of a dwelling-house as to which a closing order has been obtained liable to continuing penalties as long as he permits it to be occupied; (3) to provide that no closing order shall be determined without notice to the council of the administrative county in which the dwelling is situated; (4) to give power to sanitary authorities to make a demolition order as to any building which is dangerous or injurious to the health of its own inhabitants; (5) to give county councils power to enforce the Act in urban districts other than

municipal boroughs; (6) to give an appeal against the dismissal of an application for a closing order." The resolution was carried with an addition—namely, that the council ascertain from other councils what further amendments of the Act were desirable.

In the section devoted to Engineering and Architecture, over which Mr. Maurice Fitz-Maurice, C.M.G., presided, a paper on

A HOSPITAL WARD,

was read by Mr. A. Saxon Snell, F.R.I.B.A., who said that the great principles to be kept in view in the details of a hospital ward are few and simple. Not the least important is the avoidance of all sharp internal angles, deep-out mouldings, and other not easily-cleaned lodgments for dust and dirt. The floor of a ward should be laid on a solid foundation, and the surface should be as impervious as it is possible to make it. Also it should be smooth and free from holes or crevices likely to retain dirt or dust. For this reason no one thinks nowadays of using plain-jointed soft wood floors, because in addition to being absorbent, the material is bound to shrink, and thus leave crevices for the secretion of dirt and dust. Floor sweepings well wetted and impregnated with soap make a horrible compound. Modern floors are of several kinds, which vary according to the fancy of the particular architect or the manager of the building. They comprise the following—viz., hardwood block floors; hardwood tongued boards laid in narrow widths, secret nailed and polished; asphalt; terrazzo; patent composition floors such as Euboelith, &c. The hardwood floors are most frequently made of oak or teak. Hitherto he had himself adopted kiln-dried maple in very narrow widths. In addition to being an exceedingly hard and unwearable floor, its light colour shows up dust much more easily than dark woods. The most useful finishing to wood floors is beeswax and turpentine highly polished. If this is regularly wiped over with a wet rag, and as regularly polished, it is a very good surface; though it is desirable to have the surface entirely cleaned off and renewed at intervals. Terrazzo floors are much advocated on account of their supposed impermeability. Mr. Saxon Snell does not think them quite so impermeable as they are supposed to be. After all, the main part of the material is cement, and it is well known that both cement and marble chips are fairly absorbent materials. Indeed, the comparative impermeability of this floor is due to the high polish it receives when first laid, and that is very soon worn off. These floors are best treated by being polished with beeswax as for wood floors. Even so, they are very hard to the feet, and the mottled colour too easily conceals dirt. Asphalt is, no doubt, the most impervious of floor materials, but it is of a dark, uneven, and bad colour, and is therefore seldom used. The author's experience of patent composition floors has not hitherto been so fortunate as to enable him to commend them highly. They have some undoubted virtues, however, and the material is more impervious, and less subject to the action of acids than any he knows. Unless very carefully laid, they appear to be liable to swell and crack. The material can be coloured, and when polished the surface is excellent. The skirting to the floors should be rounded so as to form a good hollow. The most usual radius is from 2½ in. to 3 in. Latterly Mr. Snell has used 1½ in. only, which is quite sufficient for its purpose, and can be carried round projections more easily than is possible with the larger radius. There are practically two opposite principles which govern the material of which the wall surfaces should be composed, and these are derived from views on that much vexed subject—ventilation. At the present time, for hospital ward walls, at least, impervious walls are mostly in vogue. If we adopt this principle, the next most important consideration is that the surface of the internal faces should be easily cleaned and kept clear and free from dust. The use of tiles gives a more impervious and even surface over a large area, but it is discounted by the numerous joints which no care nor skill in the fixing can make smooth, except in a limited way. The ideal surface would no doubt be an unbroken and polished surface, such as obtains on tiles, affording no ledges for the lodgment of dust; but this has been fairly well achieved by the use of enamel paint upon hard-trowelled cement surfaces. It is scarcely possible to obtain a more generally smooth surface than with trowelled cement—Keene's or Sirapite, for instance. These can be brought to a polished surface. It is difficult, if

not impossible, however, to obtain a really even colour. Ceilings should be non-porous, and are best painted. As to the best form of window for a hospital ward, there appears no general agreement. The most usual is the ordinary sash window, with a hopper above opening into the ward, with spandrel sides to prevent draught. Its form and construction involve, however, the many angles, crevices, and hidden voids which in other parts of the ward we strive so much to avoid. Casement windows with solid frames are at least not open to this objection, though no doubt their advantages in other directions may be questioned. If it is possible to fix the glass of the sashes quite flush with the inner surface of the sashes, a great advance will be made. The doors in a ward should be made wide enough to allow of the passage of a bed, and the upper panels should be glazed with clear glass. For joinery, hardwood throughout is generally adopted, where the question of cost is not vital—hardwood oiled or French-polished. Its comparative freedom from material shrinkage, and its harder or less absorbent surface, are great advantages; but here again enamel paint is not much, if at all, inferior. There are some Canadian doors now made of which the principle of construction could no doubt be applied so as to successfully overcome the difficulty of shrinkage. They are made up of small sections of wood very closely fitted together, and sheathed with hardwood dove-tailed on, and the whole is pressed and almost welded together by hydraulic pressure. At present they are made to imitate the ordinary panelled door, but one is being made for the author now—as an experiment—of solid softwood, sheathed all round in oak. It is in the furniture and fittings of wards, for which the architects are responsible, that there is a general falling away from the principles of construction he was considering, although some very notable improvements have been made in late years in the construction of chairs, tables, and bedside lockers. Cupboards are generally objectionable, and should be as far as possible banished from the ward. One at least is, of course, necessary; but this should not be built against the wall. It should stand out in the centre of the ward, and should be constructed of hardwood, framed and glazed all round and on top, and fitted with glass shelves. Certain ward stoves are excellent for many purposes; but as they are built of iron plates and grills, and plentifully adorned with mouldings, &c., they would appear to be entirely unsuitable to a hospital ward. One or other of the forms of stoves which are built up with plain firebrick and bricks, or tiles, is far preferable. There is a greater amount of heat given out by radiation, and far less by conduction, and there are few lodgments for dust and dirt. Flues of any sort, whether in the floors or walls, should be so constructed, with movable gratings and covers, so as to allow of easy access for cleaning and disinfection. In conclusion, Mr. Saxon Snell urged the necessity for "openness" in every part of a ward and its adjuncts.

PUBLIC BATHS.

Mr. A. Saxon Snell, F.R.I.B.A., also read a paper on the "Influence of Planning and Construction in Baths upon the Cost of Maintenance and Administration." How, and in what direction, he asked, is it possible to economise wisely in respect of the first cost of a building, such as municipal baths? The maintenance and repairs will depend upon soundness of construction and permanence of the surfaces. The working expenses are dependent generally upon good arrangement, but also largely upon the planning of the building. Awkward sites invariably entail straggling and, therefore, uneconomical, plans. The various sections are necessarily so placed that many of them cannot be reached from the entrance except by means of long and wasteful corridors. Every square foot of corridor, &c., may be fairly reckoned as representing 20c.ft. of building, which at a 1s. per foot = 20s. When superfluous space at this price per foot is reckoned by hundreds and thousands of feet, the total is considerable, and worth serious attention as a factor in the cost of such buildings. But that is not the whole cost, for every unnecessary square foot of space involves so much extra expense for maintenance and supervision. As an example of the wastefulness of unsuitable sites, he selected a building planned by himself—the St. Marylebone Baths, where one-third of the space devoted to corridors could have been saved had some adjoining land been purchased, so as to widen the

area. With this he contrasted the plans of his baths at Plaistow and Stratford, where the conditions were less unfavourable. Service corridors are a useless expense. It is preferable to make it impossible for the superintendent to go about the building without passing through one or other of the departments. In the older baths it was no uncommon thing to find four separate entrances for bathers, one for each class of each sex. Nowadays more frequently two entrances only are provided, one for each sex. There is, however, no need for more than one entrance and pay-office, as at a railway station. Waiting-rooms are quite unnecessary adjuncts. Another move in the direction of economy is the abolition of the slipper bath in favour of the spray bath. It occupies just about half the space of the slipper bath, and uses half, or less than half, the water necessary for the former. To this must be added the saving in fuel, &c., in heating the water, and less cost of attendance. A well-appointed and arranged set of spray baths, each with its separate dressing-room, and with common warm and plunge baths, would attract better class bathers in paying numbers. Well-equipped Turkish and Russian baths at a moderate price should also prove paying departments. All the warm baths should be kept as near together as possible and on the same floor level. The boilers and engineering works generally throughout baths should be of the best description, and designed on the most economical lines for the highest efficiency, and by this is meant commercial efficiency, and it is better to reorganise, if necessary, the whole of the engineering plant of an establishment, even at considerable cost, than to waste power and fuel year after year with inferior plant.

THE BACTERIAL TREATMENT OF SEWAGE.

A paper on this subject was read by Professor Henry Robinson, who urged that public money could be usefully expended in experiments directed to determining the best materials and depth for both classes of bacteria beds, the aerobic and the contact classes, also the most effective rates of working. A series of contact beds and of continuous trickling beds worked side by side under similar conditions of flow would give results of the greatest service. If such were carried out, valuable information would be afforded at comparatively small cost for the guidance of those who have to advise as to sewage disposal. The Local Government Board would also have data to assist them in considering the conflicting schemes which now come before them.

HOSPITAL BUILDING AND LIGHTING.

Mr. W. Noble Twelvetrees, of the Institute of Electrical Engineers, showed that even small hospitals could generate electrical energy both for power and light at a less cost than they would have to pay for it to a corporation or company, and that it was cheaper and more wholesome than gas.

CEMENT JOINTS FOR DRAINS AND DRAIN TESTING.

Mr. J. C. D. Armstrong, in a paper on this subject, said the failures of cement joints in stoneware drainpipes are due to one or other of the following causes, viz.:—1. Swelling of the cement in the joint. 2. Uneven expansion of the concrete bed, especially if made of "hot" cement or ground or lias lime, and not of equal thickness, as when deep holes are filled up in the bottom of trench or in large "hand-holes"—the expansion lifts the pipes off their beds. 3. Uneven settlement of the bed—causing deflection of the adjoining joints. 4. Uneven or careless filling-in of the trench, or workmen walking on or knocking the pipes, or by debris falling, &c. 5. Testing or filling-in the trenches before the cement is thoroughly hard. 6. Contraction of the cement in the joints. 7. Failure of the joint to stand the pressure, excepting, of course, the jointing material. Causes 1, 2, and 6 were due entirely to the use of a poor quality of materials or to wrong manipulation, but more failures resulted from cause 4 than any other. The only remedy for causes 4 and 5 was greater carefulness in construction, and notably after inspection. Cause 7 was due either to irregular form of joint or to the sockets and spigots of the pipes being so highly glazed as not to form a proper surface to allow the cement and pipes to thoroughly adhere. The most important part in the joint lies between the end of the spigot and the bottom of the socket. He strongly objected to the use of gaskin joints; the only joint that should be allowed was a rigid cement one.

Mr. C. F. Wike read a paper on

EXPERIMENTS IN SEWAGE TREATMENT AT SHEFFIELD, in which he described tests with open septic tanks and with contact beds. The results indicate that the sewage of Sheffield can be purified satisfactorily by the simple settlement of the sewage in tanks, and by subsequent treatment in double contact beds. In the case of settled sewage greater purification has been obtained than by the open septic tank process, although both systems have given effluents which are non-putrescible, and conform to any reasonable standard of purity for sewage effluents. The great advantage which it was anticipated would result from the action of the open septic tank in facilitating further purification has not been realised, nor apparently does the system present a solution of the sludge difficulty. As the proportion of sludge destroyed is only about 30 per cent., and probably less, it is a question for serious consideration whether the large tank area required, the liability to nuisance, and the difficulty in dealing with sludge in bulk, are compensated for by the destruction of so small an amount of sludge.

THE INTERNATIONAL FIRE PREVENTION CONGRESS.

THE concluding meetings of the International Fire Prevention Congress, convened by the British Fire Prevention Committee, and reported in our last issue pp. 37-8, were held on Thursday in last week at Caxton Hall, Westminster. The day's proceedings began with the sectional meetings, which were followed by a general meeting, over which Mr. Edwin O. Sachs (chairman of the British Fire Prevention Committee) presided.

ELECTRICAL SAFEGUARDS.

In the section dealing with "Electrical Safeguards and Fire Alarms," papers were contributed by Mr. E. C. de Segundo on "Electric Wiring and Fire Risks," and by Mr. Alfred Hands on "Necessary Practical Safeguards against Lightning."

Mr. E. C. de Segundo said in the course of his paper that the essential condition of a properly-erected wiring installation consisted in providing that the electric current should be kept within its prescribed bounds, and that if by any unforeseen contingency a way should be opened for the current to travel in an unauthorised direction the supply should be cut off automatically and instantly. No absolutely trustworthy means has as yet been devised whereby possible trouble due to electricity "out of bounds" could be guarded against, and the efforts of those who were working in the cause of fire prevention should be directed towards bringing about the adoption of the best kind of insulation and the most suitable kind of mechanical protection for the wires. For safety against risk of fire one must, he remarked, depend entirely upon the means adopted for keeping the electric current within its designed sphere of action—namely, the character of the insulation of the wires or the means adopted to prevent contact between wires of opposite polarity. This included the insulation on the wire and the means adopted to guard against mechanical injury and damp. Up to the present nothing had been found to touch best quality rubber specially prepared to resist the oxidising action of the atmosphere, and the deleterious influence of any rise in temperature of the conductor. It was possible, however, that before long a new form of insulator might be introduced upon the English market which, while possessing all the useful properties of guttapercha, was practically indifferent to the action of light and air, and was very much harder than guttapercha. Large quantities of wires insulated with this material had already been used on the Continent with excellent results. The ideal method of wiring a building, in his opinion, was to use nothing but the highest class of vulcanised or other suitable rubber insulation with some suitable form of mechanical protection in the way of briding, and to inclose the wires in a continuous system of cold-drawn steel tubes specially selected for smoothness of bore, with joint boxes inserted at all points necessary to enable the drawing in of the wires to be carried out without injury to their protective covering, and to facilitate inspection, withdrawal of any wires for the purpose, if need be, of increasing their size, &c., the whole system of steel tube and joint boxes being connected to earth.

Mr. Hands stated in his paper on "Necessary

Practical Safeguards against Fires caused by Lightning—thunderstorms were gradually increasing over the whole of civilised Europe, and in the course of 60 years the average number of such storms in London had increased from 12 to 22 per annum. Considering the number of lightning discharges in these storms, it appeared evident that damage would be very much more frequent if it were not for the lightning conductors in use. Conductors, however, were not always successful. There was a tendency to regard protection from lightning too much as being the mere putting up of lightning conductors. True protection from lightning often consisted of a good deal more than the mere erection of conductors. The part that often made the difference between efficiency and non-efficiency was the making of various connections to bridge over sparking gaps, as well as keeping a safe distance away from metals that it would be dangerous to connect to. For general purposes the system to be adopted was an intelligent consideration of the conditions that might exist in the structure to be protected.

The principal resolutions which were passed by the Congress at its final meeting were as follows:—That the term "fire-resisting" be adopted in place of "fireproof," as being the more applicable for general use; that the standards of fire-resistance shall be (1) the temporary protective class, (2) the partially protective class; and (3) the fully protective class; that testing stations for fire-resisting materials be established, and a universal method of testing be adopted; that courses of study be provided in universities, technical colleges, and schools for the instruction of engineering and architectural students in the fire-resistance of building materials and the methods of construction as based on investigation; and that in all cases of fire an official inquiry shall follow.

PRACTICAL SCIENCE FOR PLUMBERS, ENGINEERS, AND STUDENTS.

A SERIES of Short Chapters on Physics, Metals, Hydraulics, Heat, and Temperature, as applied to Problems of Practical Work, has been published by Mr. B. T. Batford, from the pen of Mr. J. Wright Clarke, Lecturer on Plumbing at the Polytechnic, Regent-street, and the volume has the advantage of being illustrated by diagrams. This is the kind of handbook which serves to amplify the classwork of a technical school, and, in the face of foreign competition, it is essential that the plumber in particular, and the workman generally, should be induced to become acquainted with the sciences associated with their craft. The students who attend scientific classes of this kind are limited, and teaching of this nature, in any case, ought to be supplemented by reading, particularly when the attendances are intermittent, and the course of lectures are broken into from one cause or another. The work before us appears to be eminently adapted to its purpose. The cases are clearly stated, and the problems are graphically described and explained, though in some cases the details of the diagrams might have been larger perhaps with advantage. The price of the book is five shillings net.

Alterations and additions are about to be made to the Royal Air Hospital in Dean-street, Soho, from plans by Mr. A. O. Collard.

Herr Bernhard Hertel has been appointed by the Prussian Government architect to the Cologne Cathedral. He is a well-known authority on Gothic architecture.

Lord Rosebery opened, on Wednesday, three pavilions in extensions of the Victoria Hospital for the open-air treatment of consumption, at Craigleith, near Edinburgh.

Princess Louise, Duchess of Argyll, unveiled, on Friday, a bust of the late Sir Arthur Sullivan which, with the permission of the London County Council, has been placed in the Thames Embankment Gardens, immediately in front of the Savoy Theatre, and a little east of the Robert Rukes statue. The bust, which is the work of Mr. W. Goscombe John, A.R.A., is erected on a stone pillar, against the front of which a bronze figure representing "Grief" is resting, and on one side of a stone slab which supports the memorial are several instruments, the mask of comedy, and a book of music, all worked in bronze. The name of the composer and the dates 1842 and 1900 are carved in a piece of stone attached to the base of the memorial, while on one side of the column on which the bust stands are lines by Mr. W. S. Gilbert.

OBITUARY.

Mr. THOMAS D. EVANS, one of the best-known architects in Western Pennsylvania, died at the hospital in Pittsburgh a fortnight ago from a paralytic shock. Mr. Evans was a Welshman by birth, but had lived in the United States since his childhood. He served in a Pennsylvania cavalry regiment throughout the Civil War, suffering a severe wound, for which he was treated in the same hospital in which he died forty years later. After the war, he studied architecture with the firm of Barr and Moser; and, in 1871, began practice on his own account. He designed many of the principal buildings in and about Pittsburgh, and was, at the same time, highly esteemed by his professional associates. He was for some time President of the Pittsburgh Chapter of the American Institute of Architects.

CHIPS.

The parish church of Greatham has been reopened by the Bishop of Lincoln, after being restored at a cost of about £1,500. The work has been carried out by Messrs. Bowman and Sons, of Stamford, the architect being Mr. C. Hodgson Fowler, of Durham. A carved pulpit has been presented by a parishioner.

The new premises of the Royal Dockyard Orphanage in Milehouse-road, Plymouth, were formally opened on Saturday. The new building was designed by Mr. H. J. Snell, and was erected by Mr. S. Roberts. Hitherto the accommodation in the home has been for 22 children; the new premises will provide for 56. On the ground floor there are dining-rooms, a board-room, and reception-room, together with kitchen, scullery, &c. The first floor is devoted to dormitories for girls, together with bathrooms, wardrobe-rooms, and lavatories, and the second floor is reserved for the boys. There are also rooms for the master and matron, and an isolation room.

A new hospital for European women is about to be built at Bombay from plans by Mr. John Begg, consulting architect to the Government. It will accommodate 60 patients.

The Tanat Valley Light Railway in Salop and Montgomeryshire is approaching completion, all the bridges, culverts, and waterways being finished. It will be opened in September. Mr. Collin is the engineer, and Mr. Strachan the contractor. The line runs from Oswestry to Porthwyman and Llangynog, and has cost about £60,000.

The designs for the dedicatory plates in connection with the 7th Dragoon Guards South African Memorial in Norwich Cathedral have now been approved by the officers of the regiment in South Africa. They will be executed by Mr. Harold East, of the Upper Market, Norwich. The memorial itself will be a stained-glass window, the work of a London firm, and this will fill the second opening on the east side of the north transept. Beneath this will be placed the two dedicatory brasses.

Memorial stones of a new Wesleyan chapel at Brenty were laid last week. The structure is of red brick with Bath-stone dressings. It will accommodate about a hundred people. The architect is Mr. John Young, and the builder is Mr. W. Harris, of Westbury-on-Trym.

Two new schools are being built for Erdington, by the Aston School Board, one, of a higher grade character, to be erected in Fentham-road, Erdington, and the other in Slade-road. Building operations have already commenced. The school in Slade-road, which will be the larger of the two buildings, will cost over £9,000, and will consist of two blocks. Accommodation will be provided for about 650 children. There will be provision for cookery classes. The architect is Mr. Jenkins, of Bennett's Hill. At Fentham-road at present an infants' block only will be constructed, affording accommodation for 400 children in seven classrooms. When completed the building will be used as a higher grade school for 300 boys and 300 girls. This school will be erected to the designs of Messrs. Cossins, Peacock, and Bewlay, Colmore-row. The contract of the builders for the present building amounts to £5,997.

The Hexham Rural District Council have adopted a scheme of water supply for Haydon Bridge prepared by Mr. Harry W. Taylor, A.M.I.C.E., of Newcastle-on-Tyne and Birmingham, and estimated to cost £5,000.

The partnership hitherto subsisting between E. A. Swane and H. W. Ayles, architects and surveyors, Newport and Freshwater, Isle of Wight, under the style of Swane and Ayles, has been dissolved; as has also that between E. Stiff, S. J. Stiff, J. A. Stiff, and W. F. Stiff, stonemasons and terracotta manufacturers, London Pottery, Lambeth, S.E., under the style of James Stiff and Sons, so far as regards E. Stiff.

PROFESSIONAL AND TRADE SOCIETIES.

INSTITUTE OF SANITARY ENGINEERS.—The provincial summer meeting of the members of the Institute of Sanitary Engineers was held on Tuesday in the town-hall, Wolverhampton, when a cordial welcome was extended to them by the mayor of the borough, Alderman Thorne, the chairman of the Corporation Health Committee. The president, Mr. W. J. Dibdin, delivered an address on "The Theory and Practice of Filtration." A discussion followed. After luncheon the members proceeded to inspect Messrs. Hamblet's Blue Brick Works at West Bromwich. The meetings were continued on Wednesday and Thursday.

NATIONAL FEDERATION OF BUILDING TRADE EMPLOYERS.—The secretary of the National Federation of Building Trade Employers of Great Britain and Ireland has issued the programme for the half-yearly meetings to be held at Cardiff on Tuesday, Wednesday, and Thursday in next week. On Tuesday the visitors will receive an official welcome from the Mayor of Cardiff at the South Wales Institute of Engineers, and a meeting of the council will follow at the same place, after which there will be a luncheon at the Royal Hotel, by invitation of the Cardiff Master Builders' Association. A visit will be paid in the afternoon to the new Law Courts, where members will be received by the Mayor (Alderman Thomas), the chairman of the building committee (Alderman Carey), the architects (Messrs. Lanchester, Stewart, and Richards), and the contractors (Messrs. E. Turner and Sons). A banquet at the Royal Hotel will conclude the first day's programme. The general meeting is fixed for Wednesday morning. The afternoon will be devoted to visits to the docks and the new dock works, and to Messrs. Guest, Keen, and Nettlefold's works, and in the evening there will be a reception in the town hall by the Mayor and Mayoress of Cardiff. On Thursday there is to be an excursion to Ilfracombe per steamer *Cambria*.

ROYAL INSTITUTE OF PUBLIC HEALTH.—The annual congress of this institute was opened on Wednesday night in St. George's Hall, Liverpool. Professor W. R. Smith, president of the institute, asked the Earl of Derby to accept the honorary Fellowship of the institute, and invested him with the badge of office as president of the congress. Harben medals of 1901 and 1902 were presented to Sir Charles Cameron and Professor W. R. Smith. Lord Derby afterwards delivered his presidential address, in which he dealt with the progress made in sanitation and the precautions that were now taken for protecting the public health.

WILTSHIRE ARCHEOLOGICAL SOCIETY.—This society opened its jubilee meeting on Wednesday in Devizes, the town where it originated in a meeting held under the presidency of the then Lord Lansdowne on October 12, 1853. The Marquis of Bath this year begins a presidential term (three years), but owing to a family bereavement he was unable to attend, and the business meeting on Wednesday was presided over by Mr. N. H. Story-Maskelyne. The report recorded a membership of 365, and announced the resignation of Mr. H. G. Medlicott as general secretary, a post he has held for many years. Mr. E. O. Pleydell-Bouverie was elected in Mr. Medlicott's place. A detailed description was given of a Roman villa excavated at Box, a village near Bath, which has been undertaken since the last meeting of the society at the sole cost of a member—Mr. W. Heward Bell. The existence of the villa has been known for many years, and fragments of it were unearthed in 1831, but only now have the investigations been anything like exhaustive, and even so they are not complete. The size of the ground plan of the villa has been approximately fixed at 174ft. from east to west and 216ft. from north to south. Some of the hypocausts, pavements, and walls are in good condition.

Messrs. E. H. Shorland and Brother, of Manchester, have just supplied a number of their patent Manchester grates to the New Naval Barracks, Portsmouth.

At St. Mary's Hall, Coventry, on Friday, Colonel W. Langton Coke, on behalf of the Local Government Board, held an inquiry into the application of the Coventry Corporation for sanction to borrow £1,000 for works of drainage on their Baginton sewage farm, and £2,619 for the redemption of the tithe rent charge on such farm.

ROYAL HOSPITAL FOR CHILDREN AND WOMEN, WATERLOO-ROAD, S.E.—BLUE COAT SCHOOL, LIVERPOOL.—LIVERPOOL CATHEDRAL: DESIGN BY C. A. NICHOLSON.—"COLDHARBOUR," SURREY.—NEW LODGE AT FORTY HILL, ENFIELD.—PROPOSED PUBLIC LIBRARY, FENTON.—THE GATEHOUSE, STANWAY HALL, GLO.—A MODERN GERMAN SITTING ROOM.

Our Illustrations.

THE ROYAL HOSPITAL FOR CHILDREN AND WOMEN, WATERLOO ROAD, S.E.

This Hospital is situated at the corner of Waterloo-road and Stamford-street, almost opposite Waterloo Station. It is being rebuilt as a memorial to the late Queen Victoria (who was a patron and governor) in two sections. The first portion in Waterloo-road, now in course of construction, will provide for about 100 beds, and an extensive outpatients' department. The front will be faced with red brick and Doulton's buff terracotta. The contract for the section now in progress is £30,000. Messrs. Holliday and Greenwood are the contractors. The architects are Messrs. Waring and Nicholson, of Parliament-street, Westminster.

BLUE COAT HOSPITAL, LIVERPOOL: MEMORIAL CHAPEL.

This drawing hangs now at the Royal Academy Exhibition with the exterior view which we illustrated on June 26 last, when we published a description of the new buildings, of which Messrs. Briggs and Wolstenholme are joint architects with Messrs. Hobbs and Thornely, of Liverpool. We gave a plan with our previous plate of this chapel.

LIVERPOOL CATHEDRAL.

THE "West front" facing Upper Duke-street, which we print to-day is one of the best features in Mr. Nicholson's design, of which we illustrated the main side elevation and plan on June 5. We gave his longitudinal section on June 26. The plate now published shows the detail of the principal portal to a large size not before published.

"COLDHARBOUR," SURREY.

The drawing of this house is self-explanatory, and the small plan reproduced gives the arrangement of the rooms. The site is a hillside one, sloping down from the road, and the garden will be arranged in terraces. On the first floor are four bedrooms, two dressing-rooms, bath-room, lavatory, and linen-room, and the attic floor provides three bedrooms, servants' dormitory, box-room, and cistern-room. The materials are roughcast with stone dressings, and the roof covered with hand-made tiles. Mr. W. E. Brooks, A.R.I.B.A., is the architect.

FORTY HILL LODGE.

This Lodge is to replace an old building situate near the entrance gates to Forty Hill, Enfield. The rooms are arranged with a south aspect, the living-room overlooking the entrance-gates to drive. Externally the walls are to be finished roughcast. The timber-work is to be carried out in oak, and the roof covered with hand-made tiles. Mr. Sydney W. Cranfield is the architect,

and the drawing was exhibited at the Royal Academy with others which we illustrated on May 8 last.

FENTON LIBRARY: FIRST PREMIATED DESIGN.

This library design was chosen in the late competition with eighty-nine competitors, and awarded the first premium by Mr. Ernest George, the assessor. It is proposed to be built of red bricks, and the roof of green Westmoreland slates in diminishing courses from eaves to ridge, with cast lead ridges and hips, and white painted woodwork. Messrs. Charles F. Short and Arthur J. Penty are the joint architects. The building, when built, will be a "Carnegie Library." We shall illustrate the second premiated design shortly.

THE GATEHOUSE, STANWAY HALL, GLOUCESTERSHIRE.

We publish a sheet of measured details of the street front of the Gatehouse at Stanway Park, Gloucestershire. In our issue of August 9, 1895, we published a double-page drawing, by Mr. Maurice B. Adams, of the courtyard elevation of this building, and sketches of the doorway from courtyard to churchyard, together with a small-scale ground plan of courtyard, and accompanying these illustrations an historical sketch of the buildings and house generally, in connection with the A.A. visit on the annual excursion that year. The street front we did not illustrate, and, so far as we are aware, no measured drawing has yet been published of this front. Our present illustration is drawn by Mr. T. Overbury, of Cheltenham.

A MODERN GERMAN SITTING ROOM.

This group of furniture is notable chiefly for its novelty, and in its execution there is nothing to be desired. As to whether it represents a type of design suitable for execution in wood remains a matter, no doubt, upon which tastes will differ. Anyway, it has the merit of all being in keeping one piece with the other, and, besides, it represents a style very much the fashion among the arts and crafts community in Germany just now. The author of these designs is Professor Jan. Kotěra, of Prague, who has founded quite a school of workers who follow his lead.

The Countess of Carrington laid the memorial-stone of the Passmore Edwards Polytechnic at Camberwell yesterday. The architect is Mr. Maurice B. Adams, F.R.I.B.A.

The Bradford City Council settled on Tuesday the vexed question of the much-needed extension of the town-hall by adopting a scheme which provides that there shall be no external alteration to the existing building, but that the thoroughfare in the rear of it shall be closed, and that the space occupied by the old building adjacent shall be utilised for the extension. The plans will provide for the addition of another story to the existing building, should that be considered at any time necessary. The estimated cost of the scheme is £65,000.

Mr. E. A. Sandford Fawcett, A.M.I.C.E., a Local Government Board inspector, has held an inquiry at the Market Hall, Midsomer Norton, into an application of the Midsomer Norton Council for permission to borrow £1,200 for works of water supply to be constructed in the parish of Chilcompton, and also for borrowing £1,850 for purchasing the Market Hall, Midsomer Norton, and for adapting the same for the purposes of public offices.

Princess Henry of Battenberg on Wednesday laid the memorial-stone of a soldiers' and sailors' institute which is being erected at Devouport. The building is to comprise recreation-rooms, coffee hall, and bar, with sleeping accommodation arranged partly as cubicles on the Rowton-house principle and partly as dormitories. There is also accommodation for the families of married soldiers and sailors, including sitting and bed rooms. The design of the building is of a Queen Anne character. The architect is Mr. C. R. Kitsur, and the builder Mr. W. E. Blake.

The East Riding Antiquarian Society visited on Monday Wetwang and Fridaythorpe, and inspected the churches at those places, which have recently been restored by Sir Tatton Sykes, and the British intrenchments between Fridaythorpe and Fimber, the Rev. E. Maule Cole, vicar of Wetwang, acting as guide and describing the places visited.

The death took place at South Hylton, on Monday, of Mr. Matthew Gibbons, timber merchant. The deceased gentleman was chairman of the Hylton Parish Council, and formerly chairman of the Hylton School Board. Mr. Gibbons was in his fifty-fifth year, and leaves a widow, four daughters, and a son.

COMPETITIONS.

BLACKPOOL.—In announcing the award for the Blackpool Technical School Competition, p. 43 last week, we published the names of the successful architects as Potts, Son, and Pickup, as given in the local newspapers. The name of the firm for some years now has been Potts, Son, and Hennings, of Manchester, Bolton, and London.

COLWYN BAY.—In a competition for the best set of designs for a block of first-class business premises at the corner of Penrhyn and Conway-roads, Colwyn Bay, the first premium has been awarded to Mr. E. A. Lloyd, Blackburn, and the second to Mr. D. M. Roberts, Colwyn Bay.

HAMILTON, N.B.—At a meeting of the parish council it was reported that, of eighteen plans sent in for the laying-out of the new cemetery, Mr. Alex. Cullen, architect, had adjudicated as follows:—(1) "Confide," John B. Brodie, C.E., 136, Wellington-street, Glasgow; (2) "Eventide," John Cowan, C.E., 179, West Regent-street, Glasgow; (3) "Experience," A. and R. McCulloch, C.E., 25, Gayfield-square, Edinburgh.

LEITH.—The parish council at their meeting on Monday considered the recommendation of the building committee that plan 6 of the proposed new poorhouse, No. 2 scheme (brick), subject to such modification as might be determined, be adopted. Approval of the minute having been moved, Mr. Johnson submitted an amendment that before deciding on any plan, an expert be asked to advise the council. No two architects were offering the same thing, and therefore he thought it would be foolish on the part of the council to decide without taking expert evidence. The architect's estimate of the building in stone according to one plan was £94,939, and the measurer's £92,939. Plan No. 6 was estimated by the architect to cost £14,000, the measurer said £68,784. On a division the recommendation was approved by eleven votes to six after considerable discussion. The name of the author of the selected design did not transpire.

SUNDERLAND.—At the last meeting of the town council it was agreed, on the recommendation of the Town Hall Committee, that Mr. John Eltringham, of Sunderland, author of the first premiated design for the proposed additions and alterations to the Victoria Hall, should be appointed architect for same.

The Education Committee of Southampton has been recommended by one of the sub-committees to appoint Mr. Crowther, the borough engineer, as architect and surveyor to the local education authority.

At Milderton church a new memorial chancel screen, erected by Messrs. Harry Hems and Sons, of Exeter, was dedicated on Thursday in last week. It is Perpendicular in style, and was constructed in English oak.

The building boom which has been in existence in Partick during the past year still continues, and at the local Dean of Guild Court on Friday plans of buildings, valued at close upon £10,000 were passed.

Considerable opposition is being raised by the Historical Records Committee of the London County Council, by the City Corporation, and others interested in preserving ancient landmarks in London, to the proposal of the borough council of Southwark to demolish the well-known obelisk of Portland stone in St. George's-circus, erected in 1771, as a memorial to Alderman Brass Crosby, the man who contended for and secured a free Press, by obtaining the release of a printer imprisoned for publishing the Parliamentary debates, and to substitute for it a clock tower of meagre proportions, offered by a firm of wholesale tobaccoists.

A bronze-coloured facsimile of Stevens's plaster model of the equestrian figure for the Wellington monument, with certain missing parts supplied by Mr. John Tweed, from Stevens's sketch model, has now been placed in position in St. Paul's Cathedral, and will be open to public view, by permission of the Dean and Chapter, until Monday evening next. The appearance of the equestrian group, as seen from south-east or south-west, from the space under the dome, or from the nave, is very effective, and obviously completes the outline of the monument. The pedestal on which the horse stands projects, however, a trifle too far, and might well be slightly reduced in area.

The British Archaeological Association during their forthcoming visit to Sheffield will visit Beauchief Hall, Dronfield and Chesterfield, Work-sop Priory Church, Ecclefield Priory House, Rotherham Church and Bridge Chapel, with Roche Abbey, and Carbrook Hall and Winobank Hill.

The Calthouse, Stanway Hall, Glou.

Detail of Elevation towards Road.

Note. The whole of front is executed in stone with an ashlar face, & is largely covered with vegetable matter so that the jointing is very indistinct.

The panels of doors are richly carved with strapwork ornament etc. & the framing of door is shrouded with large nail heads.

Engineering Notes.

YALDING.—The new stone bridge, built by the Kent County Council over the Medway in Hampstead-lane, near to the railway station, was opened on Wednesday week. The new bridge replaces an old and inadequate wooden structure, much inferior to the temporary bridge in service during the course of construction. It is of Kentish ragstone, with railed approaches of iron tubing, and a parapet wall of ragstone. The approaches extend some 200ft. on either side, and have a gradient of 1 in 20. The bridge itself is of steel girders, with Hobson's patent flooring, both girders and flooring having been supplied and fixed by the Cleveland Bridge and Engineering Company, of Darlington. There is a clear roadway of 16ft. 6in. and a 4ft. path. The bridge crosses the river almost at an angle of 45°, and allows barges 9ft. 6in. head room, and a waterway of 21ft. In addition, there are five land arches, 10ft. in breadth, for the accommodation, in flood time, of the extra water. The bridge has been erected by Messrs. Wallis and Sons, of Maidstone to plans and specifications prepared by Mr. F. W. Ruck, the county surveyor, and the contract price was £4,150, the total cost being £4,400.

Building Intelligence.

BUILT WELL.—Alpha Presbyterian Church has just been completed at a cost of £1,500. The new building occupies the site of the old chapel and adjoining cottages, as well as land at the side and in front. The style is Perpendicular Gothic, and the walls have been built of local blue stone with freestone dressings. The side elevation, facing the picturesque river Wye, is broken up with gables and a square-pinnacled tower which, rising to a height of 70ft., is surmounted by a flagstaff. The main entrance is in the west elevation, above which is a window with tracery work, surmounted by a gable. To suit the contour of the adjoining road the western end of the structure has been shaped octagonally, the sides being terminated with a panellled parapet. The church has an open-timber roof with a pitchpine beaded ceiling and arceding on each side, supported by narrow octagonal columns. The side and end galleries are provided with panellled fronts, and the choir-gallery and organ-chamber are erected behind the rostrum. The total length is 76ft., with a width of 43ft. across the transepts. The school premises are situated at the east end of the building, and comprises a lecture-hall and nine classrooms, with scullery and lavatory accommodation. Mr. D. W. Richards, Newport (Mon.), was the contractor, and Messrs. Habershon, Fawcner, and Groves, Newport and Cardiff, were the architects.

SHOTESHAM.—Over three years ago the parish church of Shotesham All Saints underwent restoration, and no sooner was this completed, at a cost of £3,000, than the vicar turned his attention to raising funds for restoration work at Shotesham St. Mary. This has now also been completed, and the church was reopened last week. The plaster ceiling has been removed and a boarded one substituted, and the church retiled. Defects in the walls—cracked from top to bottom by ivy—have been made good. The walls have been coloured, and the seats stained and varnished. The old north doorway, blocked up with rubble, has been opened out, as have also an old doorway and two windows which were discovered in the transept. Some small fragments of painted glass, for which the church was famous in pre-Reformation times, have been discovered and placed in the window in the north transept. The roof of the tower has been re-leaded, and the old font removed and set up between the north and south doors. The two-manual organ has been improved, and St. Mary's contains a reredos of white Caen stone, erected a few years since, and is a copy of Da Vinci's "Last Supper" in Milan. The work of restoration has been carried out by Mr. Greengrass, of Shotesham.

The unveiling of the busts of Emerson and James Martineau at the Passmore Edwards settlement, Tavistock-place, by Mr. Joseph Choate, the American Ambassador, and Mrs. Humphry Ward took place on Wednesday afternoon. Mr. George J. Frampton, R.A., was the sculptor.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the BUILDING NEWS, Clement's House, Clement's Inn Passage, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to THE STRAND NEWSPAPER COMPANY, LIMITED.

Telephone No. 1633 Holborn.

NOTICE.

Bound copies of Vol. LXXXIII. are now ready, and should be ordered early (price 12s. each, by post 12s. 10d.), as only a limited number are done up. A few bound volumes of Vols. XXXIX., XL., XLVI., XLVII., XLVIII., XLIX., L., LXI., LXII., LXIII., LXIV., LXV., LXVI., LXVII., LXVIII., LXIX., LXX., LXXI., LXXII., LXXIII., LXXIV., LXXV., LXXVI., LXXVII., LXXIX., LXXX., LXXXI., and LXXXII. may still be obtained at the same price; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

Handsome Cloth Cases for Binding the BUILDING NEWS, price 2s., post free 2s. 4d., can be obtained from any Newsagent, or from the Publisher, Clement's House, Clement's Inn Passage, Strand, London, W.C.

TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 6d. (or 6dols. 30c. gold). To France or Belgium, £1 6s. 6d. (or 33fr. 30c.). To India, £1 6s. 6d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 6d.

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of eight words, the first line counting as two, the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Situations and Partnerships.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" and "Partnerships" is ONE SHILLING FOR TWENTY-FOUR WORDS, and Sixpence for every eight words after. All Situation Advertisements must be prepaid.

* Replies to advertisements can be received at the office, Clement's House, Clement's Inn-passage, Strand W.C., free of charge. If to be forwarded under cover to advertiser an extra charge of Sixpence is made. (See Notice at head of "Situations.")

Rates for Trade Advertisements on front page, and special and other positions, can be obtained on application to the Publisher.

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page Advertisements and alterations in serial advertisements must reach the office by Tuesday morning to secure insertion.

RECEIVED.—M. J.—O. L. J.—I. N. and Son.—L. F. W. D. M. (Bristol).—L. and Son.—E. F.

TINTERN ABBEY. (A beautifully-executed measured drawing in longitudinal section of the nave of this Cistercian church, by the late Edmund Sharpe, appeared in the BUILDING NEWS for April 20, 1877. If, as you say, you have all the back volumes in stock, it will be worth your while to look it up and study it before visiting the valley of the Wye. The number has long been out of print.)—P. M. J. (In the BUILDING NEWS for June 15, 1887, is an internal view of the former nave of St. Savin's, Southwark, destroyed in 1530, drawn by F. T. Dollman, with a conjectural restoration of the groined roof which fell in 1469; Mr. Dollman's drawing, which was hung in the Royal Academy in 1877 and attracted considerable attention, was based on reliable data. Measured drawings of the choir and transepts, by G. E. S. Langford, were given in our issue of Jan. 25 and March 5, 1878, and others of Lady chapel by F. H. Tulloch, in our issue of Dec. 12, 1881. See also the more recent illustrations of the late Sir Arthur W. Blomfield's new nave, Feb. 19, March 19, and April 16, 1897.)

"BUILDING NEWS" DESIGNING CLUB.

DRAWINGS RECEIVED.—"James," "D'Artagnan."

The first section of the electric tramways for Lowestoft, that from Belle Vue Park, North Lowestoft, to the northern boundary of the borough at Pakefield, has been completed, and will be formally opened to-morrow (Saturday). Work on the other section of the undertaking will not be commenced till after the visitors' season has ended.

Intercommunication.

REPLIES.

[11988.]—**Australia.**—Writing from 15 years' experience, ending 1896, your chances would be confined to Melbourne or Sydney, first; Adelaide or Brisbane, second (the latter cities hot climates). Other towns of size few. See populations, public buildings, schools, railways, &c., all Government departments, and "interest" required. Local candidates many, and, naturally obtaining the preference. Salaries outside not much above those paid in England. Ability and push required, and a twelve-months' residence, including travelling from city to city, would be necessary.—A. C. LEE, Maidenhead.

[11991.]—**Dry Rot.**—Probably "Architect" was near the truth, as dry rot rapidly increases in hot weather. Bacteria being out in their millions, and very busy everywhere. Have you proper ventilation all round below floor, by inserting iron or vitrified clay air-bricks in the wall, and above ground an inch or two? Well soak the wood with corrosive sublimate solution (cold), or a hot solution of Peters, Birtsch, and Co., Derby, Carbolicum Aveanum preparation. Wood-block flooring laid on concrete on iron joists would be a good flooring.—REGENT'S PARK.

[11991.]—**Dry Rot.**—Evidently the floor of workshop and office is in a very wet position. Thoroughly drain building and well ventilate underneath floor, as nothing will eradicate dry rot better than plenty of fresh air. If this is impossible, and as a wood floor is a necessity, I would suggest concrete and wood block laid in bitumen.—J. ASHLEY.

[11992.]—**Valuations for Probate.**—Valuation for probate: 2 per cent. on first £500 and 1½ on the excess, and out-of-pocket expenses. But it is now usual to make a bargain for a fixed and moderate sum. Valuation of land: Sixpence per acre, and out-of-pocket expenses. No fee less than five guineas. Cropping: 5 per cent. up to £100 and 2½ per cent. on the excess, and out-of-pocket expenses. Timber valuation: 5 per cent. on first £100 and 2½ on the excess, and out-of-pocket expenses. Valuation to fix rent: 5 per cent. on first £300 and 2½ on remainder of one year's rental value, and expenses. Surveyor's fees (auctioneers' and estate agents' scale): Valuation for probate or administration (under the Finance Act, 1894) of furniture and effects: 2½ per cent. up to £500, and 1 per cent. beyond that amount.—REGENT'S PARK.

CHIPS.

Lord Claud Hamilton, Chairman of the Great Eastern Railway Company, on Saturday opened the clubhouse, erected at Lowestoft by the Royal Norfolk and Suffolk Yacht Club. The clubhouse has cost about £5,000.

The old hall at South Piekenham, midway between Swaffham and Watton, Norfolk, a Neo-Greek building with cemented fronts, standing in an extensive park, having been purchased from the Applewhite family by Mr. Charles Taylor, has been demolished, and on its site a mansion of red brick and Queen Anne in style, is being erected from plans by Mr. R. W. Schultz. More than 100 men, in the employ of Messrs. Mussellwhite and Co., builders, of Basingstoke, have been at work on the new hall for the past year, and another ten months will elapse before it is ready for occupation. New cottages are also being built on the estate.

Colonel R. A. Dureford, R.E., Local Government Board inspector, held an inquiry on Friday at the town-hall, Gorton, into an application by the Gorton Urban District Council for sanction to borrow £8,816 for the provision of a refuse destructor on a site adjoining the Gorton outfall sewage works.

A Select Committee of the House of Lords passed on Monday the Local Government Provisional Order (No. 5) Bill. The object of the Bill is to confirm provisional orders granted by the Local Government Board to the boroughs of Hampstead, Holborn, and Lambeth, authorising the compulsory acquisition of land for the erection or extension of municipal offices. The London County Council appeared in opposition to the order to obtain the insertion of a clause preserving the operation of the Metropolitan Management Acts and the London Building Acts, but the committee decided not to insert the clause.

Sir Lawrence Alma-Tadema, R.A., unveiled on Monday a memorial to the late Mr. Edward Onslow Ford, R.A., erected at the junction of Abbey-road and Grove-end-road, St. John's Wood, within a few minutes' walk of the sculptor's studio. Taking the form of an obelisk, the memorial is adorned in front by a bronze replica of the figure of the sorrowing Muse seen at the base of the Shelley Memorial in Oxford, while at the back is a medallion portrait of the sculptor. The memorial was executed jointly by Mr. J. W. Simpson as architect and Mr. A. C. Lucchesi as sculptor. The pedestal is of Bath stone. We shall illustrate the memorial shortly.

In the case of Ernest Keppel Purvell, architect and surveyor, of 32, King Richard-street, Coventry, and carrying on business at 3, Earl-street, in the same city, the statement of affairs issued by the Official Receiver shows gross liabilities of £261, of which £256 is expected to rank. The assets are estimated to produce £30, and with preferential deductions the deficiency is £231.

LEGAL INTELLIGENCE.

INSURANCE OF BUILDERS: IMPORTANT TO THE BUILDING TRADE.—A case of great importance to builders was heard at the Bolton County-court on Friday, when Robert W. Kenyon, builder, Sparrow, sued the Life and Health Assurance Association, Ltd., Elinburgh, for indemnity under a policy of insurance. Mr. Adshead was counsel for the plaintiff, and Mr. Langdon represented the association. A large number of builders were in court, as the action was regarded as a test case. In November last one of plaintiffs' workmen, a man named James Crook, was working at Messrs. Blair and Sumner's bleachworks. He was helping in the erection of an iron pillar, when the pillar fell and caught Crook, who succumbed to his injury. At the county-court arbitration the window of Crook was awarded a sum of £130. Plaintiff was insured with the association, who repudiated liability and resisted the claim. Mr. Langdon, for the defence, contended that the work in which Crook was engaged was of a hazardous nature, that plaintiff did not sufficiently disclose the class of his business, that the work done by Crook did not come within the terms of the policy, and, therefore, plaintiff was not entitled to indemnity. Judge Bradbury found that the work was covered by the policy, and gave a verdict for £166 14s. 4d., with costs. It was intimated that the verdict would be appealed against.

TEMPORARY SEATS IN CHURCHES.—Messrs. W. Densham and Sons, builders, of Circus-road, St. John's Wood, were summoned at Westminster Police-court, on Friday, by Mr. Dru Drury, district surveyor for Westminster, for beginning a work before sending a building notice, as required by section 145 of the London Building Act, 1894. Mr. Daldy was counsel for the district surveyor, and Mr. R. Cunningham Glen for the defendants. It was explained by Mr. Daldy that the structure in question was a block of seats put up in the Westminster Cathedral for the purpose of the production of a piece, "The Dream of Gerontius," at the beginning of last month. The section of the Act laid it down that where a building or structure was about to be begun, the builder was to serve a notice on the district surveyor before he commenced the work, and the Act also provided for a penalty if he failed to serve that notice. In the present case notice had not been served, and the question for the magistrate briefly was whether a builder could get out of the obligation to serve a notice because he had put up a structure inside instead of outside a building. Mr. Glen urged that the case was on all fours with that of "Yeue and McDonnell," which had reference to the seats at the Agricultural Hall. Mr. Daldy: But these seats are part of the equipment of the building. Mr. Glen: I dispute my friend's suggestion that because the seats at the Cathedral may not be put back again they are, therefore, not fittings of the Cathedral. This is but an endeavour to get out of a difficult decision against him. In the case of the seats at the Agricultural Hall it was held that the section of the Act in question did not apply. Mr. Horace Smith, after looking at the case cited by counsel, said he thought he was bound by it. He regarded the present case as indistinguishable from the other. The summons would, therefore, be dismissed. Mr. Glen asked for costs, saying that the district surveyor had his attention drawn to the decision referred to. Mr. Horace Smith refused costs.

SEWAGE-DISPOSAL DIFFICULTIES AT WORCESTER.—Mr. Justice Wills and Mr. Justice Channell, in the King's Bench Division on Monday, heard a dispute between the Local Government Board and the corporation of Worcester, which arose as far back as 1891, and had reference to the carrying out of sewerage works under the Worcester Improvement Act. The Board had appealed to the Court to compel the corporation to carry out the work, and after many stages a peremptory writ of mandamus was issued. To this the corporation had made a return to the effect that they were carrying out the work. The Crown said this was not a sufficient return. The Court ordered writs of attachment against seven councillors who had been originally served with the order, but they would lie in the office until Nov. 15. With regard to the remaining forty-one councillors, the matter would stand over until Nov. 15.

LONDON BUILDING ACT, SECTION 13: ERECTION OF BUILDINGS ON STREETS (ADDITIONAL HEIGHT).—In this case it was proposed to erect a building within 20ft. of the centre of the road at a greater height than the buildings formerly existing on the site. The London County Council summoned Messrs. Patman and Fotheringham, the builders, and the case came on before Mr. Bros on July 18, 1902, at the Clerkenwell Police-court, when the magistrate dismissed the summons. The facts were not in dispute—the respondents were erecting two new buildings to be used as factories on the west side of Eyre-street Hill, which, at the place in question, is about 21ft. wide. On Thursday, May 14, 1903, the appeal came before the King's Bench Division of the High Court of Justice, the Lord Chief Justice (Lord Alverston), Mr. Justice Wills,

and Mr. Justice Channell. Mr. Horace Avory for the London County Council, and Mr. Macmorran for the contractors. Judgment has now been given. The Lord Chief Justice said that although there might be a great deal to be said on general principles that if a person is going to make more value out of an old site by erecting new buildings upon it, certain concessions might be made to the public without payment, this section, at any rate, does not enable the public to claim them. Quite apart from the decision, he thought that the magistrate was right in the view he took that this is a site section. The plan which is to be provided is a plan which will show the extent of the building and the extent of the forecourt or other open space between any external building, and then he may re-erect, but that no such land within the prescribed distance shall be occupied by the re-erected building, or structure, or forecourt, or such other open space as aforesaid (if any), except that which was occupied within the prescribed distance, and then it seems to me that the manifest intention of the section is to deal with the ground area, and the ground area only. What other restrictions there may be with regard to factories and buildings in other parts of the Act of course we have nothing to do with. Mr. Avory contended that it was not re-erection, because the construction was of an entirely different character. Apart from that, the judgment upon which the learned magistrate acted was a direct authority. Certainly there is a passage in the judgment in which the judges take exactly the same view of the section, and given it was decided that the houses were not artisans' dwellings, then the argument that re-erection meant re-erection for the same purpose, or an analogous purpose, would have arisen there. He therefore came to the conclusion that the judgment of the magistrate was right. Appeal dismissed with costs.

CHIPS.

A statue of Jules Simon, on the Place de la Madeleine, opposite the house in which he lived for over half a century, was unveiled on Sunday. M. Denys Puech, the sculptor, has represented Jules Simon standing by the side of the Tribune with folded arms. The pedestal is ornamented with two bas-reliefs, the one showing him in his study, and the other at his desk at the Sorbonne.

The sales at the Mart, Tokenhouse-yard, last week, as registered at the Estate Exchange, amounted to £276,215, as against £85,914 for the corresponding week of last year.

At their next meeting the Bradford City Council will be asked to agree to the extending of the town-hall on the site now occupied by the old conditioning house, at an estimated cost of £63,000.

A Church of England Soldiers and Sailors' Institute is in course of erection on Devonport Hill, Plymouth. It is Queen Anne in style, and contains on the ground floor recreation hall, 50ft. by 23ft., coffee hall and bar, reading, writing, and devotion and biblical room, and on the first floor are suites of married quarters of a sitting and bedroom each.

The Bishop of Clifton has solemnly blessed the new Catholic school of St. Joseph at Nymphfield. The school provides places for about 75 children, and has playgrounds attached. The work has been carried out by Mr. Thomas Cox, builder, according to the design of Mr. Walter B. Wood, A.R.I.B.A., of Gloucester.

The foundation-stone of the Baths-road Church, Roker, Monkwearmouth, Sunderland, which is to be the new home of the Dandas-street Congregationalists, was formally laid on Friday. The building, which is from designs by Messrs. Jos. Potts and Son, architects, will cost about £5,000. Mr. J. B. Stott is the contractor.

The Birmingham Electric Supply Committee have decided to recommend the appointment of Mr. R. A. Chattock, at present electrical engineer to the Bradford Corporation, to the position of city electrical engineer, in succession to Mr. J. C. Vawdrey. Seventy-nine candidates originally made applications.

As the collection of examples of British engraving and etching brought together in the galleries of the India Section of the Victoria and Albert Museum continues to attract many visitors, the Board of Education have arranged that it shall remain open until September 30 next.

Mr. H. I. Sanders, builder and contractor, of Southampton, the present Mayor of Southampton, has been elected an alderman of that borough.

For the building of the new lunatic asylum at Whitchurch, Glam., the corporation of Cardiff have accepted the tender of Messrs. King and Sons, of Westminster, at £232,390.

Two new open spaces for Wandsworth have just been opened by the mayor. One consists of two acres of land in Merton-road, Southfields, the other of an addition of two acres to the western side of the Putney Embankment.

Our Office Table.

THE syllabus of the day courses in the Studio of the Architectural Association for the session 1903-4 has just been published by Mr. H. P. G. Maule, who has recently been appointed master, in succession to Mr. A. T. Bolton. The next term opens on Sept. 28, and will close on Dec. 18; the hours are from 9.45 a.m. to 5 p.m., and 1 p.m. on Saturdays, and the fees are 15 guineas per term, or 45 guineas per annum, for the first year's course, and 10 guineas for the second year's course. The following subjects are included in the curriculum:—First year's course. The studio: The use of instruments and scales, freehand drawing, elementary perspective, orders of Classic architecture, elements of the various styles of architecture, elementary construction, and sketching and measuring details and portions of existing buildings. Lectures: History of architecture, thirty-six lectures (illustrated by visits to buildings and museums); and elementary construction and materials, thirty-six lectures (illustrated by visits to workshops and buildings in progress). In the second year the subjects taken up are the principles of architectural design, and perspective and sciography.

THE report of the trustees of the National Portrait Gallery for 1902 states that the list of donations, loans, and bequests has now been brought up to 744. The number of pictures and engravings on the walls of the National Portrait Gallery is 1,248, of works in sculpture 158, and of miscellaneous portraits exhibited in cases 41, making a total of 1,447 portraits exhibited. The trustees now report that the whole collection of framed portraits has been placed under glass with the exception of four portraits and three very large groups, which it is not deemed expedient to glaze owing to the difficulty of viewing them in their present position; they are, however, protected by barriers and placed under the constant supervision of the attendants and police. Since the issue of the last report five portraits have been provided with new frames, 32 frames cleaned and repaired, 42 portraits placed under glass, 22 metal tablets written, and four new pedestals made. The total number of visitors from January 1 to December 31, 1902, was 151,352, of whom 130,583 were admitted free of charge. In view of the approaching changes at St. George's Barracks, immediately adjoining the Gallery, the Trustees call attention to the condition of the Gallery, and to the urgent need for some future extension of the building. As this can be done only by building on some portion of the ground now occupied for military purposes, the Trustees express their hope that, in the event of any redistribution of the site now occupied by St. George's Barracks, sufficient space may be reserved for the adequate extension of the National Portrait Gallery, as soon as circumstances permit.

THE highways committee of the London County Council have prepared a scheme embracing proposals for the construction of new, and the doubling and reconstruction of existing, tramways, for which they advise the Council to seek Parliamentary power in the Session of 1904. The proposals, which are 18 in number, will in most cases involve large and costly street widenings, which the improvements committee recommend shall be carried out under certain conditions as to contributions from local authorities. Most of the schemes are revivals of former proposals which were dropped on account of the refusal of the local authorities to sanction the tramways, or, in some cases, to contribute to the cost of the street improvements. The estimated gross expenditure involved in the proposals now brought forward is £2,302,555, of which £722,230 is for street improvements and £1,580,325 for tramway construction. It is estimated that £37,430 will be realised by the sale of surplus lands. The only charge on the rates will be the outlay by the improvements committee of £228,000 on street widenings, and this will be equivalent to about £11,500, or 0.6787 of a penny in the pound. The most important of the proposed new tramways are the following:—From the Hampstead-road terminus to a point in Tottenham Court-road near Oxford-street; Westminster Bridge-road via Victoria Embankment to north side of the Strand; Greenwich to East India Dock-road via the Blackwall Tunnel; Shepherd's Bush to Marble Arch, and from Marble Arch to Cricklewood; Deptford to the Herbert Hospital, Woolwich, and

from Battersea Park-road via Battersea Bridge to King's-road, Chelsea.

THE annual exhibition of the work of the students in the London County Council Central School of Arts and Crafts is being held this week at 316, Regent-street, and will remain open to-day (Friday) and to-morrow. The school, which is under the direction of Mr. W. R. Lethaby, was established by the London County Council Technical Education Board in 1896, and supplies persons engaged in artistic handicrafts with that training in design and manipulation which, owing to the subdivision of labour in modern processes of production, they are unable to obtain in the workshop. During the past session 731 individual students joined the school, mainly apprentices and journeymen in the artistic trades. The class entries numbered 1,008, and the student hours worked amounted to 50,948. These figures are the highest yet recorded. In the stained-glass class students are assisted to learn the whole of their craft, so that they are taught to cut glass for painting on, and to lead it up when it is painted. Those who show special aptitude are encouraged to practise original composition, the study of Nature as the basis of the higher forms of ornament being insisted on. In the silver-smiths', goldsmiths', and jewellers' work, chasing, engraving, &c., the exhibits are the work of lads or journeymen ranging in age from 14 to 21 years. In the classes every effort is made to give students a broader view and practice of the craft in which they are engaged. Other sections of the exhibition include furniture and architectural designs, wood carving, enamelling, drawing from the cast, lettering, writing and illumination, and lithographic drawing. The school has long outgrown the accommodation provided in the present temporary premises in Regent-street, and plans are now being prepared for a permanent building to be erected on a site in Southampton-row allotted by the County Council for the purpose.

THE bequest of the late Mr. W. H. Cope to the Victoria and Albert Museum, South Kensington, is now exhibited in the Cross Gallery. Attention may be called to the fine examples of carvings in jade, crystal, and other stones from China and India which fill the first case. Amongst them may be noted a crystal bowl and a crystal teapot enriched with stones in gold and flowers composed of rubies, emeralds, and diamonds. On the top shelf in the same case are a pair of very fine dark-green jade candlesticks carved with flowers. The mandarin's rosary suspended at one end is a beautiful work of art. The next case is devoted to a miscellaneous collection of lacquer work, Chinese enamels, and Japanese netsukés, mostly little ivory groups, wonderfully carved. The third case contains a collection of glasses, amongst them being some tall Venetian wineglasses with stems of marvellous shape, which Mr. Cope acquired at the Magniac sale. In this case likewise are some dark blue glass flagons with painted ornament, formerly in the famous Bernal collection. Specimens of Chinese porcelain fill the two remaining cases, and form in themselves quite a representative collection. There are examples of biscuit-body vases of the "famille verte," and wine-pots in the form of mythical lions; bottles and jars with blue and white decoration; vases with splashed glazes, hitherto unrepresented in the museum; a very rare powdered blue bottle in the form of a triple gourd, enriched with polychrome flowers in white panels; and a very considerable collection of eggshell cups and saucers and plates of the Chien-lung period (1736-1795), most delicately painted with flowers and figures.

CANON CLAYTON, the Vicar of St. Mary Magdalene's, Oxford, beside whose church the well-known Martyrs' Memorial was built sixty years ago, publishes a letter from Mr. H. W. Moore, F.R.I.B.A., throwing cold water on the alarmist statements that have been made respecting this beautiful monument of the Early Gothic Revival days. Mr. Moore points out that a pyramidal structure of such a form as the Martyrs Memorial cannot collapse, and the only decay apparent is on the surface of a few richly worked stones, some of which have fallen out, but always within the railed inclosure, without risk to passers-by. The facework has sealed in places owing to the weather, and the drapery of some figures shows signs of perishing; but all these defects are, Mr. Moore candidly points out, but superficial. His opinion is that it is premature to contemplate anything like a general restoration of the monument at the present time;

it can be safely postponed for some years to come. The only recommendations which Mr. Moore now makes are (1) that the steps forming the platform (some of which have slipped out of place) should be reinstated; and (2) that the gutter running behind the parapet of the first stage should be thoroughly cleaned and rendered watertight. Canon Clayton adds that should the time come when a thorough restoration is necessary, he and his churchwardens will appeal to the public for funds, but that period has certainly not arrived.

A PROVISIONAL scheme for a systematic record of ancient defensive earthworks and fortified inclosures in this country has been prepared by the committee appointed at the Congress of the Archaeological Societies on July 10, 1901. The committee suggest that secretaries of the various archaeological societies, and other gentlemen likely to be interested in the subject, should be pressed to prepare schedules of the works in their respective districts, in the hope that lists may eventually be published. The list should be confined to defensive works, omitting burial barrows and boundary banks. Though record should be made of any "finds" indicative of period of use of the forts, no effort need be made to assign a definite period of construction, excepting in those cases in which the age is beyond question—e.g., camps and fortified settlements of undoubted Roman origin, or inclosures of proved Neolithic, Bronze, or Iron age. The committee now consists of the following members:—Professor Boyd Dawkins and Professor B. C. A. Windle, Mr. W. J. Andrew, Mr. A. R. Goddard, Mr. I. Chalkley Gould, Mr. W. H. St. John Hope, Mr. J. Horace Round, and Mr. W. M. Tapp. The committee hopes that the issue of the provisional scheme will enlist the earnest co-operation of archaeologists and observers in all parts of the country, and thus serve towards the preservation from mutilation or destruction of these priceless relics which no laws protect.

THE annual report of the work done under the supervision of the building plans committee of the Leeds Corporation for the 12 months ending March 25 has just been issued, and gives evidence as to the steady extension of the town, though the total number of plans submitted last year was only three in excess of the year before, and falls below the number sent in during 1901, 1900, and 1899. The number of plans approved (2,208) is, with one exception, higher than has been the case since 1898. The number of buildings approved was 8,971, as compared with 7,828 in 1902, 8,952 in 1901, and 9,439 in 1900. Some 559 house plans were approved, representing in all 3,529 houses, of which 38 were villas, 177 semi-detached villas, 912 through houses, and 2,402 back-to-back houses. There were 31 miscellaneous plans, including designs for two churches, three chapels, nine schools, and four factories. During the year ended March 25, 1903, 2,572 houses were completed and certified for occupation. These comprised 18 villas, 99 semi-detached villas, 892 through houses, and 1,563 back-to-back houses, whilst 1,809 miscellaneous buildings were erected.

A FRIENDLY cricket match was played on the Butts Ground on Saturday afternoon last between teams of the employés of Waygood and Otis, Limited. The eleven of the cricket club run in connection with the London works visited the city to meet a scratch eleven representing the Vulcan Iron Works, Coventry. The home team batted first, Hiorns and Farren opposing the bowling of Case and Phillips. A fair beginning was made. Though Hiorns gave an early chance, he batted steadily. Farren made a big leg hit for five, and then, through a misunderstanding, Farren failing to respond to a call, Hiorns was run out at 22, of which he had made 12. Partnered by North, Farren went on by driving Case to the boundary; but the bowler had his revenge in the next over, shattering North's wicket. Sutton, next man, had a lucky escape from being run out, and soon after skied Phillips into his own hands. Harriden then succumbed to Phillips, and four men were out for 32. Clayton went in, and Farren made a good stroke to the leg boundary, and the pair soon showed a strengthened score, but after a spirited stand had brought in 38 in quick time, Clayton was clean bowled in the first over of Dawson. The fresh bowler proved effective. In his second over he fetched out Reynolds, breaking the stump. Loud cheers greeted Punshon's first run, gained by skying Phillips in the slips, and escaping by a miracle. He only survived, however, to make a couple of brilliant strokes off the same bowler. At seven

for 79, Farren was joined by J. V. Reynolds, and shortly after attained his half-century with a big hit across the ground, which was run out for six. He was out i.b.w. at 93 for a freely hit 56. Reynolds and Raynbird stuck together gamely, the latter batting in capital style till at 120 he was beaten by Phillips. Rose, the last man in, was bowled first ball, and the innings closed after an hour and three-quarters—a very respectable show for the homesters. Case had three wickets for 24, Phillips four for 45, Dawson two for 21, and Stacey one for 19. Coventry Works XI. total 120: London XI. all out for 94.

THE scheme for providing huge monolithic columns for the Cathedral of St. John the Evangelist in New York, now in course of erection from designs by Messrs. Heins and La Farge, of New York, has proved impracticable. The cathedral is to have 32 granite columns in the choir, each 54ft. high and 6ft. in diameter, their weight being 160 tons each. It was intended that these columns should be monoliths, but it was found impossible to turn such huge blanks even in the great lathe which was built to receive them. The blanks weighed 310 tons, and they were placed on the lathe, whose bed is 86ft. long; this bed weighs 135 tons and swings 6ft. 6in. Eight tools were used, each taking a 3in. cut. The turning operation proceeded smoothly, the lathe was operated day and night, and the first column lacked only a few hours of completion, when late one night it broke in two, entailing the loss of a year's time, to say nothing of the valuable piece of stone. The second monolith never reached the polishing stage, for it gave way while being rounded into shape. The accident is attributed to the great torsion which deformed the block beyond the modulus of elasticity. The third attempt was also a failure, and the company deemed it inexpedient to risk any more columns of the monolithic type, so they are now being made in two sections. They will be towed to New York from Vinalhaven, Maine, on a barge, four sections at a time, and will be landed at the foot of West 32nd Street, and they will then be rolled to the cathedral. Had it been possible to produce the monoliths, they would only have been exceeded in size by those of St. Isaac's Cathedral, in St. Petersburg.

MEETINGS FOR THE ENSUING WEEK.

SATURDAY (TO-MORROW).—St. Paul's Ecclesiological Society. Vi-it to Chigwell under guidance of R. Howard Wall. Train from Liverpool-street to Chigwell, 2.44 p.m.

THE ARCHITECTURAL ASSOCIATION.

JULY 25th: FOURTH SUMMER VISIT—to Waltham Abbey, Waltham Church, and Coppell Hall, Essex. Train leaves Liverpool-street at 2.44 p.m., returning from Waltham Cross at 7.40 p.m. P.O. 3s. 6d. (including rail, tea, and drink) to be sent to the Secretary, at 36, Great Marlborough-street, before FRIDAY, July 24th.

H. P. G. MAULE } Hon. Secs.
H. TANNER, Jun. }

At the parish church, Whitechurch, Oxon, on Saturday last, Mr. Elward W. Mountford, F.R.I.B.A., of Munstead Grange, Godalming, was married to Dorothy, second daughter of the late A. G. Hounsham, of Heathside, Hampstead Heath, and of Mrs. A. G. Hounsham, of 91, Cannon Hill, N.W., and The Cottage, Pangbourne.

Mr. Lawrence W. Chubb, secretary to the Commons and Footpaths Preservation Society, 25, Victoria-street, S.W., informs us that the Wiltshire County Council has now definitely declined to protect the public rights prejudiced by the obstruction, by means of a high barbed-wire fence, of all the roads leading to Stonehenge. The society has reluctantly been forced to appeal for funds to enable the question to be brought before a Court of Law. The society hopes to raise a guarantee sum of £2,000.

A committee of the House of Lords passed, on Tuesday, the preamble of the London County Council's Tramways Bill, so far as relates to Tramway No. 3, three miles in length, starting from the borough boundary of Hammersmith, north of Wormwood Scrubs, and terminating in the Hammersmith Broadway, also No. 6 and 6A, short sections of double line from Wimbledon-road to the line already authorised in Garratt-lane, Wandsworth.

The London County Council on Tuesday approved, subject to certain conditions, the plans submitted by Mr. F. Matcham, on behalf of Mr. Oswald Stoll, of a building to be known as the Coliseum, which it is proposed to erect upon the site of houses abutting upon St. Martin's-lane, Bedfordbury, and May's Buildings.

An adjudication has been made in the case of Ernest Kappel Purnell, of Coventry, architect and surveyor.

THE 'FAWCETT' FIREPROOF FLOOR

"The most scientifically fireproof construction that has ever been designed,"

IS SPECIALLY SUITABLE FOR

Hospital, Infirmary, & Asylum Buildings,

WESTMINSTER, S.W.

Trade News.

WAGES MOVEMENTS.

THE LABOUR MARKET IN JUNE.—The month's memorandum prepared by the Labour Department is based on 3,278 returns—viz., 2,103 from employers, or their associations, 1,140 from workmen and trade-unions, and 35 from other sources. Employment in June showed some decline as compared with May. As compared with a year ago, employment continues to show a falling off. In the 226 trade-unions, with an aggregate membership of 556,695 making returns, 24,801 (or 4.5 per cent.) were reported as unemployed at the end of June, as compared with 4.0 per cent. in May, and 4.2 per cent. in the 224 trade-unions, with a membership of 544,893, from which returns were received for June, 1902. The mean percentage of unemployed returned at the end of June during the past decade was 3.9. In the building trades, employment continues moderate, showing no marked change as compared with a month or a year ago. The percentage of unemployed trade-union members among carpenters and joiners was 3.4 at the end of June, compared with 2.6 at the end of May, and 3.0 a year ago. The percentage for plumbers was 7.6 at the end of June, as compared with 6.4 in May and 5.5 per cent. in June, 1902. In the furnishing and woodworking trades, employment remains fair in the furnishing trades, and about the same as a month ago. With coopers it is still bad; with mill-sawyers it is fair on the whole. The percentage of unemployed trade-union members at the end of June was 3.0, as compared with 2.8 in May and 2.9 in June, 1902.

BRICKSETTERS' LABOURERS IN CONFERENCE.—The Manchester and Lancashire district of the Bricksetters' Labourers Society met in conference at the Oddfellows' Hall, Eccles, on Friday, under the presidency of Mr. Burn, of Liverpool. A resolution was passed appealing to all men to join trades-unions and to support Labour representatives in Parliament, so that a Bill may be placed on the Statute Book giving trades-unionists the power to dispose of their funds as they may think proper in regard to "picketing" and lock-outs, &c., and also amend the Workmen's Compensation Act in regard to the 30ft. limit on the height of buildings in course of erection, and other matters.

NEW YORK.—Twenty thousand skilled builders' workmen resumed work on Monday, and thirty thousand more on Tuesday and Wednesday. Unions numbering fifty thousand adherents having accepted the employers' terms. The effect of these is to do away with the walking delegate. Provision is also made for the appointment of a Joint Arbitration Board to settle trade disputes. Many builders' labourers and a large number of other unskilled hands resumed work.

The dedication took place on Sunday of the new reredos just erected at St. Erth Church, West Cornwall, by the Harvey family of Hayle. The reredos is constructed entirely of West of England grown oak. It is in the 15th-century style of Gothic art, occupying the whole of the space beneath the great east window, and is made from a design by the Rev. R. Medley Fulford, formerly F.R.I.B.A. The work has been carried out by Messrs. Harry Hems and Sons, of Exeter.

The death is announced at the age of 83 years of Mr. T. Stanton, for many years a builder and contractor at Torquay. He retired from business about fifteen years ago.

In the grand hall of the Royal Hospital, Chelsea, on Tuesday, Field-Marshal Sir Henry Norman unveiled a portrait in oils of the late governor of that institution, Field-Marshal Sir Donald Stewart. The portrait, which is three-quarter length, and was painted by Mr. Frank Brooke, hangs in a prominent position at the end of the hall, the subject being represented in full uniform with medals and decorations.

The Edinburgh Town Council on Tuesday, while deferring a final decision, gave favourable consideration to a request for a site in West Princes-street Gardens for a memorial to the Royal Scots who fell in South Africa. It was stated that the monument would cost £3,900. It will be an equestrian statue of a trooper to be executed by Mr. W. Birnie Rhind, A.R.S.A., of Edinburgh.

At their meeting on Saturday, the Metropolitan Asylums Board approved of alterations being made in the Fountain Hospital buildings in order to minimise the risk of fire, as advised by the architects, Messrs. T. W. Atwinckle and Son, in their memorandum, at a total estimated cost of £13,200; and decided that application be made to the Local Government Board for their sanction to this course.

The Anstruther Harbour Commissioners decided on Monday to appoint Mr. Henderson, C.E., Burntisland, to draw out plans for the repair of the west pier, which is considered to be in a tumble-down state, at a cost of £2,000.

CHIPS.

The Essex County Council are about to borrow £30,000 for the rebuilding of Barking and Ilford Bridges and the purchase of the site for the new county lunatic asylum at Colchester.

The Bignold Cottage Hospital was formally opened at Wick on Monday by Sir Felix Semon, London, one of the King's physicians. The hospital is the gift of Mr. Biguold, M.P. The building, with additions and structural alterations, cost upwards of £3,000, and includes ten wards and operating-room.

Mr. H. Ross Hooper has held an inquiry at Watford into the application of the urban district council for sanction to borrow £1,500 for purposes of electric lighting.

The Mayor of St. Pancras (Alderman W. H. Matthews) unveiled, on Tuesday, a cross of Sicilian marble, which has been erected by public subscription, over the grave of Mrs. W. D. Walters, wife of the Rev. W. D. Walters, and mother of the Rev. C. Easor Walters, in Highgate Cemetery. Mrs. Walters lost her life in saving a little child from being run over by a heavy dray at Woolwich, on October 8, 1902. The memorial is in the form of an Irish cross, bearing a figure of the Saviour blessing little children, and the words, "Ye have done it unto Me."

The partnership hitherto subsisting between F. F. Nichols, E. C. Nichols, and G. Chuter, architects, &c., Howard-street, Strand, London, W.C., under the style of D. Cubitt Nicholls, Sons, and Chuter, has been dissolved, so far as regards E. C. Nichols.

The west-end window of St. Andrew's Parish Church, Hingham, Norfolk, has been filled with stained glass as a memorial to the late Lady Augusta Noel. The central subject is the Angel proclaiming the Resurrection to the faithful women, whilst in the background Jesus Christ is appearing to Mary Magdalene. At the foot are the arms of the Albemarle and Noel families, also those of the Province of Canterbury. The artist is Mr. Herbert Bryan.

A new church is about to be built at the corner of Sandhurst and Torridon-roads, Lewisham, from plans by Mr. Philip A. Robson.

An inquiry in connection with the application of the Ballymena Urban District Council to the Local Government Board for Ireland for a loan of £29,000 for the purpose of purchasing and extending the local gasworks was held last week by Mr. A. D. Price, M.Inst.C.E., in the urban council chambers, town-hall buildings, Ballymena.

The memorial-stone of a Baptist mission-hall was laid at Yarmouth last week. The hall will be one floor in height. It is being built by Mr. C. C. J. Cayley, of Stanley-road, Yarmouth, and will be 36ft. long and 26ft. wide, with a height of over 30ft. over all. The exterior is of red brick, and the roof will be open timberwork inside.

THE BUILDING NEWS AND ENGINEERING JOURNAL.

VOL. LXXXV.—No. 2533.

FRIDAY, JULY 24, 1903.

STUDENTS' WORK.

AT this time of the year the interest attaching to the work of students of the London County Council Central School of Arts and Crafts is made obvious by the annual exhibition of students' work, which we briefly noticed last week. An examination of the different crafts reveal decided progress in design and workmanship. Much of this is due to the direction of Professor W. R. Lethaby and his colleagues. Comparing the present with the earlier results of the school, which was established by the Technical Education Board of the L.C.C. in 1896, it is not difficult to trace the influence of the inculcation of sound art principles upon those engaged in artistic handicrafts. Before this school and other influences had made themselves felt the craftsman had a very unsatisfactory idea of art: he thought, from the method of its teaching, that it was something foreign to his own craft; an addition of extraneous ideas and methods; a something which had to be learned in a school and applied whenever the occasion arose. By the subdivision of labour and processes the craftsman had only a partial idea of his art from the training he received in the workshop. In the designs for architectural subjects and furniture we notice this influence in a very marked degree. The designs for a country house, for example, show a desire to break through conventional methods, and to rely upon honest means of effect, though perhaps a little too much is devoted to picturesqueness rather than to plan in the disposition of the rooms and means of access. The design by Vincent Hooper exhibits some inventiveness in the plan in the octagon bay or hall and kitchen offices wing. The grouping externally of the octagon feature is pleasing; red brick and tile roof are shown, and the drawings are well executed. The design by Alick Horsnell, Chelmsford, is also simply treated in dark red brick, but the passage between dining-room and kitchen is long. G. A. Bryan has for the same subject a brick and stucco treatment; the plan is less satisfactory in the staircase and passage round pantry and the corridor above. The details are well drawn. In the design of Fred. G. Mitchell a similar external treatment is adopted, with high tile roof. Unnecessary labour is shown in the patterns of tile paving, to the confusion of plan, which is skilfully drawn. A wide corridor, a dining-room, 26ft. by 16ft., and a drawing-room 24ft. by 16ft., which are entered from the former, and a serving-room next kitchen and pantry, are features of the plan. The details are cleverly drawn to $\frac{1}{4}$ in. scale. For a suburban house, Frank H. Porthall sends a four-storied red brick and tile-roofed design, with roughcast in gable and upper story. The plan shows a large drawing-room and a small dining-room. The entrance lobby arrangement looks awkward in the elevation. A design for a private hotel, by F. G. Mitchell, is a five-storied building, the entrances and corners marked by red brick and stone quoins. The author shows on one side a restaurant entrance to the ground floor and a private hotel entrance on the other side. The restaurant is divided into tables and seats, and has a recess. On first floor there is a large lager-beer saloon, and bedrooms above, with kitchen, &c., in basement. Two sets of drawings represent a school for 300 juniors (mixed). One by G. H. Yeoman has a central hall, 54ft. by 34ft., lighted at one end and by dormers, with two classrooms on each side, 25ft. 6in. by 20ft. The

lobbies and cloak-rooms are placed at south-west end of large hall. The design by Harold Hutton Christie for the same subject resembles a similar type of plan: the entrances are placed at each side of the end of hall, and the elevation is rather better. There is still room for improvement in the external design; the gable end of the first design is needlessly cut up. A rather straggling and ill-devised plan for a country house is by S. Hubert Parry, who shows a design of a picturesque character. A small model of a country house, simple in plan, and quite square in its main walls, with the kitchen offices made a low projection, is also set. The external walls are brick, and roughcast above, with hipped tile roof. Amongst other work are measured drawings of Nixon's School, Oxford (now demolished), by Harold E. Wheeler. The interesting colonnade of the ground story, and the quaint gabled windows of English Renaissance character above, are drawn with firmness. It is an interesting example of old work. The designs for special features are few, and do not appear to take very well. A design for dining-room with ingle nook, is simply treated in the panelled walls and ceiling, and the details show knowledge. A small hall is another subject, by W. Kruger, drawn to $\frac{1}{4}$ in. scale; also a design for hall chairs of oak inlaid with ebony. The flat-cut balusters to staircase are suitable. We also notice suggestions for oak dining-table with carving, drawings of furniture from the South Kensington Museum; a mahogany writing-table. A design for dresser in oak has been sensibly treated by J. Robinson and Percy J. Smith; also suggestion for a sideboard in oak, with carved centre panel and bright steel fittings, is very cleverly treated. The designs of rush-bottom chairs in oak with square upright backs are too stiff and crude, and indicate the direction of the "New Art" movement. We also notice a design for a bishop's crosier in silver, with rock crystal, by M. C. Oliver, who also shows a design for a wrought gold pectoral cross, with sapphire centre and of good section. T. Gibson contributes designs for a silver casket, a saltcellar and spoon, and a candlestick in brass.

The sketches for figure composition, by J. H. M. Bonner, in colour and chalk, exhibit good arrangement and composition; one is based on the "Holy Grail." The compositions of M. J. Dawson and another are creditable.

The modelling and casting for silversmiths' work are chiefly the work of lads or journeymen, ranging in age from 14 to 26 years. The subdivision of labour and the machine methods introduced have often led to mechanical production, in which each lad is kept to one kind of article. Many apprentices to these trades have joined the classes without the most rudimentary knowledge of their trade. It is to supply this deficiency of the workshop that these classes are established; and in the silversmiths' classes the student is assisted individually in the design and execution of the work which does not form part of his workshop labour. One of the modelled specimens is an unfinished panel, "Flodden Field," after a sketch by Burne-Jones, by Albert J. Wilkins. A chalice, designed by Onslow Whiting, with wrought medallions, after Sir E. Burne-Jones, is well modelled. A horse modelled from the round is also clever. A case of beaten copper vessels, chalices, vases, and bowls, by various students, is interesting as evidence of a right motive in design and simplicity of treatment. H. S. Swinnerton and other students contribute specimens. The goldsmith work, jewelry, including brooches, bracelets, rings, combs, include a few designs exemplifying a proper sense of material. A broader basis of design is evident in these works, the object of the leading instructors in each class is to draw out

the craftsman's inventive powers within proper limits. In the modelling and sculpture room many life studies and designs are exhibited. Some of these give proof of decided ability. We can only mention the arch and spandrel, with figures in high relief, by G. D. Macdougald; the panel and figures by F. Lessore, a panel by M. J. Dawson, life studies by J. Lessore and Dawson. A small figure panel by the latter artist and Amy A. Wilkins, figure panels by H. W. Page, capital of pilaster by E. J. Singer, and life studies by Amy A. Wilkins of a girl's head, and another head in relief by E. Barton. The woodcarving and gilding is limited chiefly to carved frames, in which the carving or conventional scrollwork is inclosed by moulded edges and is in flat relief. These frames compare favourably with the meretricious and rococo carving we see on most modern gilt picture frames. The student is confined to the simplest elements that can be carved with the gouge, and is allowed to exercise his own inventive power in the design of the carving which is in strict keeping with wood. The wood inlaying is seen in the cabinetwork. We notice that great reserve is used: the inlays are introduced just where they give relief, and point to the design of the woodwork. The stained-glass work shows a true appreciation for correct design in the leadwork and colours, and the student is taught the controlling influence of leading and cutting in the design. He is taught the whole of the craft, instead of only one branch. We notice a few very excellent figure examples based in Italian art by G. F. Brodwick, by C. Presswell—a subject after Giovanni Bellini; also by Miss Bertha Bell, the Louvre Madonna after Botticelli. The patterns for "quarries" for diapers, heraldic and other accessories, show that fundamental elements of design are not overlooked. Original composition in this class of work is encouraged, and the study of nature and life studies of the school are enlisted as the basis of design. A case of enamelled work comprises many good specimens in this craft, including necklets, waistbelts, and work by Eva J. Nelson, M. L. Allis, J. Lindsay Black, M. C. Stevens, Dora M. Durlacher, Bertha Goff, and others. The woodcut in colour is a very interesting development of pictorial art, in which broad effects of tinting are produced by the simplest means. "An outline of the design is made upon thin paper, which is pasted face downwards upon smooth cherry-wood. A delicate cutting is then made along both sides of the line throughout the design, the cutting being so light as merely to break the surface of the wood. With curved chisels shallow depressions are then hollowed out between the cut lines. Subsequently, from impressions taken from this key-block and pasted upon fresh planks, cuts are made round the various shapes on the blocks required to print the coloured forms in the design." The gradations of tone are made by the printer's own skill in laying the colours (dry powder colours mixed with water and a little rice-paste) upon the wood blocks and in the use of the rubber. Many hundreds of impressions can be taken from one set of blocks. The specimens of these coloured woodcuts show the usefulness of the art, which can be applied to simple picture-books as well as designs. Lithography is shown by a few examples by Miss Dinaker, A. Weddington, Miss Harding, &c. Designs for wallpaper embroidery and the cases of book-binding are of interest, as are also the studies for lettering. In future it would be better to print the names of the students, as some of them are unreadable. A high standard of design and craftsmanship has been attained, which is highly encouraging to the school directors and managers.

The Board of Trade inspection of the electric tramways at Batley will take place on Monday next.

FIRE-RESISTING BUILDINGS.

FEW questions affecting building are of more urgent importance than those which relate to fire-prevention, and it is mainly in great cities that they chiefly apply. Good sanitation may be of more far-reaching consequence to the residents in our towns, bad drainage and defective plumbing may decimate our population; but these matters are both remediable to a great extent, whereas inflammable construction and predisposing causes of fire are not so easily dealt with. And the principles of fire-prevention have a more controlling influence on building, as they require the selection of materials and the adoption of methods of construction which have a more or less radical influence on the design. The profession will learn something by a careful perusal of the papers read and discussions that have been made at the International Fire Prevention Congress, convened by the British Fire Prevention Committee, and which we have reported in the last two weeks' issues. The conference on such a subject is valuable, because it shows how varying the conditions that prevail are. As Dr. Edward Atkinson, president of the Boston Manufacturers' Mutual Insurance Company, pointed out in his paper on the "Prevention of Loss by Fire in the United States," the problem presented to the underwriters of the United States is quite different from any problem that could be found in any European country, especially in Great Britain, by reason of the exceptional variations of climate and temperature that prevail in the United States. He says: "Within the great section which extends from the Atlantic to the Pacific between parallels of latitude 33° to 45° N., where are found the larger part of the population, the greater number of factories and workshops, the principal cities and public buildings, and by far the greater number of the school buildings, there are very great variations between summer and winter; the common range of the thermometer being from 30° below zero, sometimes lower to 90°, sometimes higher." The variation in humidity is also large. Then the conditions of American building varies in respect of the materials. The abundance of timber, resinous and hard wood, and the scarcity of good building stone, such as that used in France and Belgium or England, are well-known facts.

It happened, therefore, as the author says, that the best material for the construction of dwelling-houses in the early stages of towns and cities, and throughout the States, is wood rather than brick or stone. Again, he points out that brick and stone are not the best materials when exposed to the extremes of temperature or of humidity. When used without precautions in building thick walls with air spaces, they are alternately affected by heat and cold and dampness in excess, from which properly-constructed wood buildings are free. Brick and stone in an extremely cold winter become intensely cold, gathering humidity from the air within the dwelling, making the house damp and very difficult to heat. In the hot weather brick and stone buildings will heat rapidly, and, unless built with cavity walls, are intolerable to live in. On the other hand, wood is a good non-conductor of heat and cold, and when used in thick masses, the building is warmer in winter and cooler in summer, and more easily heated and ventilated than any other kind. These are well-established facts. When stone or brick is used, thick walls with air cavities become necessary to insure an equable temperature, and the result is better and less expensively obtained by using wood with a properly-constructed roof. These facts point to the very opposite conditions of the two countries. Nature has furnished America with the material that is best suited to her climate in abundance. In

the British Isles we have no conception of these extremes of temperature on buildings. If we had such experience, many of our brick buildings would be impossible to dwell in comfortably. The builders in America have, it appears, not seriously thought of a change of material, but, as the author of the paper says, reverted "to the heavy timber construction of the Colonial period and the disposal of plank and timber within brick or stone walls in such a way that there may be no concealed spaces through which fire may pass out of reach of water." Factories built under the control of the Factory Mutual Underwriters have been constructed on this system. No effort has been made to construct fireproof mills and workshops; but by means of regulative measures and safeguards they have been rendered tolerably safe. Had more substantial materials been employed, these buildings would have become costly, and hence incapable of being converted, and it is considered undesirable that any factory or workshop should be planned to last more than 25 years. The textile factories and other industrial buildings of fifty years ago were narrow and several stories in height; but this type is superseded by buildings of not more than three stories in height for carding and spinning, and one-story shops for weaving and machinery are now built. Ribbed or prismatic glass is used to diffuse the light over the whole area. The upshot of Dr. Atkinson's paper is to show that these temporary unsafe wooden structures have been both necessary and expedient in the development of the country, that more permanent building would have absorbed capital and have been an encumbrance, and that the methods of construction of the United States have been adapted to climate, to materials, and to conditions of progress. Well organised and equipped fire departments are made necessary under these conditions. Among the more useful safeguards the author mentions the automatic sprinkler, which is being introduced on a large scale, and is found to abate more than one-half of the loss by fire. The losses by fire occur chiefly in buildings which are capable of being protected by sprinklers, standpipes, and hydrants at vantage points and upon the roof. The self-sustaining steel-frame building is a new problem alike to underwriters and engineers, and the Factory Underwriters soon began to discount the idea of incombustible materials being indestructible by fire, and have required that unprotected steel beams should not be used to support plank floors, and cast-iron columns have been discarded for square wooden posts. Dr. Atkinson says: "The experience of the underwriters who insure the steel-frame buildings has not justified the great confidence with which the work was undertaken. Very destructive fires have occurred in buildings of this type which have been filled with combustible contents. Several of the methods of protecting steel from heat have failed, and while the building has stood well and has been capable of repair, there has been much damage by heat, especially in the upper stories. It has proved that the prevention of loss by automatic sprinklers is as necessary in an incombustible building as it is in any other." Fires causing little damage have generated so much suffocating smoke as to make them dangerous in a panic. The engineering experiment station, established by the mutual underwriters, for testing by fire and laboratory experiment methods of fireproof construction, are now investigating the subject of protecting steel from corrosion, another element of destruction which promises to shorten the "life" of the steel skyscraper. From these facts it is clear that any conclusions drawn as to the means of fire-prevention in this country will not necessarily apply to buildings in the States or *vice versa*. Each country has to solve the problem in its own way. We have been, during the last decade

or so, arriving at certain stages. We have found by experience and laboratory experiments that certain incombustible materials like iron and stone are fraught with serious hazard in structures in which combustible goods are stored; that certain modes of protecting the metal are almost useless; and we have had to unlearn many of the principles which are considered at first to be infallible.

In the Section on Building Construction and Equipment, Mr. Arthur Pordage, fire-master, Edinburgh, contributed a few useful suggestions from his experience in combating fire. He observed that what is intended as a safeguard often becomes a danger. Several points of so-called "fireproof" materials which deserve consideration may be referred to. One general dictum or principle is made the starting point—namely, that materials which meet the requirements of fire-resisting buildings from the fireman's point of view are those which are not subject to the laws of expansion and contraction when exposed to heat. Here we have a principle to work upon which will exclude iron, stone, glass, and many other materials used in fireproof buildings, and Mr. Pordage says the results of the tests of time point to timber, bricks, mortar, and good plaster as not subject to the laws of expansion. The ordinary wood floor with a plastered ceiling comes under this rule. Such a floor has been found to stand the effects of a fire for an hour, and though it burned through in places, the firemen were able to pass over it. The author of the paper suggests that a well-constructed floor of this kind would resist fire even better. The ends of the joists should be well bedded in the walls, the flooring boards should not be less than 1 in. thick, tongued together, the spaces between the joists filled with pugging, and the ceiling coated with 1 in. of good plaster on wire laths. We have the practical opinion of a fire-expert that such a floor would resist a fire from top or underside sufficiently long to enable any fire brigade to complete their toilet before turning out and arrive in time to do good work and prevent floors from collapsing. Large floors which require to be supported are best aided by solid timber supports or columns, which become only charred on the surface. Mr. Pordage says if these wood posts were wire-lathed and plastered they would come out unscathed. Even when large spaces demand iron girders and columns, these should be protected; but the floor itself should be of timber, which, being a non-conductor, would remain in position. It is well known that steel joisting and concrete do not stand fire well: the concrete cracks and falls in patches, and does damage to the floors below. Experience at large fires has shown that firemen can depend on a wooden floor, while the "fireproof" one begins to break away directly the heat attacks it, the result of which is they cannot direct their efforts safely from the inside. The arguments are certainly strong from this point of view. The divisions into sections or "risks" of the interior of a building by partition is another question of equal urgency, for a fire spreads with alarming rapidity unless it is checked by barriers. Partitions act in this capacity, and according to their impermeable and non-conducting nature the spread of fire is impeded, or its progress greatly checked. Lath-and-plaster partitions are, of course, flimsy safeguards. They should be solid, of fire-resisting material, and there are a few patented materials, like the "Mack" partition or the Uralite slab, which will effectually check the progress of fire from one room to another if solid brick cannot be used. A solid partition, if carried up through the building, the joists going through them solidly so as to prevent any connection or space between one floor and the next, as in the case of hollow partitions, is a valuable barrier. The same objection to "fireproof" materials is urged against the stone or concrete stairs

unless built in a separately inclosed well, so that fire and heat cannot touch them, and the same author we have mentioned recommends solid hardwood as the most reliable under all circumstances. This we know is disputed by some authorities. We have to consult the experience of the fireman in these cases. A solid wood staircase, filled in with pugging and coated with good plaster, is found to be more reliable as a means of communication. Such a stair will remain in position long after it is possible for any human being to pass up and down it, while a stone stair would be unendurable, and liable to fly to pieces directly the hose is applied. Solid hardwood steps pinned into the wall securely will only become charred to a certain depth, and will remain of service for a longer time. The stone staircase, with ends pinned into the walls, has repeatedly broken or fractured near the wall end, and the whole staircase has fallen suddenly, as one did at the Polytechnic many years ago, if we remember aright. Experts, too, recommend for roofs just those kind which the artistic mind revolts against. Probably the best form of roof that is fire-preventive is a flat, solid roof of steel and concrete and asphalt, which would confine the fire, and prevent its bursting through too soon, while the flat roof would assist the firemen in their arduous task of extinguishing the flames in the rooms below. On the other hand, the favoured high roof with a large space underneath allows the fire to penetrate through the upper ceilings and to extend over the whole building or series of houses, unless each is kept separate by well-built party-walls carried up at least 3ft. above the roof. This is certainly a danger in the high, hollow roof of timber; it is suggested that the divisional walls should have a ledging of 24in. round the edge, which would admit of men working on it, and a means of saving life and attacking a fire. The light iron-trussed roof is, of course, preferable to pine timber in roof construction, with this end in view.

Perhaps the greatest aid to combustion and fire extension in buildings is the match-boarded partitions and ceiling. This is an employment of timber of the worst and most hazardous kind, for it admits the air behind it, and the wood being thin, dried, and of a soft, resinous kind, becomes most inflammable. The paint or varnish adds to the danger. Hard woods for wall or ceiling coverings are less objectionable if fixed solidly to wall without an air-space. In the same category we may place lift inclosures, which should be always of non-combustible material like brick, and the doors should be fire-resisting or armoured, and useful hints are given by Mr. Max Clarke, A.R.I.B.A. Lift-shafts, undoubtedly, present a very real difficulty to the architect; they are required to be light, and, as far as possible, open for light and entrance. The steel-framed inclosure, with wired or other fire-resisting glass, could be used where brick or more solid inclosures are impossible. The doors from each floor to the lift are important. They should be made to slide, and be well "armoured"; and should be close-fitting, and be secured by fastenings, to prevent buckling by heat.

The suggested sections on the London Building Act made by Mr. Dicksee, district surveyor, would assist greatly in the prevention of fire. At present the sections relating to fire have reference (1) to the separation of buildings; (2) the subdivision of the structure to confine the fire to one portion; (3) fire-resisting provisions relating to materials, &c.; (4) and sufficiency of exits. These provisions are only partially operative. The exempted sections of the Act, as we have repeatedly said, require revision. The law should have direct reference, not so much to certain limits of cubical or superficial area, as to the use of the building: whether they are filled with inflammable stocks or goods, or whether any

risky occupation, involving danger from this cause, is carried on. A greater evil and danger to the community is the existence of inflammable buildings of the worst construction, and without means of escape, with which the Act does not deal. Only new or altered buildings come under the provisions; there is nothing to make the owner of risky premises reconstruct them, or to provide means of escape for his employees in case of fire. It is not a matter of the infringement of vested interests, but the safety of tenants and workpeople in the large city warehouses—the right of the public rather than those of the individual owner. No one has a vested interest in allowing his premises to remain a danger to his employees and neighbours. The London County Council have provided for the safety of the public in theatres and other places of assembly under the Metropolis Management and Building Act, 1878. These are very stringent on the provision of exits, superficial areas on different levels, staircases, and other regulations. Old buildings for this purpose have to be reconstructed or improved, and the Factory and Workshop Act enforces regulations as to exits, stairs, &c., in old as well as new buildings. These enactments point to the urgent demands there are for rendering existing buildings safe. The means of escape from buildings are not practically dealt with at present, and when, as in the case of "Carritt v. Godson," the question has been raised, the weakness of the Act is shown. Again, tall buildings set back behind one-story shops have rendered it difficult to save the inmates in case of fire in the shops, and the building is too far back to be easily reached by the fire-escape. In all such cases fire-resisting exits through the shops ought to be provided. A more scientific classification of fire-resistance is required than now prevails. The subject demands that the limits of resistance in different kinds of buildings should be measured by other considerations than materials and methods. The degree of protection necessary in or near a city workroom filled with inflammable goods like cotton or furniture must be greater than that necessary for an ordinary dwelling-house, and the executive of the British Fire Prevention Committee are right in discriminating between fire-resisting materials and systems, and their suggested minimum standards of fire-resistance under the heads of Temporary Protection, Partial and Full Protection, are worth consideration.

QUEEN VICTORIA MEMORIAL.

PLANS this week have been on view in the tea-room of the House of Commons, illustrating the scheme as finally modified for the Grande Place which is to be set out in front of Buckingham Palace in connection with the Queen Victoria Memorial. The work of forming the plateau for this purpose is in hand, and the retaining-wall skirting St. James's Park is about to be commenced at once, because the earthwork thus undertaken and this wall will have to be finished by November next. The encircling road outside the inclosed area, which formed so conspicuous and fine a feature in Mr. Aston Webb's competition design, has been abandoned, and the traffic instead will pass in front of Buckingham Palace, much as it does at present. The monument surmounted by Mr. Brock's statue of the late Queen will be brought somewhat more forward into the Grande Place—or Queen's Garden, as it is to be called—to enable this road to be made, and in lieu of the stone colonnade with arched gateways which Mr. Webb designed in his modified scheme, a low iron inclosure railing will extend between the monument and the front of the palace. This is considered an improvement, and the opinion to that effect is based upon the appearance produced by a model to scale. It was felt that the gateways were somewhat overpowering as compared with the central feature or monument, which, of course, is the *raison d'être* of the whole thing. No doubt

it is difficult to judge merely from a drawing; but we are inclined to doubt the wisdom of the change which this low iron railing has introduced, and from a monumental and architectural point of view we can but regret that the grand roadway leading round the Queen's Garden up to the Processional avenue has been abandoned. We certainly think a great mistake is thus being committed. The inclosing colonnade will now be encumbered with the park grounds, and for such a purpose Mr. T. G. Jackson's proposal was much better adapted. A reference to our illustration of his design on Nov. 8, 1901, will demonstrate the correctness of this opinion, and no doubt his scheme was based advisedly on the assumption that the whole composition was to nestle as it were in the Park. Our illustration of Mr. Aston Webb's design appeared in the *BUILDING NEWS* for Nov. 1, 1901, and the plan in the following issue. The radius of the Queen's Garden will be 300ft., and the site of the memorial will now be laid out with flower-beds and grass-plots so as to give some idea of the ultimate form to be assumed by the permanent work.

LIVERPOOL CATHEDRAL COMPETITION.

COMMENTS have been made by ourselves and the profession generally on the acceptance of the position of joint architect to the Liverpool Cathedral by Mr. Bodley, one of the assessors in the recent competition. It is very rightly felt that, as a general principle, an assessor should have no interest, present or prospective, in the result of a competition, beyond assuring to the utmost of his ability that the best design should secure the award.

In the present instance we believe the following are the facts:—When it was ascertained that the author of the selected design was Mr. Scott, a young man of twenty-two years of age with no practical experience of building, the committee naturally felt great hesitation in placing so important a work in his hands. They at first decided to abandon the result of the competition altogether; but, under the influence of strong representations from the assessors, they afterwards reconsidered this decision, and invited Mr. Bodley to act as joint architect with Mr. Scott. This Mr. Bodley at first declined, but expressed his willingness to become "advisory" architect. The committee, however, would not agree to this suggestion, and it was plainly intimated that, unless he could see his way to taking the position of joint architect, Mr. Scott's design would be definitely abandoned. The situation thus created was a most difficult one, and in order to insure that substantial justice should be done, and that the competition, which had entailed so much thought and labour, should not prove abortive, Mr. Bodley finally agreed to the committee's wish, and became joint architect, a position which, however, he had neither sought nor desired. The publication of these facts will probably remove a good deal of misconception.

REGISTRATION OF QUALIFIED ARCHITECTS.

YORKSHIRE OPINION.

IN response to an invitation from the Royal Institute of British Architects, that the allied societies should express their opinions on the above subject, a special general meeting of the Leeds and Yorkshire Architectural Society was held on Tuesday evening in last week, the president, Mr. Butler Wilson, in the chair, when the following resolution was passed:—"Resolved—that in answer to the request of the president of the Royal Institute of British Architects, this meeting of members of the Leeds and Yorkshire Architectural Society, allied with the Royal Institute of British Architects, expresses itself in favour of the 'Statutory registration of qualified architects,' and expresses the hope that the Royal Institute will take early measures to give effect to a principle which would give our profession a recognised status, and raise the standard of architectural education and training throughout the kingdom."

The question of registration is, says the *Leeds Mercury*, now being discussed by the profession, and there is at present a Bill dealing with the matter actually before Parliament.

The statutory registration of architects infers that the right to practise under the style and title

of "architect" would be confined to those who were duly qualified to do so; and only such persons could legally sue for and recover fees for their services as architects.

It is expected that the result would be parallel to that effected by the registration of the medical and legal professions, the advantages of which, to both profession and public, have been too well proved to be referred to at length.

Registration will not prevent unqualified persons designing and superintending the erection of buildings, any more than the Medical Act can suppress quacks and charlatans; but it would at once distinguish the qualified from the unqualified, and be an act of justice both to profession and public, who would naturally hesitate to employ persons against whom they would have little chance of redress for negligence or incompetence in a Court of Law.

Those in favour of the movement are of opinion that registration would carry with it even more valuable consequences—viz., The further spread of sound architectural education and training; that registration will form the strongest inducement to our students to enter for and pass the qualifying examination on which their future status and prospects would depend. Although registration would admit, up to a certain date, architects at present in practice, who could furnish evidence of qualification to be termed such, without the test of an examination (as was the case with the medical profession), nevertheless the possible immediate and short-timed disadvantages would be far outweighed by the future gain to the rising and succeeding generations."

ON BUILDING TIMBERS.—XXXI.

TAMARAC—HACMATAC—OREGON PINE—SEQUIA.

THE greatest difficulty experienced in describing North American building timbers arises from the unfortunate practice, which is only too common, of giving the same name to different woods, and of sometimes using no less than a dozen different names for the same wood. Botanists are quite as much at fault in this respect as timber converters (lumbermen), for it is by no means rare to find the same name given to very different trees, or to discover that the same tree may be correctly called by half-a-dozen different scientific names. This confusion has arisen from the fact that when trees were first cut down for building or firewood they were hastily distinguished by purely local names, each consumer giving any species that name which best expressed in a popular way a leading characteristic of either bark, stem, branches, or leaves: botanists, too, working independently of each other, often gave fanciful names to trees which, though these were subsequently abandoned in most cases for others denoting a more accurate and scientific classification, still "stick on" in many districts as well as in the literature of the subject, much to the perplexity and annoyance of the student who tries to fathom the depths of this branch of the building trade. In the United States there are no less than twelve Ironwoods, sixteen Junipers, six Yellow Pines, eight Balsams, and others much too numerous to mention here, each name referring to different species, and often to different genera. Even in this list not one of the "Yellow Pines" referred to is that known as "Yellow Pine" in England, for they are what we call "Pitch Pine," and what is known as "Yellow Pine" here is "White Pine" in the States. Again, take Cedar as an example of this erratic naming of woods. Everyone is familiar with it in the ordinary pencil cedar, where it appears as a soft, even grained, reddish, highly scented wood; but in reality no less than seven different trees furnish wood known in the trade as "Cedar." First, the Cedars are divided into two classes by the trade, the "White" and the "Red"; then the White Cedar may be a Thuja, Chamæcyparis Thyoides, or C. Lawsoniana, or it may be a Libocedrus, and the Red Cedar may be a Juniper or a Sequoia. Our pencil Cedar is not a true Cedar, it is a Juniper (Virginiaana), so that a specification which provides for joiner's work of any kind to be of "Cedar" without naming the tree from which that cedar is to be obtained, is too vague to be of any value in determining the kind of wood the builder is to supply. Fir is another much-abused name: it is applied indiscriminately to spruce and pine, though it happens to be neither of them; it is something like Spruce, but it is readily distinguished from it as well as from Pine and Larch by the absence of resin ducts

in the wood and bark. All the Firs are now known as *Abies*, the Larch *Larix*, the Pines *Pinus*, the Spruce *Picea*, and the Hemlocks *Tsuga*. The hemlock referred to at the close of the last article sometimes finds its way into the London market, where it is known as "Hemlock Spruce," another example of confusion of names in the trade, for the Hemlocks and Spruces are different trees; it is imported from Canada, and sells for the same price as spruce, being graded in about half-a-dozen different qualities. The prices of "hemlock spruce" are as follows:—First quality, 3in. by 11in., £13; 3in. by 9in., £13; 3in. by 8in., £11 10; 3in. by 7in., £11 15s.; 3in. by 6in., £11. Fourth quality, 2in. by 6in., £6 15; 2in. by 5in., £6. Fifth quality 3in. by 8in., £7 10s.; 3in. by 6in., £7. Any builder who uses the hemlock for joinery will be surprised at the amount of shrinkage and twisting it will undergo as it dries in the seasoning.

TAMARAC.

Hacmatac is another soft wood sometimes imported here, but parcels of it are not very often met with on this side of the Atlantic; it is a Larch, and rejoices in an unusual number of names, scientific and popular. Amongst the scientific ones are *Larix Americana*, *L. Laricina*, *L. Tenuifolia*, *L. Pendula*, *L. Macrocarpa*, *L. Intermedia*, *L. Americana Rubra*, and in the older botanical books it is *Pinus Larix Rubra*, *P. Pendula*, *P. Macrocarpa*, and *P. Intermedia*; in these old books it is also *Abies Pendula*, and *A. Macrocarpa*. The popular names are Larch, Tamarack, American Larch, Black Larch, Juniper, Espinette Rouge, Red Larch, and Ka-neh-tens ("The leaves fall"), a name given to it by the Indians, for the trees are not evergreen. Hacmatac is, after all, only a variety of Tamarac or Tamarack, a name given to the American Larches, of which there are two species, that already referred to as *Larix Americana*, and another known as *Larix Occidentalis*. Hacmatac is, strictly speaking, the wood of the *Larix Americana*, which is a smaller tree than the *Larix Occidentalis*. Hacmatac grows in Newfoundland and Labrador. It is also found on the eastern shores of Hudson Bay. To the north-west it extends to the Mackenzie River within the Arctic Circle, and to the south by Maine and Minnesota to Pennsylvania. The American larch is a medium-sized tree from 80ft. to 100ft. high, and from 20in. to 30in. in diameter. It grows here in moist uplands; but it is found covering swamps when it is small and of poor quality. The wood is coarse-grained, hard, strong, and fairly durable, even when in contact with the soil, so that it makes good telegraph poles, fencing, and railway sleepers, though it is not much used for any kind of building except shedding and other rough temporary work.

The other Larch, "*Occidentalis*," is found locally abundant, though scattered over Washington and Oregon to Montana. It is also found in British Columbia, south of latitude 53°, and along the eastern slopes of the Cascade Mountains. This Western Larch is rather a large-sized tree, growing from 100ft. to 150ft. high, and from 36in. to 56in. in diameter, some of the largest specimens being found in the Flat Head River Valley, Montana, where this tree appears to attain its greatest development, scattered amongst other conifers, as it is never found forming forests, as other conifers do in certain districts. The wood is resinous, hard, and coarse-grained; it is seldom used for building, and its destination is usually in rail sleepers, posts, or for fuel. The popular names of this Tamarack, are Larch, Red American Larch, Western Tamarack, Western Larch, and Great Western Larch. It weighs about 39lb. to the cubic foot. The London prices for Hacmatac are—3in. by 8in. to 12in., £6 17s. 6d.; 3in. by 7in., £6 10s.; and 3in. by 6in., £6 7s. 6d.

OREGON PINE.

A wood now being gradually taken into use by builders is the bastard hemlock or spruce known as "Oregon," or British Columbia Pine. The tree which furnishes this wood also rejoices in a number of scientific and other names, its correct name, according to the most recent authority, being *Pseudotsuga Taxifolia*; it is also known as *Pseudotsuga Douglasii*, *Pinus Taxifolia*, *Pinus Douglasii*, *Abies Taxifolia*, *Abies Douglasii*, *Abies Mucronata*, *Tsuga Douglasii*, and *Tsuga Lindleyana*. Its common names are Red Fir, Douglas Spruce, Douglas Fir, Yellow Fir, Spruce, Oregon Pine, Red Pine, Puget Sound Pine, Douglas Tree, and Cork-barked Douglas Spruce. It will be seen that the wood is spruce or fir

in popular language and false hemlock in scientific language, for it bears some resemblance to the wood of all these trees. "Oregon Pine" is peculiar to the Pacific region, the *Pseudotsuga* being a genus which consists of a single widely-distributed species found nowhere but to the west of the Rocky Mountains. This tree grows to a fair size in Colorado, even at a height of 10,000ft. above the sea level; it forms extensive forests to the exclusion of all other species in West Oregon and Washington territory, in both of which districts it reaches its greatest development; in latitude it extends from British America to Mexico. "Oregon Pine" is not found in the Coast Archipelago north of Vancouver Island; hence it does not reach the 55° of north latitude. On the margin of its extreme limits north and south the trees do not attain to anything like the size of those grown in the Central Pacific Region. Under favourable circumstances, Oregon Pines grow from 200ft. to 300ft. high, attaining a diameter of from 3ft. to 10ft. and over, in parts of the Rocky Mountains it rarely attains the height of 100ft. Like all other trees, its size is determined within certain limits by the factors of soil, climate, and position with regard to other trees. The wood is hard, strong, and coarse-grained ("red fir"), or fine-grained and more easily worked ("yellow fir"); the colour of the wood is light red or yellow, the latter being the most valuable building timber. Both varieties are from trees of the same species, the difference being due more to the age of the trees than anything else. The sapwood is always easily recognised, as it is nearly white. A great objection to this Oregon Pine is that as it "seasons" it becomes flinty and hard to work, so that it is not fitted for joinery work; but for carpentry and heavy construction of all kinds it is a valuable timber, where much labour is not to be expended on it. One sawn log of this timber, 112ft. long by 24in. square, prime "three crowns," sold by auction in London last May, brought 2s. 1d. per cubic foot. Several other logs were sold, varying from 52ft. to 100ft. long, and from 14in. to 22in. square, at prices varying from 1s. 10d. to 2s. 7½d. per cubic foot, the highest-priced logs being some from 87ft. to 90ft. long, and 18in. to 19in. square, which fetched 138s. per load. The consignment was from Vancouver Island. The ordinary Oregon Pine "lumber" from Port Blakeley, Chemaines, and Puget Sound, consigned and sold as "prime, dry, unsorted," brings the following prices:—4in. by 11in., £12 10s.; 3in. by 15in., 3in. by 14in., and 3in. by 12in., £13; 2in. by 10in. and 11in., £10, all at per Petersburg standard. The same quality, 2in. by 11in. to 16in., 1s. 4d. per cubic foot; 1½in. by 12in. and 1½in. by 11in. 1s. 3d. per foot, 6in. by 12in. from 20ft. to 40ft. long, 1s. 1d. per foot. Small floated logs, from 8in. to 10in. square, and from 50ft. to 52ft. long, 60s. per load; the same sizes, 20ft. to 24ft. long, 51s. per load. The load of timber being 50c.ft., one denomination is easily reduced to the other at a glance. Log timber is usually sold by the "load," and lumber by the Petersburg Standard Hundred or the cubic foot.

SEQUIA.

Sequoia is another endemic genus of the Pacific Coast Region, where it is represented by two species, the *Sequoia Gigantea*, and the *Sequoia Sempervirens*, the first being well known, by reputation at least, as "the biggest tree in the universe." The godfathers of the big tree gave it several names in rapid succession. First, in 1853, it was called "*Wellingtonia Gigantea*"; second, in 1854, it was renamed "*Sequoia Gigantea*"; third, in 1854 again, it received the name "*Taxodium Washingtonianum*"; and the fourth and last name, given in 1855, was "*Sequoia Wellingtoniana*." It now has only one scientific and one popular name, and there is much cause for rejoicing that the number of names a tree may have is in no way proportionate to its size.

The Sequoia is the largest tree in the American forests; it is found along the western slopes of the Sierra Nevada mountains, from America River (Sacramento) in the north to the headwaters of Deer Creek on the south; it occurs in valleys and moist hollows forming isolated grooves, some of the specimens being from 250ft. to 400ft. high, and from 20ft. to 40ft. in diameter. The wood is soft, weak, brittle, and coarse-grained, yet durable in contact with soil; a cubic foot weighs only 18lb. The sapwood is narrow and white, thus contrasting with the heart-

wood, which is a clear red that gradually darkens on exposure to light. This Sequoia is not a good building timber for carpentry or joinery. In the States it is converted into lumber, fencing, shingles, &c. Sequoia Sempervirens (syn. Taxodium Sempervirens and Abies Religiosa) is a much smaller tree than the Gigantea: it grows to heights of from 200ft. to 300ft., with diameters of 8ft. and 21ft. respectively. The greatest development is attained in wet situations on the borders of streams, and it gradually dies

out on hillsides and other dry situations. This tree is limited to the coast ranges of California, extending 30 or 40 miles inland from the southern boundary of Oregon (42°) to that between Monterey, and St. Louis Obispo Counties in latitude 36°. This wood is like white cedar, being light, soft, brittle, easily split, and easily worked; the colour is a light red, which turns to a brownish red on exposure; a cube foot weighing 26lb.; the sapwood is easily recognised as it is nearly white. This sequoia is the pre-

vailing architectural timber on the Pacific Coast in California, where it is also used for sleepers, telegraph poles, wine butts, coffins, &c. Report says that this wood with curled or contorted grain is highly ornamental. The writer has used a good deal more of this timber than he will ever use again, and any he has ever seen was either straight-grained or grainless, so that the curly and contorted varieties which take a high polish will have to come along yet, that is, if any trees are left, for the Californian

forests of this wood are being rapidly converted into lumber. Sequoia may be dull-polished with white beeswax dissolved in turpentine, or highly-polished by using ordinary French polish. Clear polish leaves the wood its natural colour. Sequoia may be varnished by first using a filling of white shellac, which should be sandpapered down when dry, after which two coats of good white varnish will give the wood a glossy surface. If each coat of varnish is rubbed down with pumice and oil, and four coats are given, a high polish will result. Sequoia is not likely to become a popular building timber here. It is a dead kind of wood on the bench, and has nothing to recommend it but its colour, which is darker than ordinary pencil cedar. The accompanying sections of Russian and Finnish deals may be compared with those in the last article, showing Oregon Pine and Canadian woods, the latter having a general tendency to run into much coarser grained timber than the former. The twenty-one sections given here will be described fully in an article on the growth of trees in height and diameter.

ACADEMY ARCHITECTURE AND REVIEW.

THE volume which Mr. Alex. Koch has just published in illustration of the architectural drawings at Burlington House is a capital one, including many of the more important exhibits, though we miss several which ought to be included to make this publication really representative of the show as a whole. A second volume will appear towards the end of the year, so that these omissions possibly will be made good. The book includes many rejected contributions from the Academy gathering. All are clearly and well reproduced. About double the space in the volume to that accorded to the Academy Architecture in this way is occupied by works from the Royal Scottish Academy Exhibition at Edinburgh, and from the Institute of the Fine Arts, Glasgow, as well as sculpture from the Royal Academy. Thus considerable variety is insured, greatly to the advantage of the collection of plates, some of which are in colour, giving interiors by foreign architects. The Architectural Review part of the little folio is devoted to photographs and sketches of work from the Continent, ending with a competition design for Cape Town University by the editor. The plans in the volume increase its utility. The advertisements are copious, a few being interspersed between the divisions of the publication, rather spoiling its character. The work has now reached its fifteenth year of publication, and Volume XXIII. Its price is four shillings net in paper covers.

PAINTS, COLOURS, OILS, AND VARNISHES.*

A USEFUL little handbook has just been published by Scott, Greenwood, and Co., 19, Ludgate-hill, under the above title. The author, Mr. John Farnell, manufacturing foreman and lecturer on the manufacture of painters' oils, colours, and varnishes, at the Polytechnic, Regent-street, writes, with a view to give "first-year" students engaged in the study of the manufacture of oils, colours, and varnishes at the various technical classes, an opportunity to grasp the ordinary grade course with a view to their qualifying themselves for prizes and certificates offered by the City and Guilds of London Institute's examination. Mr. Farnell is an old student, and his book will be found of service by those who are deficient in chemical knowledge, without which little progress can be made. The student is required to "read carefully, and do the practical work set forth in these pages," and to write out fully all work done and answer the questions set. For those who wish to occupy the better appointments in laboratories and factories, the volume can be recommended. We can only scan over the sections of the book to show its scope. The first section illustrates and describes the plant required for making lemon and middle chromes. Various pigments are produced by precipitation, and a home-made plant is suggested made out of barrels and pipes, and this is clearly illustrated. Section II describes the weighing up the ingredients for making chromes, such as

bichromate potash, soda crystals, sulphate soda, water, placed in one barrel. Steam is admitted slowly to dissolve the two chemicals. In the next barrel is placed acetate of lead, and water and steam admitted to dissolve it. When cold, the solutions are run out together into another vat, and the chemical action results in chromate of lead or lemon chrome. Other laboratory processes are described and illustrated for other chromes. The mills for grinding the colours are fully illustrated. In like manner the plants necessary for making Chinese, Prussian, and other blue pigments, greens of various kinds, earth pigments like burnt and raw sienna, umber, ochres, &c., brown and black pigments, reds and lakes, white pigments, &c., are fully described. The later sections describe white, painters' oils, adulterants, also deal with turpentine, oil, and spirit varnishes, liquid and enamel paints. The last section gives a series of questions for students who desire to compete for prizes and certificates. These require the student to describe the plant necessary for making various pigments, and the manufacture of the different shades and hues. Some practical questions are given, as how to prepare a paint suitable for a new wood. The work is well illustrated, and its price is 2s. 6d. net.

PRESERVATION OF STEEL IN STRUCTURES.

AN official report on the preservation of structural steel in a late New York building, the Pabst Building in that city, is given in the *Engineering Record*. The steel was exposed during the demolition of the structure, and was under constant examination by engineers of the Department of Buildings. Numerous photographs were taken of different parts. The data furnished have been made the subject of a report by Mr. Jas. P. Whiskeman, Assoc. M. Am. C. E., to Mr. Perez M. Stewart, superintendent of buildings. In the upper stories the steelwork was found in excellent condition. Slight quantities of rust were found, chiefly at connections in the vicinity of the elevator shaft, and where the columns were inclosed with brick instead of being flushed with mortar. In the lower parts of building the corrosion was greater. The building was 108ft. high, 25ft. wide, and 54ft. long. The first story walls were of iron, the second story of limestone, and the upper stories of brick, supported by Z bar columns at each floor. The Roebling system A, type 1, with suspended ceiling, was used for the fire-proof floor arches, and the interior partitions were of expanded metal channels and a patent plaster. The outer walls were furred on the inside with hollow bricks, and the interior columns incased in hollow terracotta blocks. The columns rested on cast-iron bases resting in the rock, others were carried on grillage beams. The steelwork, before leaving the shop, was cleaned of scale rust and dirt, and given one good coat of pure boiled linseed oil, worked into all joints and open spaces. Pins, pin-holes, machined surfaces, were coated with pure whitelead and tallow. The contact surfaces, in riveted work, were specified to be painted before riveting, and two coats of paint were to be given to pieces not accessible after erection. After erection all, excepting the structural work, was to have one coat of paint mixed with pure linseed oil. Grillage beams were to be covered with a coat of liquid asphalt before setting in place, and other structural work was to receive one coat of "Nobrae" before leaving the shops, and after erection an additional coat of the same paint. The work was begun in October, 1898, and finished in about a year, and was constructed in accordance with plans submitted to the department by Henry F. Kilburn, architect. Snowstorms and severe weather were experienced, and delayed the steelwork for some time. In December, 1902, removal of the structural steel was commenced. The expanded metal and channels in the partitions were badly rusted, and the patent plaster seemed to aid the rusting. In the basement floor the ceiling rods had rusted away, and the arch centring was also rusted where exposed. Over the refrigerators in the sub-basement vault the rods holding the ceiling had completely rusted out and the ceiling was ready to fall; the wire cloth had gone, but the concrete floor arches at these points were not affected by the rusting of temporary centring, but remained strong. The boiler stack of 4in. and 6in. sheet steel covered with asbestos, held by galvanised wire mesh imbedded in it, was covered by rust. It was probably painted with a mineral paint which the heat had reduced to dust. The

following examples of corrosion of the structural steel are given, but these are exceptional. The interior beams, girders, and columns above the first floor were, as a rule, free from corrosion, although little patches of rust were found along the outer edges of flanges of beams, probably not well painted, or along the webs of the beams where the paint was scraped off on ramming the concrete. The drying out of the concrete would then cause such rust. But these patches were slight. At the connections of columns and girders the outlines of the angles could be seen in rust. Corrosion was more extensive on the inner side of the webs of the channels forming the elevator framing where unprotected. The wall columns and girders were most affected on the north side, and on the fourth and sixth stories there was more corrosion than above or below, probably due to imperfect coating. Other girder webs were badly rusted, and it is thought that this is probably due to the fact that these rusted points on the web contained the shop-marks and were never painted; but some columns and beams on the first story were in good preservation. The connections were found badly corroded. The cast-iron columns in the basement and vaults were in an excellent state, although the girders next were rusted; but these columns were covered with ordinary lime mortar held to the column by galvanised wire mesh. Other parts of the structure are described in the *Record*, to which we are indebted, and the photographic illustrations help to explain the results. The conclusions to be drawn from these observations are that the preservation of steel depends mainly on the protection afforded by paint, or the encasing of members in concrete or lime mortar, and that steel can resist oxidation when these protective coverings have been thorough; that paint is not always reliable in damp walls; that cast iron withstands rust better than steel. The facts recorded show that the connections of iron and steel are most liable to be attacked by rust, and these should be well painted or covered with a material like cinder concrete. All the unpainted steel-work, tie-rods, hangers, and expanded metal were found rusted more or less, and also the angles and flanges of girders, showing that the paint had in many cases been rubbed off, or had not been coated after fixing. Considerable care and supervision is necessary in seeing that the specified coats are applied. The splice plates of columns are often found to have rusted behind, caused by scraping, or the paint had been rubbed off, so with heads of rivets, which are often rusted before the flanges and webs. These are matters that require very careful inspection. All machined surfaces, pinholes, riveted work should be painted or coated with pure white lead and tallow, and after erection another coat of paint is necessary, or boiled oil should be worked into all joints. As a matter of fact, these finishing operations during erection often leave the steel surfaces bare, and nothing is done in the way of repainting.

CEMENT JOINTS IN DRAINS.

IN his remarks on the above subject, Mr. James D. Armstrong, Prof. Assoc. Surveyors' Institution, gave some useful advice, which we noticed last week in connection with the late conference at Bradford. The quality of the Portland cement is important. The author says: "It should be tested for contraction, expansion, adhesion, disintegration (by boiling for 24 hours after joints have been made for 24 hours). Specific gravity should be about 3.1. Weight per bushel is an unreliable guide—also whether it contains free lime or gypsum; then further for tensile strain, which should not be less than 500lb. per square inch, at seven days. The briquettes being mixed up as stiff as possible, are "thumbed" into the mould. And lastly, but not the less important, its fineness, 80 per cent. of which shall pass through a sieve having 32,400 holes per square inch, and the whole through a sieve of 2,500 holes per square inch." The use of hot lime for foundations is not recommended, on account of expansion. Cement only should be used. The trench excavated is often much too narrow, and the pipes are often laid and jointed without sufficient care;—the inspector is in a hurry, and gives orders to "fill in" before the work is looked at, the trenches are filled up, and the soil rammed down. The consequence of this haste is shaken and broken joints. Can such joints ever hold water? The only cement joint that will stand satisfactorily the water test is this—i.e., the cement

* Student's Handbook of Paints, Colours, Oils, and Varnishes. By JOHN FARNELL. London: Scott, Greenwood, and Co., Ludgate-hill.

should be keyed at both ends, the whole space in the joint being filled in with cement without gaskin or other material, and no sand should be used. The most important point at which the joint should be perfect is between the end of the spigot and the bottom of the socket—a fact overlooked by many engineers, who specify gaskin, &c. When the socket and spigot touch, the surfaces should be unglazed, so as to form a natural "key" for cement. If, from careless stacking in the kilns the ends are glazed, they should be chipped to give a "key" to the cement. The remarks on these and other points are worth noting by all engaged in laying pipes or inspecting the work.

BRICK PAVING IN IOWA.

THE paving brick committee of the Iowa Engineering Society, after two years of painstaking investigation of its special subject, made a report at the annual meeting of the society held at Cedar Rapids in January, 1902, which report, together with the discussion it elicited, has recently been published in pamphlet form. It contains complete and detailed information not only regarding practically every yard of brick pavement in the State of Iowa, but also such allied information as the cost of asphalt, macadam, and other pavements in the cities where brick is used. It was originally proposed that the committee, which is composed of Professor A. Marston, Ames, Ia., chairman, and Messrs. C. R. Allen, C. P. Chase, C. S. Magowan, and Wm. Steyh, should prepare a set of standard specifications for brick paving; but this was not done, it being thought that on account of the variation in local conditions it would be better to present the entire data, and let each engineer draw his own conclusions.

The results of the investigation show how very important brick paving is in Iowa in comparison with other pavements. The cedar block pavements formerly laid in some of the larger cities have in every case proved unsatisfactory, and many of them have already been replaced with brick. Cedar Rapids, in reply to the question as to whether brick had proved satisfactory as compared with other pavements, says: "It is much better than cedar blocks, of which we have had plenty, but not as satisfactory as we would like." Macadam has been laid extensively in some places, due mainly to its cheapness, and occasionally it has been used later as a foundation for brick. At the present time there is also a strong tendency in Iowa to construct asphalt pavements on residence streets, where financial considerations permit, and where well built these pavements have proved satisfactory. Nevertheless, by far the greatest area of paving in the State has been of brick, and brick will probably continue to be the main pavement of Iowa in the future. The returns from 23 cities and towns gave as totals:—4,030,696 square yards of brick pavement, 192,884 square yards of asphalt, and 364,937 square yards of wood-block pavements in the state.

Some of the general results of the investigation may be summarised as follows:—Horseshoe wear on the brick pavements has been found of more consequence than the wear due to wheels. The general opinion seems to be that re-pressed bricks are the best, though some city engineers thought not. There seems to be no marked preference for either end or side-cut bricks; but it is generally considered that round-edged bricks wear better than the square-edged ones. Concrete is considered the best foundation, but this depends much on the location. The majority of the cities prefer a 1½ in. or 2 in. sand cushion for the bricks, although it varies from 1 in. to 5 in. There are so many different recommendations for determining the cross-section of the roadway that it is impossible to draw any general conclusions. An exposure of 6 in. to 8 in. of the face of the curb is recommended, and it is not as a rule considered worth while to point curb-joints with cement mortar. The curbs are generally set on sand. The combined concrete curb and gutter has not been much used in Iowa, but is considered to be very good. Occasionally there was some heaving due to severe cold weather, and in a few cases rumbling of the pavement was noticed at the same time; but as a rule such results were not noticeable. Several engineers recommend a special brick for use along street railway tracks.

In the report of the committee there are given typical cross-sections of the brick pavements in all of the principal cities of Iowa and as much of the information as possible has been compiled into

a table. In that tabular statement the cost of the round untreated cedar block paving in Sioux City is given as 1'33dol. per square yard, there being 213-437 yds. in the city. In Council Bluffs the cost is given as 1'40dol. to 1'59dol., there being 152-500 square yards in that city. The cost of limestone block in Burlington is given as 1'25dol. per square yard, and granite block as 2'75dol.

The committee calls especial attention to the subject of foundations. At the present time, leaving out of account the brick paving successfully constructed upon macadam foundation, there are two kinds of pavements from which selection would usually be made. These are the single course of brick on concrete foundation, and the two-course brick pavements. The two-course pavement was the form first adopted, and will still usually be cheaper to construct than a pavement with a concrete base. The exact difference in cost will vary with local conditions, such as, for example, whether a cheap local brick can be obtained for the under course, and whether materials for concrete are abundant, cheap, and of good quality. The opinion of engineers seems to be usually in favour of the pavement with the concrete base; but where the soil under the pavement furnishes a good, hard, dry foundation, and where the traffic is not too heavy, the two-course pavement has given good satisfaction. Concrete is required wherever there is any doubt as to the character of the soil foundations, and wherever the traffic is excessive. Concrete bases for brick pavements in this state seem universally to be constructed of natural cement in the proportion of 1:2:4, 1:2:5, or 1:2½:5. Mr. E. C. Blake, of Dubuque, raises the question as to whether it would not be better to use Portland cement concrete in a somewhat weaker mixture.

The question of filler is another important subject in connection with brick pavements. A large amount of sand filler is still in use. Most engineers express their preference for a Portland cement filler, but the additional cost is against it. In the few cases in which comparative figures were given, the additional cost of the Portland cement filler seems to range from 4 to 18 cents per square yard. The general proportion for filler seems to be 1:1 or 2:3. The advantages of the cement filler appear to be in providing a support for the edges of the brick, which prevents their chipping, and also in rendering the pavement impervious to water. Its disadvantage, aside from the cost, seems to be the rigidity given to the pavement.

Another important question is the matter of the curbs. The use of stone curb is still very extensive throughout the State. Trouble seems often to be experienced with limestone for curbs, but no complaint has been made of sandstone. However, the use of cement curb is also extensive, and the cost appears to be materially less than that of the stone curb.

Another very important question in connection with brick pavements in Iowa is the extent and causes of failures. Although brick has been used very extensively for ten or twelve years, very little has yet been done to the streets in the way of repairs. This is in spite of the fact that at the time the first pavements were put down the subject was not well understood, and the materials used were not nearly so good as at present. No one can yet predict with certainty what will be the limit of life of brick pavements. Where failures have occurred they can usually be attributed to too soft brick or to poor foundations.

This subject of the injury to pavement from the construction of trenches appears to be the one point with which all places have trouble. Extensive work has been done by Prof. Edw. J. Orton, jun., of the University of Ohio, at Columbus, for the National Brick Manufacturers' Association in connection with the subject of paving brick tests. This association a few years ago recommended specifications for a standard test which has since been known as the N.B.M.A. test. This method of testing was afterwards subjected to considerable criticism, as it did not properly discriminate against the soft brick. Prof. A. N. Talbot, of the University of Illinois, developed and advocated a method of testing in which the charge was composed partially of brick and partially of cast-iron cubes and brick of different sizes and weights. This met the objection to the N.B.M.A. test, and was provisionally adopted in preference to it. Still another form of rattler test was proposed about this time by Mr. Gomer Jones, of Geneva, N.Y., in which

the bricks were to be fastened to the rattler and revolve with it, the charge of cast-iron remaining free in the centre to fall upon and abrade the brick. All these forms of rattler tests were further thoroughly investigated by Professor Orton.

On August 1, 1901, a commission of engineers met the committee of the National Brick Makers' Association, having this matter in hand, to pass upon the results. The commission of engineers included the late Professor J. B. Johnson, of the University of Wisconsin; Professor A. N. Talbot, of the University of Illinois; Professor W. K. Hatt, of Purdue University; and Professor A. Marston, of the Iowa State College. As a result, the committee made, and the National Brick Manufacturers' Committee adopted, a recommendation to the effect that the standard specifications for rattler tests of paving brick should be the so-called Talbot test, in which the charge is composed partially of paving brick and partially of cast iron. The paving brick committee of the Iowa Engineering Society adopts these specifications, and recommends, regarding the allowable limits of rattler losses for good paving brick, that until more data are secured, a maximum allowable loss of 25 per cent. would be reasonable.

No amount of testing can, however, do away with the necessity for a close inspection of every load of brick used on the work.

A BOOK OF COUNTRY HOUSES.*

THE volume which Mr. Batsford has just published, giving a folio of plans and views of houses built from the designs of Mr. Ernest Newton during the past ten or twelve years, recalls several examples which we have seen elsewhere, and it can hardly be said that any of the houses chosen for illustration present any specialised novelty or individuality of treatment, though no doubt they illustrate much that is common to the better class of moderately-sized English modern houses designed by architects whose names have been associated with this style of building. The plans are given to a good scale, and the most successful of the plates are those reproduced from photographs. The author does not wish his book to be thought a collection of specimens, and, above all, not to be taken as a volume of examples to be copied by others. The sale of such publications, however, largely depends upon their being used as pattern books, and the idea of securing clients is covered by the neatly expressed hope that the houses thus put forward may be found suggestive perhaps not so much to brother architects as to the house-building public. Books of this scope too have appeared from time to time with more or less success for very many years, and it remains to be said that Mr. Newton's nicely got up folio is quite as good as any that have gone before. He is free of the Art and Crafty tricks in house building, which he calls "Freak Architecture," breaking away as it does, in the chase after originality, from the normal lines of natural development which naturally comes about by using materials in a reasonable and appropriate fashion without attempting to ignore their idiosyncrasies. The perfunctory enthusiasm of the "New Art" finds little sympathy with Mr. Newton, though he uses these words somewhat tenderly, in respect to the extravagances of the school to which he himself belonged years ago. It was a school, however, which originated with a genuine desire to mend matters in domestic buildings, and, thanks to the lead of Nesfield and Norman Shaw, did reform the whole system of house planning in England with the utmost advantage, though there still remains a vast degree of improvement to realise. Mr. Newton urges the use of local materials, and generally his designs appear to be done in brick and tile. Some are in roughcast, and one or two in stone. We doubt the beauty of diapered mural chessboards, square and diagonal, as in type of house No. 8. Numbering the samples in this way emphasises the idea which the author says he does not mean. Some of the interiors are rather good, the best being perhaps the staircase of house No. 8, with its simple inlay and moulded balusters. We much prefer it to the more ambitious work shown in specimen house No. 9, which externally has a Georgian look with big plain chimneys. This book calls for little comment really, and to criticise the plans would serve no good purpose. The kitchens are generally well isolated, and there

* A Book of Country Houses (sixty-two plates of nineteen houses). By ERNEST NEWTON. London: E. T. Batsford. Imp. quarto. Bound, 21s. net.

is in most cases a good hall and a commodious stairway, plenty of bay windows, and the fireplaces are well placed in respect to the doors and windows of the rooms in which they are situate. The book is well produced, and will doubtless find a ready market.

WATERWORKS ENGINEERS IN CONFERENCE.

THE members of the British Association of Waterworks Engineers are holding their annual conference in Bolton during this week. There are meetings each morning for the discussion of more or less technical subjects, and the afternoons are being spent in visiting the more interesting works of the neighbourhood. The conference was opened on Tuesday morning in the council chamber of the town-hall, when the Mayor of Bolton (Mr. Alderman Miles) gave the delegates a hearty official welcome. The president for the year is Mr. R. H. Swindlehurst, the engineer of the Bolton waterworks.

Mr. Swindlehurst, in his presidential address, spoke of the growth of the Association, which now contains 286 members, or 24 more than in the previous year. The great value of the Association lay in the opportunity it gave, through the reading and discussion of papers, of the interchange of knowledge and ideas on points of practice. The duties of the waterworks engineer, if carried out aright, had a most important bearing upon the improvement of the health and prosperity of the people. Statistics showed clearly that the expenditure on the improvement of the water supply in the larger towns had resulted in a saving to the community, and no one could fully estimate the benefits conferred on our crowded centres of population by the introduction of a pure and abundant water supply. In spite of this, the difficulties and opposition met with when such schemes were mooted were often very serious, and the public needed to be shown that money expended on the improvement of the water supply was a good investment, and that it was to their own interest that the works should be of the best and most perfect description. Going on to deal with questions affecting variations of the rainfall in different districts and methods of filtration, he said that of course the purity of a water supply was a matter of the highest importance. Although it was true that waterworks engineers succeeded in making good and effective filter-beds long before they knew anything at all about microbes, it must be admitted that recent researches in the domain of the bacteriologist had helped the engineer to a better and more thorough knowledge of what he was about, and had emphasised in a remarkable manner the necessity of filtration being carried out in an intelligent, systematic, and scientific manner.

Mr. Swindlehurst was thanked for his address. Afterwards Professor S. Delcigne, of the Owens College, read a paper on "Protection of Gathering Grounds and Filtration Compared." He reviewed in detail the evidence in support of both methods, and arrived at the following conclusions:—That filtration of unpolluted water is unnecessary as a protection against disease, and in the case of polluted water is not always an absolute safeguard. To make filtration efficient, both constant skilled supervision and considerable expenditure are necessary. Protection against pollution is a sufficient safeguard against disease, and the initial expenditure is not unusually very large. The supervision of depopulated gathering grounds requires no special skill or large permanent expenditure. "When expense is not a matter for consideration, the best results are obtained by a combination of protection with well-conducted filtration; but whenever expenditure makes it a matter of necessity to choose between filtration and protection, I have no hesitation in saying that protection is better than filtration, which is really equivalent to saying that prevention is better than cure."

In the discussion which followed, several members argued in favour of filtration as against the acquisition and protection of watersheds.

The meetings were resumed, at the town hall, Bolton, on Wednesday, the President, Mr. R. H. Swindlehurst, occupying the chair. The final report of the committee appointed to consider the question of the standardisation of cast-iron pipes recommended in order to secure the universal adoption of any given standard, that it would be desirable to limit the number of sizes standardised to those in common use in this country, and the

number of classes for each size to be three or less. They did not consider that the metric system of measurement could be conveniently adopted at the present time in place of the existing standards. In the opinion of the committee the next step to be taken was to refer the whole matter, including their own suggestions, to the engineering standards committee. The report was adopted. "The Raising of Water from Deep Wells and Borings by Compressed Air" was the title of a paper contributed by Mr. W. H. Maxwell, of Tunbridge Wells. In 1900 Mr. Maxwell installed an air-lift pumping apparatus at the Tunbridge Wells Waterworks, and the plant has since been in constant use. Referring to the cost of the scheme, the paper stated that during the earlier months of this year, with water levels varying between the depths of 98ft. and 118ft. below the surface, under regular working conditions, the full cost came out at a fraction under one penny per 1,000 gallons raised. Mr. Hodson (Loughborough) said that the fact that 80 per cent. more water was raised than by any other system was a great advantage in favour of the compressed-air plant. The secretary (Mr. Griffith) said the whole matter was in a condition which attracted great interest, but fuller and more careful experiment in the matter was absolutely necessary. A vote of thanks was accorded the author of the paper. In the afternoon the members visited the local waterworks, and in the evening the annual dinner was held.

THE CAMPANILE OF ST. MARK—DISCONCERTING DISCLOSURES.

IT is one thing, writes the Venice correspondent of the *Scotsman*, to say that the state of the foundations of the campanile of St. Mark's Church had nothing to do with its fall; it is another thing to say that their state is such that a new campanile may safely be built upon them. The first of these statements has been made over and over again on the authority of the engineers in charge of the works, of the Royal Commission appointed to report upon its fall, and on the authority of the present writer, who saw with his own eyes the causes at work that brought about the fall, and saw the foundations after the fall to be exactly what they were before it. That statement therefore stands incontrovertible. The second statement one naturally feels inclined to make as an inference from the first. If the foundations have not been affected, why not build upon them? If they carried the weight of the old campanile, they can carry the weight of the new. Reasoning in that way the second statement was also made, and asserted on the authority of those in charge, and as an observer's own personal opinion. That the old foundations were considered fit to bear the new campanile, and that the intention of all concerned was to build the new campanile on them, is proved by the fact that the first stone of the new campanile was actually laid upon them by the Count of Turin on St. Mark's Day, April 25.

Now, however, it turns out that the data on which the second statement was grounded were altogether insufficient. The foundations that seemed to justify it were the few courses of large, well-dressed, and well-placed stones that were visible above the level of the pavement of the Piazza of St. Mark. But what of the foundations lower down? What of the building that goes down from the level of the Piazza to the oak platform on the top of the piles, a distance of 12ft.? That was never thought of, apparently. Now, however, a trench 12ft. deep and 9ft. broad has been cut round and round the campanile—that is to say, the foundations are now laid bare from top to bottom, and the sight is not a little surprising. To-day, July 18, I have had the opportunity of carefully examining them. The courses of stones below are not like those above—they are composed of smaller stones and of unhewn stones. Not only so, but they are not too carefully laid. Further, the lower they are the worse they are. Indeed, when they were laid they had not the means of keeping the water out, and so they were thrown down, apparently, in hot haste. The lower row, that resting on the oak platform, is very irregular. At the north-west angle there is an enormous stone, but it is in form like a right-angled triangle, and, strangely enough, its acute angles are turned inwards, so that the weight of the building inside has pushed it outward. Then,

again, all the stones are Istrian sandstone, and, therefore, liable to absorb water and to disintegrate. Again, when the foundations were laid they had not cement, they had not hydraulic lime, and so the lime used was simply common lime mixed with sea sand. The result is that the salt water has percolated through and through all the foundations of the campanile, below the level of high-water mark, which is the level of the Piazza, and has disintegrated the mortar and washed it out. As the tide falls in the lagoons, the water trickles all through amongst the foundation-stones, running in little streams in places. Again, the foundations of the campanile have a list towards the Doge's Palace. This, at the level of the pavement of the Piazza, is nine centimetres, or 3½ in., which is not much; but as the tower ascends, it would amount to a great deal. Once more, hydraulic lime will not attach itself to ordinary mortar. There would be difficulty in uniting the old with the new. Lastly, the foundations are split from top to bottom where the door of the campanile was. Of the piles and platforms no one can speak with absolute certainty. The ends of the oak platforms which I saw seemed in good condition, but they were covered with mud, and water was trickling all over them. The piles, which are of poplar, are not long—6ft. only—and, so far as they have been seen, are in good condition; but one cannot judge the state of the whole from the state of two or three. The result is that a serious difficulty has arisen. Engineers, and architects, and builders too, think it madness to rebuild on such foundations. They have done their work for a thousand years, and now fresh foundations are wanted. But all was arranged. The cost of reconstruction calculated; Government Bill passed arranging subsidy; the first stone of new campanile laid by Royalty; and now all has to be redone. The cost of dismantling and rebuilding the foundations will not be less than quarter of a million pounds sterling.

CHIPS.

In the case of the application on behalf of Walter Ford (described in the Receiving Order as W. Ford), Hollybush-street, Barking-road, Plaistow, E., builder, the order of discharge has been suspended for two years ending June 18, 1905. A similar order of suspension for two years has been made in the case of Eliezer Howson, Lincoln, builder and contractor.

The mining village of Skelmersdale, a few miles from Liverpool, has been without a church for about five years, the one that was erected in the 18th century having become dangerous, owing to colliery operations. Earl Latham, who is Provincial Grand Master of West Lancashire, on Monday laid the foundation-stone of the new church on a site adjoining that of the old one, with full Masonic ceremony.

The burgh council of Oban have resolved to instruct Messrs. D. and C. Stevenson, C.E., of Edinburgh, to prepare working plans and specifications for the works connected with a new intercepting sewer.

On Sunday the Very Rev. Canon Crawley, V.F., of Sale, laid the memorial stone of a new infants' day-school in connection with St. Edward's Catholic Schools, Runcorn. The new school, which is in course of erection from the designs of Mr. Edmund Kirby, of Liverpool, will provide accommodation for 130 children, and the total cost will be about £2,000.

The St. Marylebone Guardians were informed at their last meeting that the infirmary committee had obtained a report from Mr. A. Saxon Snell, F.R.I.B.A., on the drainage at the workhouse infirmary. He advised the relaying of the whole of the external drainage, which was found to be in a very leaky and defective condition, with metallic pipes. It is estimated to cost about £5,000. After discussion it was decided that Mr. Saxon Snell should carry the work through.

A return issued by the London County Council shows the addition to labouring-class accommodation provided in 1902. The total estimated number of persons provided for has been 72,140, of whom 33,418 were in districts north of the Thames, and 33,722 in districts south of the river. The estimated net increase of persons for whom accommodation has been found is 65,671, of whom 31,911 were north of the Thames, and 30,760 on the south.

Plans prepared by Mr. Humphries for the drainage of Hungerford have been approved by the urban district council. The scheme provides for the treatment of the sewage in septic tanks and bacteriological beds, the effluent to be passed over land. The total cost is estimated at £8,166.

BOOKS RECEIVED.

Holidays in Eastern Counties is the title of the latest handbook issued by the Great Eastern Railway Company, whose enterprise in making known the rural beauties and historic associations of the extensive district they serve deserves the reward it is gaining in an ever-increasing influx of tourists and holiday-makers. The little book is brightly written by Percy Lindley, very fully illustrated, and gives prominence to some of the less known districts in East Anglia. A useful feature is a list of the golf-links in the Eastern Counties. An agreeable feature of the work is the freedom from more or less artfully concealed advertisements.

CHIPS.

Mr. R. H. Becknell, an inspector under the Local Government Board, has held an inquiry at Scalby into an application of the urban district council to borrow £5,183 for works of sewerage.

A stained-glass window has been placed in St. Giles's Parish Church, Willenhall, in memory of Mrs. Mary A. Gough. The design represents "The Adoration."

Dunnottar Parish Church, Stonehaven, N.B., has been recently reopened for public worship after having been almost entirely reconstructed from the designs of Mr. G. P. K. Young, A.R.I.B.A., Perth.

Messrs. Graham, Morton and Co., Ltd. are building a large complete new engineering works in Hunslet, Leeds. The works comprise three large bays 50ft. span over 400ft. long, together with engine and boiler-house, &c., and other outside buildings.

Colonel W. R. Stacke recently held an inquiry at the town-hall, Great Yarmouth, on behalf of the Local Government Board into the application of the Town Council for a loan of £825 on account of underground conveniences to be erected on Hall Plain, and £550 for widening High-street, Southtown.

The town of Radcliffe, near Bury, Lancs, has just been presented with a convalescent hospital. It is the gift of Mr. Adam Crompton Bealey, a manufacturer of the town. The building and furnishing of the Bealey Memorial Convalescent Hospital have cost £7,000, and the endowment is about £21,000.

A new organ, built and erected in the Otley Parish Church by Messrs. Abbott and Smith, of Leeds, at a cost of over £1,100, was dedicated on Tuesday by the Bishop of Beverley.

The city corporation of Manchester are about to widen the streets around the infirmary. In Piccadilly the pavement will be carried back opposite to the Queen Victoria memorial statue, and also opposite to the Peel and Wellington statues. This will give a straight line of thoroughfare along Piccadilly, making the whole roadway 56½ yards wide at the Market-street end, and 47½ yards wide at the London-road end. There will be a considerable widening of Portland-street and George-street. The scheme will provide needed room for working the city tramway service, which is still growing.

Under the title of Ingram Houses, Limited, a company has been formed under the auspices of the Bishop of Stepney for building lodgings for clerks employed in city offices and warehouses. A freehold site has been bought at Stockwell for £11,500. The proposal was to erect on this site a building which would cost £40,500. This cost has now been reduced to £30,000; and the building will be capable of giving 200 young men and lads a private room and the share of large common rooms for food and recreation.

The Dean of Hereford has issued an appeal for £5,000 towards the rebuilding of the west front of the nave of Hereford Cathedral, after designs by Mr. J. Oldrid Scott, F.S.A., and states that a further sum of £5,000 will be required later on for the front of the side aisles.

A new reredos has recently been placed in the Lady-chapel of the church of St. Petroc Minor, Cornwall, as a memorial to the Rev. Hildebrand Barker, late rector of the parish. It has been designed with the altar by Mr. J. N. Comper on strictly English lines. Four pillars, with eight burning torches, stand at the four horns of the altar supporting side curtains of silk; there is no gradine, as in most Continental churches, but the two candlesticks stand directly on the table. The reredos, which is coloured and gilt, contains figures of the Blessed Virgin and SS. John the Evangelist, Petroc, Francis of Assisi, and Antony of Padua.

A memorial is to be erected on a public site at Berwick by Sir Hubert Jerningham, ex-Governor of Trinidad, in memory of his wife, Lady Jerningham. Mr. Ingram is to be the sculptor. The work will take the form of a recumbent figure in marble of Lady Jerningham with a bound on each side, and a drinking trough will be placed in front in further recognition of her love for dumb animals.

OBITUARY.

Mr. JAMES ABBOTT McNEILL WHISTLER, the erratic impressionist etcher and portrait painter, who died on Friday at Cheyne-walk in his sixty-ninth year, will be longest remembered for his success in the gentle art of making enemies, which he so assiduously practised. His overweening vanity induced a super-sensitiveness, which resulted in his bringing the well-remembered libel action against Ruskin, when a too-sympathetic jury awarded excessive damages in the form of one farthing. His reign as President of the Society of British Artists was brilliant but brief, and he was succeeded by an artist of more solid qualities in Sir Wyke Bayliss. Whistler's best portraits were undoubtedly those of his mother, now hung in the Luxembourg, and of Carlyle, for which the Glasgow Corporation, with many regrets, parted with £2,000, and secured thereby a cheap bargain. Architects will recollect that in 1888 Whistler married the widow of E. W. Godwin, an equally erratic and brilliant draughtsman, talker, and writer. Mrs. Whistler, who died five years ago, and was the daughter of J. B. Philip, the sculptor, left no issue by either marriage.

With great regret we announce the death of the senior partner in the well-known firm of Archibald Smith and Stevens, of Janus Works, Queen's-road, Battersea, Mr. J. S. STEVENS, of Poundfield, Old Woking, on the 15th inst. No changes arise in connection with the business, which will be conducted as heretofore by the surviving partners.

Mr. BENJAMIN EBENEZER NIGHTINGALE, the well-known builder and contractor, of Albert Works, Albert Embankment, S.E., died, we regret to hear, after an illness of some months' duration, on Friday in last week, the 17th inst., at Richmond, Surrey, aged sixty-six years, and was buried at Norwood Cemetery on Wednesday. Mr. Nightingale, whose portrait was given in our issue of June 13, 1896, had been in business in Lambeth for eight-and-forty years, and for the last 47 years at Albert Works. Among his principal works were the New Council Chamber, Guildhall, and Leadenhall Market, both from the designs of the late Sir Horace Jones; St. Olave's Rectory, S.E., the latter from the designs of the late Ewan Christian; monasteries and a church planned by the late John F. Bentley; new board offices at the Stationers' Hall, under Mr. Robert Milne; the chapel at the Consumptive Hospital, Brompton; Centenary Hall at the Royal Masonic Institute for Girls, Battersea Rise; St. George's and St. Giles's Workhouse, Bloomsbury; the Birkbeck Literary Institution, and Messrs. Burt's printing premises adjoining; Homerton Workhouse Infirmary; additions to Leavesden Asylum, for the Metropolitan Asylums Board; numerous churches, including St. George's, Catford; Emmanuel, Harrow-road; St. Andrew's, Streatham Common; St. Peter's, Limehouse; All Souls', Harlesden; and a Baptist chapel at Hendon; and many London Board schools and police-stations, warehouses and banks, and other works from the plans of Sir John Taylor, Mr. Aston Webb, R.A., the late Mr. E. B. T'Anson, the late Mr. Ebenezer Gregg, Mr. R. Fabian Russell, and other architects. Mr. Nightingale served some years since as President of the Master Builders' Benevolent Institution; he had been a member of the London Master Builders' Association since its foundation, he was a prominent member of the Bricklayers' and Tilers' Guild, and of the National Liberal Club. The business of the deceased is being carried on by his sons, who have for years taken an active share in the management.

The Buile Hill estate at Pendleton, which was acquired by the Salford Corporation some time ago for the purpose of a park, was opened to the public on Wednesday.

Messrs. Wm. Potts and Sons, clock manufacturers, of Leeds, have just completed a new illuminated turret clock at the Victoria Mansions, Hull, for Sir W. A. Gelder and Mr. Kitchen, architects, Hull, and another at Messrs. Powolny's new restaurant, Hull, for Messrs. A. Neill and Son, architects, Leeds, and are erecting a new memorial clock at Elton Church, Hull, to the memory of the late Colonel Grimston, J.P., High Hall, Elton, W. Hull. Messrs. Potts are also erecting a large clock with four illuminated dials and bell at Potternewton, Leeds, and illuminated clock with two dials at Chapel Allerton, Leeds, and clock and bell for West Shrewsbury, Salop.

PROFESSIONAL AND TRADE SOCIETIES.

DEVONSHIRE CHURCHES AND SCREENS.—The annual meeting of the Devonshire Association was held at Sidmouth on Friday, when a paper on Devonshire church screens was read by Mr. F. Bligh Bond, F.R.I.B.A., Bristol. Mr. Bond dealt with the churches alphabetically, giving a short account of the screen work remaining in each church, and briefly describing the nature of the work and the character of the detail. There were 185 parishes in the county that still retained work of this class, some churches having more than one screen, the total number being between two and three hundred. The tide had set in somewhat strongly in favour of the restoration of these ancient marks or divisions, and Mr. Bond expressed his regret that in the restoration work the style known as "the new art" was being adopted, having regard more to immediate effect than truth to historical detail or harmony of surroundings. This departure he attributed to the effect of the teaching, without restraint, of the schools of art. He classified his screens according to their types, so far as he could do so, and detailed the treatment of the different screens.—Mr. E. Harbottle Reed, diocesan architect, of Exeter, described "A Doomed Exeter Church," that of Allhallows', Goldsmith-street. Under the Exeter Corporation Act, 1900, powers were granted for the removal of the church and for the appropriation of the site, or some part of it, for street improvement. Goldsmith-street, adjoining the church, was by its presence so contracted as to be at times dangerous to traffic, and which for greater convenience of access to the market it was desired to widen. The church was also stated to be unnecessary, owing to a great diminution in the number of residents in the parish. Mr. Reed traced the history of the church since 1584, and remarked that structurally the building was now in good repair. It had a modern front and small organ (in an ugly case); it was completely seated and complete in its fittings, receiving every care at the hands of the rector, who would no doubt keenly feel the proposed undoing of his fourteen years' labour in raising the funds absorbed by the renovation work. He recorded his thanks to Mr. Hope for the exceedingly courteous manner in which he had assisted in his investigations. In June of the present year a portion of Mr. Brooking's premises in Gandy-street, in the vicinity of the church, was pulled down to make way for new extensions, involving the demolition of an old wall about 3ft. in thickness. This revealed a quantity of ancient carved stones which had simply been utilised for walling purposes. Unfortunately, in effecting their removal, pickaxes damaged the foliage considerably, but sufficient was left to give some answer to the repeated question, "What has become of the Mediaeval buildings of Exeter?" By the courtesy of Messrs. J. Pinn and Sons, the architects for the extension works at Messrs. Brooking's, photographs had been taken of this curious medley of ancient stonework. Stones 1 and 2 are Norman scalloped capitals of tufa, and might possibly have been brought from St. Nicholas Priory, as they were about the date of that foundation, 1809. Nos. 3 and 4 are arch voussoirs very cleverly cut, of the Transitional period, and are of Salcombe stone. No. 5 is a Salcombe stone capital, Early English. It shows signs of old decoration. No. 6 is a nook shaft capital of Early English form, denuded of foliage; but the bell is richly coloured with vermillion and gilded. No. 7 is a Beestone nook shaft capital of Decorated date, and No. 8 is a portion of Late Perpendicular panelling. Upon the demolition of Allhallows Church the plate and registers would be deposited in St. Paul's Church.

NATIONAL BUILDERS' FEDERATION.—The half-yearly meetings of the National Federation of Building Trade Employers of Great Britain and Ireland began at Cardiff on Tuesday. About 150 delegates attended, and they were officially welcomed by the mayor at the South Wales Institute of Engineers, Park-place. Amongst those present was Mr. James Allen (president of the Cardiff branch of the federation). The mayor said that the crowded state of our cities was becoming a serious problem for solution by public authorities and public men. Having regard to the fact that so much was being said as to the value of good houses, particularly for the working classes, as a factor in the improvement of their social conditions, he considered that if it was part of the mission of the Building Federation to solve this question, they would set up a claim to

be in a sense pioneers of civilisation. Subsequently there was a meeting of the council. After lunch at the Royal Hotel (Mr. Allen presiding), the delegates proceeded to Cathays Park to inspect the new municipal buildings in course of construction. In the evening a banquet was held at the Royal Hotel.

NEWCASTLE ARCHITECTURAL AND ARCHEOLOGICAL SOCIETY.—The members will hold a third meeting of this year to-day (Friday) in Yorkshire. The members leaving Newcastle by the 9.30 train will pick up their colleagues en route and alight at Melmerby Station. They will drive to Wath and inspect the church containing the brasses of the Nortons of Norton Conyers (1420), the fine oaken chest, and other objects of interest. From thence they will visit Tanfield Church. The north aisle of this church (rebuilt in 1343) contains the monuments of the Marmions, the most important one being of alabaster with effigies of Sir Robert de Marnion and his wife. The gateway tower of Lord Marmion's Castle is quite near to the church; it has a fine oriel window, and the old bastion still is standing. They will drive next to Purneston Church, which was built about the year 1375. The spire surmounting the west tower of this church has shields containing arms on the four pinnacles. A visit to the quaint old almshouses (1680) in the village will be paid. From Burnstun the party will drive via Watling-street to the Late Decorated church at Kirklington, the south aisle of which was formerly a chapel of the Wandesfords. This is now inclosed by a screen of flowering tracery, and contains a brass dated 1463 and very fine effigies of John Wandesford and his wife, with one of Sir Christopher Wandesford. Kirklington Hall (1571), the property of the Wandesford family, will be visited next. The hall is famous for the secret passage which leads from it, and which can be followed for some thirty yards. The drive will be continued to Thirsk for dinner.

ROYAL ARCHEOLOGICAL INSTITUTE.—The annual meeting of this society was opened at York on Tuesday. The reception was given in the ancient Guildhall by the Lord Mayor, who referred to the fact that their last visit to York was so far back as 1846. The company adjourned to the Council Chamber, where Sir George J. Armitage delivered his presidential address. The afternoon was spent in an inspection of York Minster, St. William's College, and the treasurer's house. St. William's College was founded in 1453 as a college for the parsons and chantry priests of the cathedral to reside in. It stands at the east end of the Minster, and has lately been purchased by Convocation and the House of Laymen of the Northern Province, and it is intended to convert it into a church-house. The week's programme includes visits to various parts of the county and to a number of historical castles.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.—The preliminary midsummer examination, qualifying for registration as Probationer R.I.B.A., was held in London and various provincial centres on the 9th and 10th of June. One hundred and ninety-eight candidates were admitted, and claims for exemption from sitting for the examination were allowed to the number of 35. The remaining 163 candidates were examined, with the result that 117 passed, and 46 were relegated to their studies. The passed candidates, with those exempted—numbering altogether 152—have been registered as probationers. The intermediate examination, qualifying for registration as Student R.I.B.A., was held in London and four provincial centres on the 9th, 10th, 11th, and 12th June. One hundred and nineteen candidates were examined, of whom 50 only passed, the remaining 69 being relegated to their studies. Of the passed candidates, who all have been registered students, the three first given in order of merit as placed by the board of examiners are:—James Theodore Halliday, 1, Barlow-street, Oldham; James Reid, Beechwood-terrace, Palmarnock, Glasgow; and J. Hatton Markham, 23, Primrose Hill-road, N.W. The final and special examinations, qualifying for candidature as Associate R.I.B.A., were held in London from June 26 to July 3. Of the 55 candidates examined, 22 passed, and the remaining 33 were relegated to their studies. The successful candidates are as follows:—Edward Percy Archer, Etchingham Park-road, Church End, Finchley, N.; Ormrod Maxwell Ayrton [special examination], 28, Theobald's-road, W.C.; Henry Arthur Battley, Engineer's Office, L.B. & S.C. Railway, London Bridge, S.E.; Thomas James Bee, Heath View, Sidcup; Harry Thomas Bill,

6, Cherry-street, Birmingham; Herbert Black, Sussex House, Kensington Park-road, Notting Hill, W.; and William Alfred Thomas Carter, 66, Richmond-road, Bayswater, W. The number of failures in each subject of the final examination was as follows:—I. Design, 22; II. Mouldings and Ornament, 25; III. Building Materials, 13; IV. Principles of Hygiene, 14; V. Specifications, 11; VI. Construction, foundations, &c., 12; and VII. Construction, iron and steel, 13.

CHIPS.

Beckingham church tower, near Gainsborough, is about to be enriched by having a large chiming clock erected upon it. It will have two 6ft. dials, facing south and east. It will chime the quarters upon two bells, and strike the hours upon the largest bell. The work is being carried out, to the designs of Lord Grimthorpe, by Messrs. John Smith and Sons, Midland Clock Works, Derby.

At Buckingham Palace on Saturday the King formally conferred the honour of knighthood on Mr. William Alfred Gelder, F.R.I.B.A., the Mayor of Hull, and invested Mr. Henry Tanner, F.R.I.B.A., principal architect in H.M. Office of Works, and Mr. Robert Cochrane, F.R.I.B.A., of the Irish Board of Works, Dublin, with the Companionship of the Imperial Service Order.

At the Manchester Consistory-court, on Friday, the Chancellor granted faculties for the following alterations in churches:—Worsthorne, near Burnley, to remove the west gallery and two disused vestries; Stowell Memorial Church, Salford, improvement and completion of the pulpit and other alterations; St. Ann's, Clifton, to erect a plain oak reredos behind the communion table, and to enlarge the organ, and make alteration for an installation of incandescent lighting; St. Peter and Paul, Rishton, for the erection of a stained-glass memorial window in the north aisle; and St. Michael's, Croston, to substitute stained glass for the present plain glass in the three-light window on the south side of the chancel.

The Honorary Professorship of Forestry at the Royal Agricultural College, Cirencester, vacant by the death of Sir Henry Gilbert, F.R.S., has been filled by the appointment of Dr. W. Schlich, C.I.E., F.R.S., late Inspector-General of Forests, Government of India, and Principal Professor of Forestry, Cooper's-hill.

Princess Henry of Battenberg on Saturday afternoon laid the foundation-stone of the new chapel of the Royal Naval School, Eltham, henceforth to be known simply as Eltham College. The chapel, which replaces an iron building, will cost £3,000.

The statue of Queen Victoria, which will be unveiled by Princess Henry of Battenberg on Tuesday next, has now been erected in the gardens of the new Municipal Buildings at Scarborough.

The work in connection with the water supply which Lord Alverstone has provided for the village of Alverstone is practically completed. A reservoir, 80ft. by 60ft., with a capacity for 300,000 gallons, is being constructed on the top of Queenbow, and the source of supply is from the hills and near Apse Reach, where there is an abundance of water.

The gas committee of the Halifax Corporation have appointed Mr. J. Wilkinson, of the Grimes-thorpe Gas and Chemical Works of the Sheffield Gas Company, manager of the Halifax Corporation Gas-works, at a salary of £500 per annum, in succession to Mr. Thomas Holgate, resigned.

Mr. R. H. Bicknell, Local Government Board inspector, held an unopposed inquiry at Goole on Friday regarding an application by the urban council for sanction to borrow sums of £2,800 and £870 for the gas and water undertakings respectively.

The tramways at Reading, which have been converted from horse to electric traction for the corporation, were formally opened on Wednesday.

A bust of the late Sir William Henry Flower, F.R.S., Director of the Natural History Departments of the British Museum, the work of Mr. Brock, R.A., will be formally presented to the trustees of the British Museum by the "Flower Memorial Committee" to-morrow (Saturday). The Archbishop of Canterbury will receive and unveil the bust. The ceremony will take place in the central hall of the Natural History Museum at a quarter past one p.m.

The new trolley tunnel under the North River at New York City will have one of its twin tubes completed and ready for operation early next summer. This tunnel is the old Hudson River Tunnel, whose partly completed bores are being finished. According to the statements published, there remains only 1,200ft. more of the north tube to be completed, and work is progressing at the rate of from 3ft. to 13ft. per day. The south tube has not been commenced. This is to be 5,100ft. long.

Building Intelligence.

BIRMINGHAM.—The new crematorium for Birmingham, at Sheldon Coppice, near Rocky-lane, on the Birmingham and Walsall-road, at Perry Barr, is rapidly approaching completion, and in September will be opened by Sir Henry Thompson. Mr. Frank B. Osborn, of Birmingham, is the architect. The chapel and crematorium stand in the centre of the land, and are approached through an entrance gateway and drive from the main road, at which there is a lodge. At the entrance to the chapel there is a large vestibule. The size of the chapel itself is 50ft. by 25ft., and about 40ft. high to the ridge, with an open-timbered roof, the total length of the building being about 107ft. On one side there is a vestry and registry office with a separate entrance, and on the other side a small mortuary chamber. The chapel is principally lighted by lofty clerestory windows, and underneath these on both sides are recesses for the reception of urns containing the ashes of the dead. If relatives prefer, these urns may be placed in cloisters of ornamental design, which they will be at liberty to erect in the grounds. The chapel, which is of an ecclesiastical character, in brick and red stone, with tiled roof, will be provided with chairs and furnished with a reading-desk and harmonium. The draped catafalque will be against the end wall opposite the entrance, and is to stand on a stone platform approached by two steps. Immediately behind the catafalque, and concealed by curtains, is an iron door leading to an intermediary chamber. On the north-west side is a tower, 80ft. in height, containing the stack. The coffin, when brought into the chapel, is placed upon a catafalque. When the committal sentence in the religious service is reached, the coffin passes noiselessly, by means of an invisible mechanical arrangement, into the intermediate chamber, and finally into the incinerating chamber, but not till the mourners have left the chapel. The incinerating chamber is filled with gas in a state of incandescence. The temperature attained is about 2,000° Fahr.

DERBY.—The foundation stone of a new church, which is being built on the site of a former church, dedicated to the Holy Trinity in the London-road, Derby, was laid on Wednesday afternoon July 15, by Mr. C. E. Newton, J.P.D.L., of Mickleover Manor. The total cost of the new church is £9,400. Messrs. Walker and Slater, of Derby, are the builders. The architect is Mr. C. E. Hewitt, of 118, Queen's-road, Brighton.

GREAT YARMOUTH.—The new municipal pier and pavilion erected by the corporation on the south parade on the site of the old Wellington pier was opened last week. It is 600ft. long, and 40ft. wide at its sea and shore extremities, but broadened out in its centre, where it is 136ft. square. It has been built on iron screw columns and piles of Jarrah wood. The columns are connected and braced with iron girders, upon which the deck of the pier, also of red Jarrah wood, has been laid. The sides have been filled in with metallic shields, bearing the Yarmouth and East Anglian arms alternately, this form of decorative ironwork being introduced as an ornamental variant on tubular railings. At the pierhead a fishing platform is to be constructed later. Seating accommodation has been provided along the sides in the usual form of continuous benching. The pavilion is a structure of original design, flanked by two dome-topped towers, 60ft. in height, the style being that of "L'art nouveau." Its design was modelled by the borough surveyor, on the type of buildings so much in vogue for Continental exhibitions. The pavilion has cost about £3,000. It is 119ft. in length, with a breadth of 90ft., and a height to the centre of the roof of 34ft. It has been built of wood, over a skeleton steel frame, and covered with Uralite. This Uralite has been extensively used both outside and inside the building, and also beneath the floor. The auditorium is clear of all pillars, and the only columns are those at the sides, from which spring the arched girders supporting the curved roof. Around the walls from the floor are panels of Lincrusta Walton, stencilled in a variety of artistic designs, and above these run a series of smaller panels, with moulded figures. The ceiling is white, relieved with squares in red Jarrah framing. As a clerestory a series of stained-glass panels have been introduced, representing the various stages through which the world's

shipping has passed. There are illustrated Julius Caesar crossing from Calais to the invasion of England, a Viking fleet, Cleopatra travelling up the Nile, William the Conqueror's ships, Illegist and Horsa's vessels, the *Great Harry*, one of the first British battleships, the Spanish Armada, and Nelson's ships. Across the west front is a stained-glass window showing a fleet of East Indian clipper merchantmen sailing away from the setting sun. The central floor space, covered with cork lino, is occupied with tip-up armchairs, upholstered in pegamoid, and tip-up padded benches. The space at the back and at the sides, with the raised gallery at the back, are all to be devoted to promenading. Accommodation will be found within the pavilion for 2,100 persons. Each of the columns at the sides admits a current of fresh air that circulates through the building, while in the ceiling are two openings that give the effect of a sliding roof. Lighting is supplied at night by 120 electric lamps, that stud the ribs of the roof and run down the walls. Outside the pavilion there is an installation of electric lights, each of which has a reflector at the back and a glass screen in the front. The windows just below the copper domes of the towers are to be filled with purple glass, behind which electric lamps are fixed. The buttresses on each side are surmounted by an ornamental steel finial, at the top of which an electric globe light has been placed. A stage has been provided, 32ft. wide and 26ft. in depth, which is fronted by a sunk orchestra of eight performers.

LONDON COUNTY COUNCIL.—At Tuesday's meeting of the Council, a report was submitted by the Highways Committee recommending that the Council should seek power next session to construct new tramways of a total length of 29½ miles, and the doubling and reconstruction of existing tramways of a total length of 3½ miles at a total estimated cost of about £1,580,325. The street widenings necessitated thereby were dealt with by the Improvements Committee, and the total estimated amount chargeable to the tramways account in respect of these widenings was about £228,267. Amongst the tramways proposed are lines from Hampstead-road, along Tottenham-court-road, to Oxford-street; from the Westminster Bridge-road, via Victoria Embankment, to the north side of the Strand; from the Marble Arch to Cricklewood, and through the Blackwall Tunnel. The report was adopted. The Improvements Committee submitted their report on the proposals for improvements, for which it was suggested that application should be made to Parliament next session. The committee stated that the total net cost to the Council of the suggested county improvements was estimated at £456,534, after deducting the contributions from the local authorities. If the Council adopted the report in its entirety, the net amount voted for street improvements during the fifteen years commencing March, 1889, and ending in March, 1904, would be about £7,879,948, which represented an average annual vote of about £525,060. This report was agreed to. Upon the recommendation of the Technical Education Board, it was agreed to appropriate, at a cost of £30,000, a site in Southampton-row for the proposed London Day Training College. This site is next to that already allocated for the Central School of Arts and Crafts.

NORWICH.—The Grand Opera House, now in course of completion in St. Giles's and Goat-lane, will be opened on Monday, August 3, in the presence of the Mayor of Norwich (Lieut.-Colonel Harvey). It is a curious coincidence that a Colonel Harvey, who was then High Sheriff, opened the old Theatre Royal in Theatre-street, built from designs by William Wilkins, on March 27, 1826. Mr. W. S. R. Sprague, of Arundel-street, Strand, W.C., is the architect, and Messrs. Langden and Sons, Limited, of Sheffield, are the contractors for the new Opera House, which has a stone and cement elevation of Italian character facing St. Giles's-street. The entrance steps of the vestibule stand back 40ft. from the road. The vestibule, 27ft. by 8ft. 6in., leads into the grand crushroom, which is 30ft. by 20ft. There are four private boxes and numerous stalls. Over the pit is the dress-circle, above that the balcony, and then the gallery. Each tier is cut off from the one beneath it by a fireproof floor of cement and concrete, and the stage is separated from the theatre by a fire-resisting curtain of steel and asbestos. The stage is 70ft. by 40ft., and 50ft. high to the "grid." At the Goat-lane end, in a block quite

separate from the theatre, are the dressing-rooms, twelve in number. Under the theatre itself, in addition to the stage-cellar, are rooms for electrician, transformer's-room, gas man's room, band-room, property-rooms, &c. From the grand saloon at the front of the house a promenade opens over the St. Giles's frontage, forming a balcony 14ft. in width. The theatre is lit by electricity, and the paving in the vestibule, grand crushroom, and lavatories is to be of terrazzo, and elsewhere it will be granolithic.

SPARKBROOK, BIRMINGHAM.—Field-Marshal Earl Roberts laid, when at Birmingham on Saturday, the memorial-stone of the new headquarters of the 1st Warwickshire Royal Garrison Artillery Volunteers, in Stoney-lane, Sparkbrook. These buildings, which are to cost when completed between £8,000 and £10,000, will abut both on Stoney-lane and Dennis-road, and will cover an area of about two acres. The main hall will have a frontage to Stoney-lane, and will be built of brick, with stone dressings, in the Tudor style, from the plans of Captain Daniel, honorary architect. On the same afternoon Lord Roberts unveiled, in Chamberlain-square, Birmingham, the memorial of the Royal Warwickshire Regiment to their comrades who fell in the Soudan campaign.

WEDNESFIELD.—Some eighteen months ago the parish church of St. Thomas, Wednesfield, was destroyed by fire, and immediately afterwards a committee was appointed to carry out the work of rebuilding. Drawings were prepared by Mr. Fred T. Beck, architect and diocesan surveyor, of Wolverhampton, and the contract was placed in the hands of Messrs. H. Willecock, of Wolverhampton. The whole of the church has been rebuilt, except the main walls of the nave and the tower at the west end, which have been repaired and pointed, and new balustraded parapets have been erected. The opportunity has also been taken for the enlargement of the church by the addition of a chancel to accommodate the choir and clergy, seats for whom were formerly in the nave. The organ-chamber has also been enlarged, vestries for the choir and clergy have been provided, and a semicircular apse, forming the sanctuary, has also been added at the east end. The total cost has been about £5,000.

The completion is announced of the scheme for the extension of the Edinburgh Royal Infirmary. The expenditure on it has amounted in round figures to £136,000, including the cost of the site. This has all been met, save about £6,000, out of donations and bequests.

A mantelpiece and overmantel, all of statuary marble and Portland stone, have just been carried out and erected, at uncommonly short notice, in the hall of the Admiralty House, Mount Wise, Devonport. Everything has been commenced and finished within a very few weeks, in anticipation of a possible visit there by the Prince and Princess of Wales. The design was prepared by Mr. W. J. Clarke, the chief superintending civil engineer at Devonport Dockyard, and has been carried out in its entirety, under his immediate superintendence, by Messrs. Harry Hems and Sons, sculptors, of Exeter. This addition is 11ft. high. All the names of the various Commanders of the Plymouth station beginning with Vice-Admiral John Amherst, 1774, and ending with Sir E. H. Seymour, G.C.B., O.N., 1903.

Princess Henry of Battenberg laid on Wednesday the foundation-stone of the new permanent Emmanuel Church at Northwood, Middlesex. Nearly fifty years ago the foundation-stone of the parish church was laid. The population then numbered about 400 persons; it is now about 3,000, and has practically doubled within the last seven years. When completed the church will provide accommodation for 750 persons, at a cost of £7,500. The portion of the church at present to be built will seat 500, at an estimated cost of £5,000, towards which £3,500 is in hand.

Viscount Ridley at Blyth on Tweed unveiled a memorial in the form of a granite Northumbrian cross to the memory of the soldiers from that part of Northumberland who fell in South Africa.

The Dean of Rochester has received a cheque for £5,000 from Mr. T. H. Foorl, of Acorn House, Rochester, and the Granga, Botley, Hants, for the purpose of completing another section of the work of restoring Rochester Cathedral. The only condition imposed by the donor is that local builders shall, as far as possible, be employed in the work on the fabric. The Dean and Chapter will take the matter in hand immediately, and they also intend to make an effort to raise £1,500 for the repair of the organ.

COMPETITIONS.

COLWYN BAY.—In the competition for designs for a block of business premises proposed to be erected at the corner of the Penrhyn and Conway roads, Colwyn Bay, the first premium has been awarded to Mr. E. A. Lloyd, of Blackburn, Lancashire, and the second to Mr. D. M. Roberts, of Colwyn Bay.

CHIPS.

On Sunday, the mother church of Stonehouse, Devon, St. George's, was reopened after undergoing extensive renovation lasting upwards of two months.

The King of Spain has accepted the position of patron and honorary president of the International Congress of Architects, which is to be held in Madrid.

At a meeting of the Shipley Urban District Council on Tuesday night, plans were approved of new public offices, baths, and workshops, which are to be erected on the Manor House estate, at an estimated cost (exclusive of the site) of £24,000.

The finance committee of the Liverpool Corporation have received a report from Mr. T. Stirling Lee relative to the completion of sculpture at St. George's Hall. They have decided to recommend the city council to engage Mr. Stirling Lee to execute twelve figures above the panels on the east front of the hall, being part of the scheme of sculpture for the completion of the building.

The new police-station and public free library at the corner of Dewsbury-road and Hunstet Hall-road, Leeds, are to be formally opened by the Lord Mayor of Leeds this (Friday) afternoon.

The Bill confirming the order of the Local Government Board for the compulsory incorporation of the borough of Bootle with the city of Liverpool was rejected on Tuesday by a committee of the House of Commons.

A disastrous fire occurred at Todmorden on Saturday, the extensive woodyard and shop of Mr. Marmaduke Mallinson, builder, of Stansfield-road, Todmorden, being gutted. The damage is computed at about £3,000.

Mr. George Plowman, prominent in Philadelphia as the designer and builder of theatres, died in that city, July 7, of paralysis after a brief illness. He was the architect for the old Central Theatre, for the People's Theatre, and for the Grand Opera House.

Because inferior mortar was used in the construction of two big buildings at the United States Government Powder Works, Picatinny, they are to be torn down and others erected. The buildings are of brick, and were built at an expense of £3,000 sterling, a New York firm having the work. When the inspector from Washington went through the works lately he discovered that mortar had been used which was not up to the grade specified in the contract, and he immediately ordered the destruction of the buildings.

The official inspection on behalf of the Board of Trade of the route and line of the new tramway system connecting Blantyre, Hamilton, Motherwell, and Wishaw was made on Tuesday by Colonel Yorke. Colonel Yorke was accompanied by Mr. Trotter. The distance between Blantyre and Wishaw is 8½ miles.

The Royal Architectural Museum, Tufton-street, Westminster, which was recently presented by the Museum Council to the Architectural Association, as will be remembered by our readers, will be reopened to the public about April next, by which time the necessary alterations will be completed.

At Minchinghampton Church on Sunday, two memorials were dedicated. One is a stained-glass window, from the studio of Mr. H. W. Bryans, in memory of the late Mr. H. D. and Mrs. Ricardo, of Gatecombe Park, the subject being the Adoration of the Shepherds and Angels at the cradle of the infant Saviour. The other is a bronze tablet, in memory of the two men from this Cotswold hill parish who fell in the late war.

The late Miss Martha Leggatt, of Bramford House, near Ipswich, has bequeathed to the Ipswich Corporation for the Christchurch Mansion, in that borough, a painting of the Virgin, the Infant Jesus, and St. John, by Andrea del Sarto, and three other pictures.

The Hon. E. Lyulph Stanley, vice-chairman of the London School Board, on Monday opened three new Board schools in Plumstead. One in Bostall-lane is to accommodate 1,000 children, one in Wickham-lane 600, and one in Church Manor-way 900.

The additions to the borough sanatorium, Sunderland, are being warmed and ventilated by means of Shorland's patent Manchester stoves with descending smoke flues, those previously supplied having proved satisfactory.

Engineering Notes.

THE INVERGARRY AND FORT AUGUSTUS RAILWAY.—This new line was formally opened for traffic on Wednesday. It is worked by the Highland Railway Co. The necessity for a rapid means of transit through the Great Glen of Scotland is great. The canal steamers take over eight hours to do the journey of 60 miles between Banavie and Inverness. By means of the new railway the journey will be shortened by at least an hour, but ultimately the Highland capital must be connected direct with the west by rail. The Highland Railway Co. contemplate applying to Parliament for powers to construct a light railway to the northern end of Loch Ness, and, if they be successful in that, another hour would be cut off the Strathmore journey, and passengers would be landed at the Highland Station in Inverness, instead of having to disembark, as at present, at Muirton Locks. Leaving Spean Bridge contiguous to the West Highland Railway Co.'s station there, the Invergarry and Fort Augustus line follows the course of the Spean for several miles. This river is crossed about a mile from the start on a girder bridge erected at a height of over 70ft. above the river. At High Bridge—one of General Wade's structures—the railway passes close to the spot where the first shot in connection with the Jacobite rebellion of '45 was fired. To Gairloch, a run of about three miles, the country is barren, but a backward view reveals the snow-clad Ben Nevis towering above adjacent heights, while in the western distance the hills of Ardgour and waters of Linnhe Loch have their own special charm. After leaving Gairloch the railway takes a sharp curve in a north-easterly direction, and traverses some wooded glades in the estate of Glenfintaig. A viaduct carries the line over the River Gloy, at a height of 60ft. above the bed of the river, the central girder of the viaduct having a span of 100ft. From Invergloyle the line rises to an elevation of 350ft. above the loch level, and clings in side cutting to the hillside. The summit of the line is reached about eight miles from the commencement, and at Laggan there is a gradual fall to the canal level. Loch Oich now comes within view, and following the eastern shore of this stretch of water the line has been formed on short embankment and through light rock cutting. A tunnel of about 67yds. in length occurs on this stretch, and after emerging therefrom, the Culder burn is crossed on a skew viaduct of five spans. Flouting had to be resorted to in order to carry the track through a moss cutting a little to the north, and when passing a shallow arm of Loch Unigan the slope has been pitched with boulders to prevent scouring. A run of three miles down a valley, separated from the river and the canal by a low range of hills, brings the termination of the line within sight. Immediately to the east of Fort Augustus the line is carried across the canal by means of a swing bridge of 54ft. clear span, and in order to land passengers at the Loch Ness pier, the railway has been carried across the river Oich on a viaduct consisting of four spans, two of 100ft. and two of 50ft. Twenty-four miles in length, the construction of the line was carried out by Messrs. James Young, Ltd., Glasgow, and the estimated cost of the undertaking was £250,000. The engineers were Messrs. Formans and MacCall, Glasgow.

The church of St. Paul, Stafford, was reopened on Sunday after redecoration. The work of decorating the church was intrusted to Messrs. Brookfield and Wilmshaws, of Stafford.

The library, museum, and arts committee of the Liverpool Corporation are publicly exhibiting this week the large mural decoration recently executed for the Toxteth Branch Library by two young Liverpool painters, Messrs. W. Alison Martin and Clinton Balmer; also a panel in repoussé copper and enamel, designed and executed by Mr. C. E. Thompson in commemoration of the opening of the library by Mr. A. Carnegie.

Mr. Lyulph Stanley (vice-chairman of the School Board for London) has opened a new building in the Aristotle-road, Bedford-road, Capriam. It is called the Haselrigge-road Senior Girls' School, and is to be a higher-grade school. There is accommodation for 450 pupils. This is the first school under the Board erected entirely for senior girls, and the old Haselrigge-road School will now be left entirely to the boys. Messrs. Garrett and Son, of Clapham and Balham, were the contractors for the new school.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the BUILDING NEWS, Clement's House, Clement's Inn Passage, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to THE STRANO NEWSPAPER COMPANY, LIMITED.

Telegraphic Address:—"Timeserver, London."
Telephone No. 1633 Holborn.

NOTICE.

Bound copies of Vol. LXXXIII. are now ready, and should be ordered early (price 12s. each, by post 12s. 10d.), as only a limited number are done up. A few bound volumes of Vols. XXXIX., XL., XLVI., XLIX., LII., LXI., LXII., LXIV., LXV., LXVI., LXVII., LXVIII., LXIX., LXXI., LXXII., LXXIII., LXXIV., LXXV., LXXVI., LXXVII., LXXIX., LXXX., LXXXI., and LXXXII. may still be obtained at the same price; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

Handsome Cloth Cases for Binding the BUILDING NEWS, price 2s., post free 2s. 4d., can be obtained from any Newsagent, or from the Publisher, Clement's House, Clement's Inn Passage, Strand, London, W.C.

TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 0d. (or 6dols. 30c. gold). To France or Belgium, £1 6s. 0d. (or 33fr. 30c.). To India, £1 6s. 0d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 0d.

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of eight words, the first line counting as two, the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Situations and Partnerships.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" and "Partnerships" is ONE SHILLING FOR TWENTY-FOUR WORDS, and Sixpence for every eight words after. All Situation Advertisements must be prepaid.

* * * Replies to advertisements can be received at the office, Clement's House, Clement's Inn-passage, Strand, W.C., free of charge. If to be forwarded under cover to advertiser an extra charge of Sixpence is made. (See Notice at head of "Situations.")

Rates for Trade Advertisements on front page, and special and other positions, can be obtained on application to the Publisher.

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page Advertisements and alterations in serial advertisements must reach the office by Tuesday morning to secure insertion.

RECEIVED.—R. J. B.—H. K. (Newcastle).—T. R. M.—C. M. S.—P. L. and Co.—A. W. T.—C. B.

Correspondence.

THE BUILDING TRADE IN SOUTH AFRICA.

To the Editor of the BUILDING NEWS.

SIR,—While several communications have appeared in home papers pointing out the shortage of workmen which the building trade in Cape Town, Durban, and Johannesburg has been experiencing, and the advantages to be found by men emigrating to these towns, so far no notice has been taken of the needs of Port Elizabeth, and it is in the hopes that the "Cry from Macedonia" may have the effect of turning the attention of good tradesmen to this port that you are asked to be good enough to insert it in your journal.

In common with the rest of South Africa, the building trade in Port Elizabeth is extremely brisk, despite the great and increasing advance in the cost of labour and the difficulty in obtaining good tradesmen. All the builders in the town have had their hands full of work, so much so in fact that architects have the greatest difficulty

in obtaining tenders for contemplated buildings. For jobs of any size or importance an average number of tenders is about three or four, whilst the time required by the tenderers for completion of works is fully one-third more than was formerly the case, and the price nearly double.

A number of large buildings are now in course of erection or of completion in the town, including among others the new premises for the Bank of Africa, a terracotta building for which Mr. W. H. Stucke, of Johannesburg, is architect, a seven-story building in Main-street for Messrs. Cathbert, for which Messrs. Hubert, Walker, and Tomlinson are architects, a large block of residential chambers and shops facing Donkin Reserve, a three-story island block of warehouses for the Harbour Board Commissioners, and the new administrative offices for the same body (Messrs. Victor T. Jones and W. J. McWilliams being the architects for the three latter), as well as numerous other warehouses and buildings of a less important character, while the erection of several "skyscrapers" is also in contemplation.

The projected scheme of the Harbour Board for a new harbour and wharves on a huge scale at the mouth of the Zwartkops River will undoubtedly cause a demand for new warehouses, &c., in that quarter of the town; and, in general, the prospects of the trade in Port Elizabeth are extremely good if labour can only be procured in sufficient quantities to enable work to go on in a more rapid and economical manner.

The increase in the wages of workmen owing to their scarcity is, of course, the principal factor in the present high prices of building work. Whereas in June last year carpenters were asking 1s. 5d. and bricklayers 1s. 4d. per hour, in the same month this year carpenters are obtaining 2s. 3d., and bricklayers 2s. and 2s. 1d., and many are but only half-competent men at that. Bricklaying is largely in the hands of the Malays, although lately a few London and Australian bricklayers have been specially brought out by the contractors for two of the largest jobs.

The permanent barracks and camps being built up country for the military authorities have drained the coast towns of men, as much as 2s. 6d. an hour being paid to carpenters by the contractors for these works; and, in fact, in tendering for work in Port Elizabeth, builders are already allowing for a probable increase in prices to that extent.

That this town is worse off for workmen than either Cape Town or Durban is due to the fact that no line of steamers sails direct to this port, while men coming to the country leave the boat usually at the first port of arrival, generally with the idea of proceeding to the Rand.

Workmen who contemplate emigrating to South Africa could not do better, therefore, than to make for Port Elizabeth, any decent tradesman being certain of employment at good wages, while the cost of living, compared with that of other South African towns, is fairly moderate. Contractors with a little capital would also probably do well in the town, as the present contractors are almost overburdened with work.—I am, &c.,

Port Elizabeth, June 26. M. S. A.

Mr. W. B. Purser, of Horsham, who has held the appointment of surveyor and bridgmaster to the West Sussex County Council since 1896, has been elected road engineer to the Kesteven County Council.

In the House of Lords on Monday, the City and South London Railway Bill, providing for an extension from the Angel, Islington, to King's Cross, St. Pancras, and Euston, and transferring to this company the powers of the City and Brixton Railway Scheme, was read a third time and passed. The Romford and District Tramways Bill was also on the same evening read a third time and passed. Both measures have already been through all stages in the House of Commons, and only await the Royal Assent.

Mr. John Tweed, sculptor, has just completed the statue of the late Colonel Benson, R.A., which is intended to be erected near the old abbey at Hexham. It represents an officer who has checked his stride for the purpose of conveying some instructions to an "orderly." The face is turned slightly to the right, while a field-glass is held ready for any observation that the field may require. The figure stands 9 ft. high, and will stand on a 12 ft. pedestal of granite.

A House of Lords Committee passed, on Friday, the unopposed Bill promoted by the London United Tramways Company, empowering the company to carry out certain road widenings and improvements in Barnes, Richmond, Twickenham, and Teddington at a cost of about £100,000.

MEMORIAL TO THE LATE E. ONSLOW FORD, R.A., ST. JOHN'S WOOD.

The memorial to the late Edward Onslow Ford, R.A., has now been erected in St. John's Wood, within a few minutes' walk of the late sculptor's studio. It is in the form of an obelisk; on one side it is adorned with a replica of the Muse at the base of the Shelley memorial at Oxford—one of Onslow Ford's works with which he himself was best pleased—and on the other by a medallion portrait of the sculptor. The whole is suitably protected with railings and lamp-posts. The selection of Mr. John W. Simpson to prepare the design of the memorial was a much-valued recognition, as coming from brother artists of high standing. The problem was a somewhat difficult one, as the slight and graceful figure of the Muse from the Shelley memorial had to receive a setting which, while in suitable scale with the delicate subject, should, at the same time, form a sufficient mass to hold its own at the wide junction of Grove Road and Abbey-roads. Mr. A. C. Lucchesi undertook the modelling of the portrait medallion on the north side. The masonry is of selected white-bed Portland stone, from the quarries of the Bath Stone Firms, Limited, and was executed by Mr. Tomes with great personal care and attention. The casting of the bronze lamps and the collar of the obelisk with voluted angles was intrusted to Mr. Omar R. Albrow. The principal figure was cast by Mr. A. Parlanti. The monument is so placed as to leave the full carriageway of the three roads surrounding it clear and unimpeded.

PARKWOOD, HENLEY-ON-THAMES.

This picturesque riverside house, from the designs of Mr. William Flockhart, the architect, is finished with stucco for the external walling, and inside the building is elaborately fitted with panelling, &c., in hard woods. A great feature is made of the big hall. We shall, at an early date, give an interior from the architect's Academy drawing, when we may give a plan and other particulars.

A ROW OF NEW HOUSES, HORNTON STREET, KENSINGTON.

The rebuilding of Horton-street is being carried out by Messrs. W. A. Daw and Son, of Palace Gate, from the designs of Mr. Frank S. Chesterton, architect of Cheapside, E.C. The fronts are in red brick and a white French stone (Palotte). The roofs are covered with hand-made red tiles. The height of the buildings was restricted, and only a limited number of gables allowed. The frontage of each house is 21ft., the number of houses eighteen. The depth of the site is such that no break in the main frontage

line was permissible. Horton-street rises about 2ft. 6in. in every 100ft. The plan, with the exception of a large hall, is the usual one for a town house with three reception-rooms and nine bedrooms. A portion of the design is shown in the Royal Academy Exhibition.

BRIGHTON AQUARIUM RECONSTRUCTION.

In August, 1901, the Brighton Corporation obtained powers under a Parliamentary Bill to purchase the Brighton Aquarium buildings, freehold, for £30,000, and for the expenditure of some £60,000 upon a scheme of reconstruction in accordance with a plan prepared by Mr. A. Hessel Tiltman, F.R.I.B.A., of 51, Russell-square, London, who had been previously, in 1900, appointed by the corporation their consulting architect in this matter, for which a competition for designs was proposed at that time. It may be remembered that some thirty years ago there was a popular movement all over the country in favour of the establishment of public aquaria for the convenient study of anatomical and physiological problems in marine botany and zoology, and the present Brighton Aquarium and many others of a similar character were the immediate outcome. A large proportion of these buildings, notably those at Westminster, Southport, Scarborough, and others of less importance, failed, and are no longer in existence. Brighton Aquarium, one of the first of the original establishments, and probably the best arranged and most complete of all, is now almost the only considerable institution of its kind remaining. Erected in 1872 at a total cost, roughly speaking, of £120,000, the buildings occupy a site abutting upon the Madeira-road of 715ft. long, with a width varying from 42ft. to 102ft. It contains about 40 tanks, ranging from 10ft. to over 100ft. in length. No. 6 tank, designed for porpoises, congers, turtles, and other animals of larger size, has an area of 4,620ft. super., a frontage of 126ft., and a water capacity of 113,000 gallons. The corporation, on obtaining possession of the buildings, were faced by a problem of very considerable difficulty, to the anxious consideration of which the Aquarium Committee, representing the best business instincts of the town, have been directed for the last three years—unfortunately, so far, with no settled conclusions as to the best policy to adopt in their utilisation. Whilst it is desired by some to retain the educational value of the "Marine Zoological Garden," as it was called at first, it has to be recognised that the maintenance and supply of the inhabitants of the tanks, &c., together with the care of a building covering some 35,000ft., involves a very large sum annually. Unfortunately, aquaria as an element of entertainment have lost of late years much of their novelty and attraction. Moreover, the present condition of the premises renders imperative structural and decorative repair, with fresh engineering plant, &c., even to properly rehabilitate the buildings for their present purpose. All this contributes to render the task of the committee a very formidable one. They naturally desire, even in adding this institution to the other excellent series of educational and recreative establishments of the municipality, to render it self-supporting—an object, however, it should be remembered, that has been attained in no other instance. In furtherance of their study of this problem, the committee, at an early stage of its consideration, visited, in company with Mr. Hessel Tiltman and Mr. F. J. C. May (the borough engineer) many of the existing institutions of a similar and allied character, with the result that it was finally resolved to combine with the Aquarium, reconstructed and enlarged, the additional attraction of a Winter Garden, and converting at the same time the flat roofs into a free and open space laid out suitably as gardens, &c. Two separate schemes based upon this idea recommended by the committee, on being submitted to the Borough Council, were finally rejected, and the subject of our illustration in to-day's issue forms the last of some four or five schemes which, to the instructions of the committee, have been prepared and reported upon by Mr. Hessel Tiltman. In principle this scheme retains the present Aquarium establishment, but relies upon artificial means only for its lighting, as at Blackpool and some of the Continental establishments, utilising the very large expanse of flat roofs for a large new Winter Garden. The chief feature of this latter is a long arcaded avenue 22ft. wide and 500ft. in length (with a possible extension in the future of a further 300ft.). Along the northern boundary of

this avenue is shown a range of some 50 lock-up shops; whilst the side opposite and seaward is occupied by a large music annexe, café restaurant, tea-house, palm-house, aviaries (both internal and external), arbours, and ferneries, together with ladies' and gentlemen's retiring rooms. Outside are an outdoor bandstand and space for seats round same; restaurant, piazzas, tea gardens, the remainder of the area being laid out for a terrace promenade with fountains, ornamental flower-beds, fishponds, &c. The extended length (on land belonging to the corporation and connecting up with the shelter in the Madeira-road) might have been used probably as a botanical adjunct. In this design Mr. Hessel Tiltman has adopted a modified form of Indian (Jeypore province) style, as best enabling him to connect up the form of his work with that of the existing building. It was proposed to construct the new buildings with coloured glazed bricks, faience ware, plaster, with ornamentally glazed and copper-covered roof. The estimated cost of the work comprised in this scheme was between £38,000 and £40,000.

LIVERPOOL CATHEDRAL.

We illustrated the main side elevations of Mr. Malcolm Stark's design for this big church in the BUILDING NEWS for June 5, at the time his plan appeared. On June 19 the main entrance front was published in detail, and on July 10 an elevation of the choir end, with the tower and spire, was reproduced. To-day we print photographs of Mr. Stark's east elevation for the cathedral, and the longitudinal section, accompanied by a plan of the groining over the great octagon, which is not emphasised on the exterior of the building save by a flèche which rises over the crossing. It is interesting to compare this treatment with those which form such distinguishing features in the designs submitted by Messrs. Austin and Paley, and by Mr. Nicholson, as already illustrated in our pages.

DESIGN FOR A SMALL LIBRARY.

A proposed library for a country town, to cost £1,500, designed by Mr. James A. Swan, architect, of Birmingham. On ground floor accommodation is provided for 12,500 volumes in lending department, and 86 readers in reading-room and ladies' room. The first floor contains a reference library and patent library. The materials are walling of red bricks, stone dressings, and Stow-in-Wold slates.

SALE ROOM AND OTHER SKETCHES.

This curious old oak Elizabethan Escoignure, dated 1603, which originally came from an old farmhouse near Driffield, Yorkshire, was recently sold at Messrs. Phillips, Son, and Neale's Rooms. The panel door is carved with cross swords, battle-axes, crosses, keys, &c., and on the top of the panel is the inscription, "William Shakespeare, 1603." Notwithstanding its great age (300 years), this little piece of furniture is in an excellent state of preservation. The Chair is of later date, also of oak, with scroll arms, leather seat, and back studded with bronze nails; the legs are plain, tied together with a broad carved rail in front. The second Cabinet or Credence is of Gothic design, and probably of German workmanship of the 15th century.

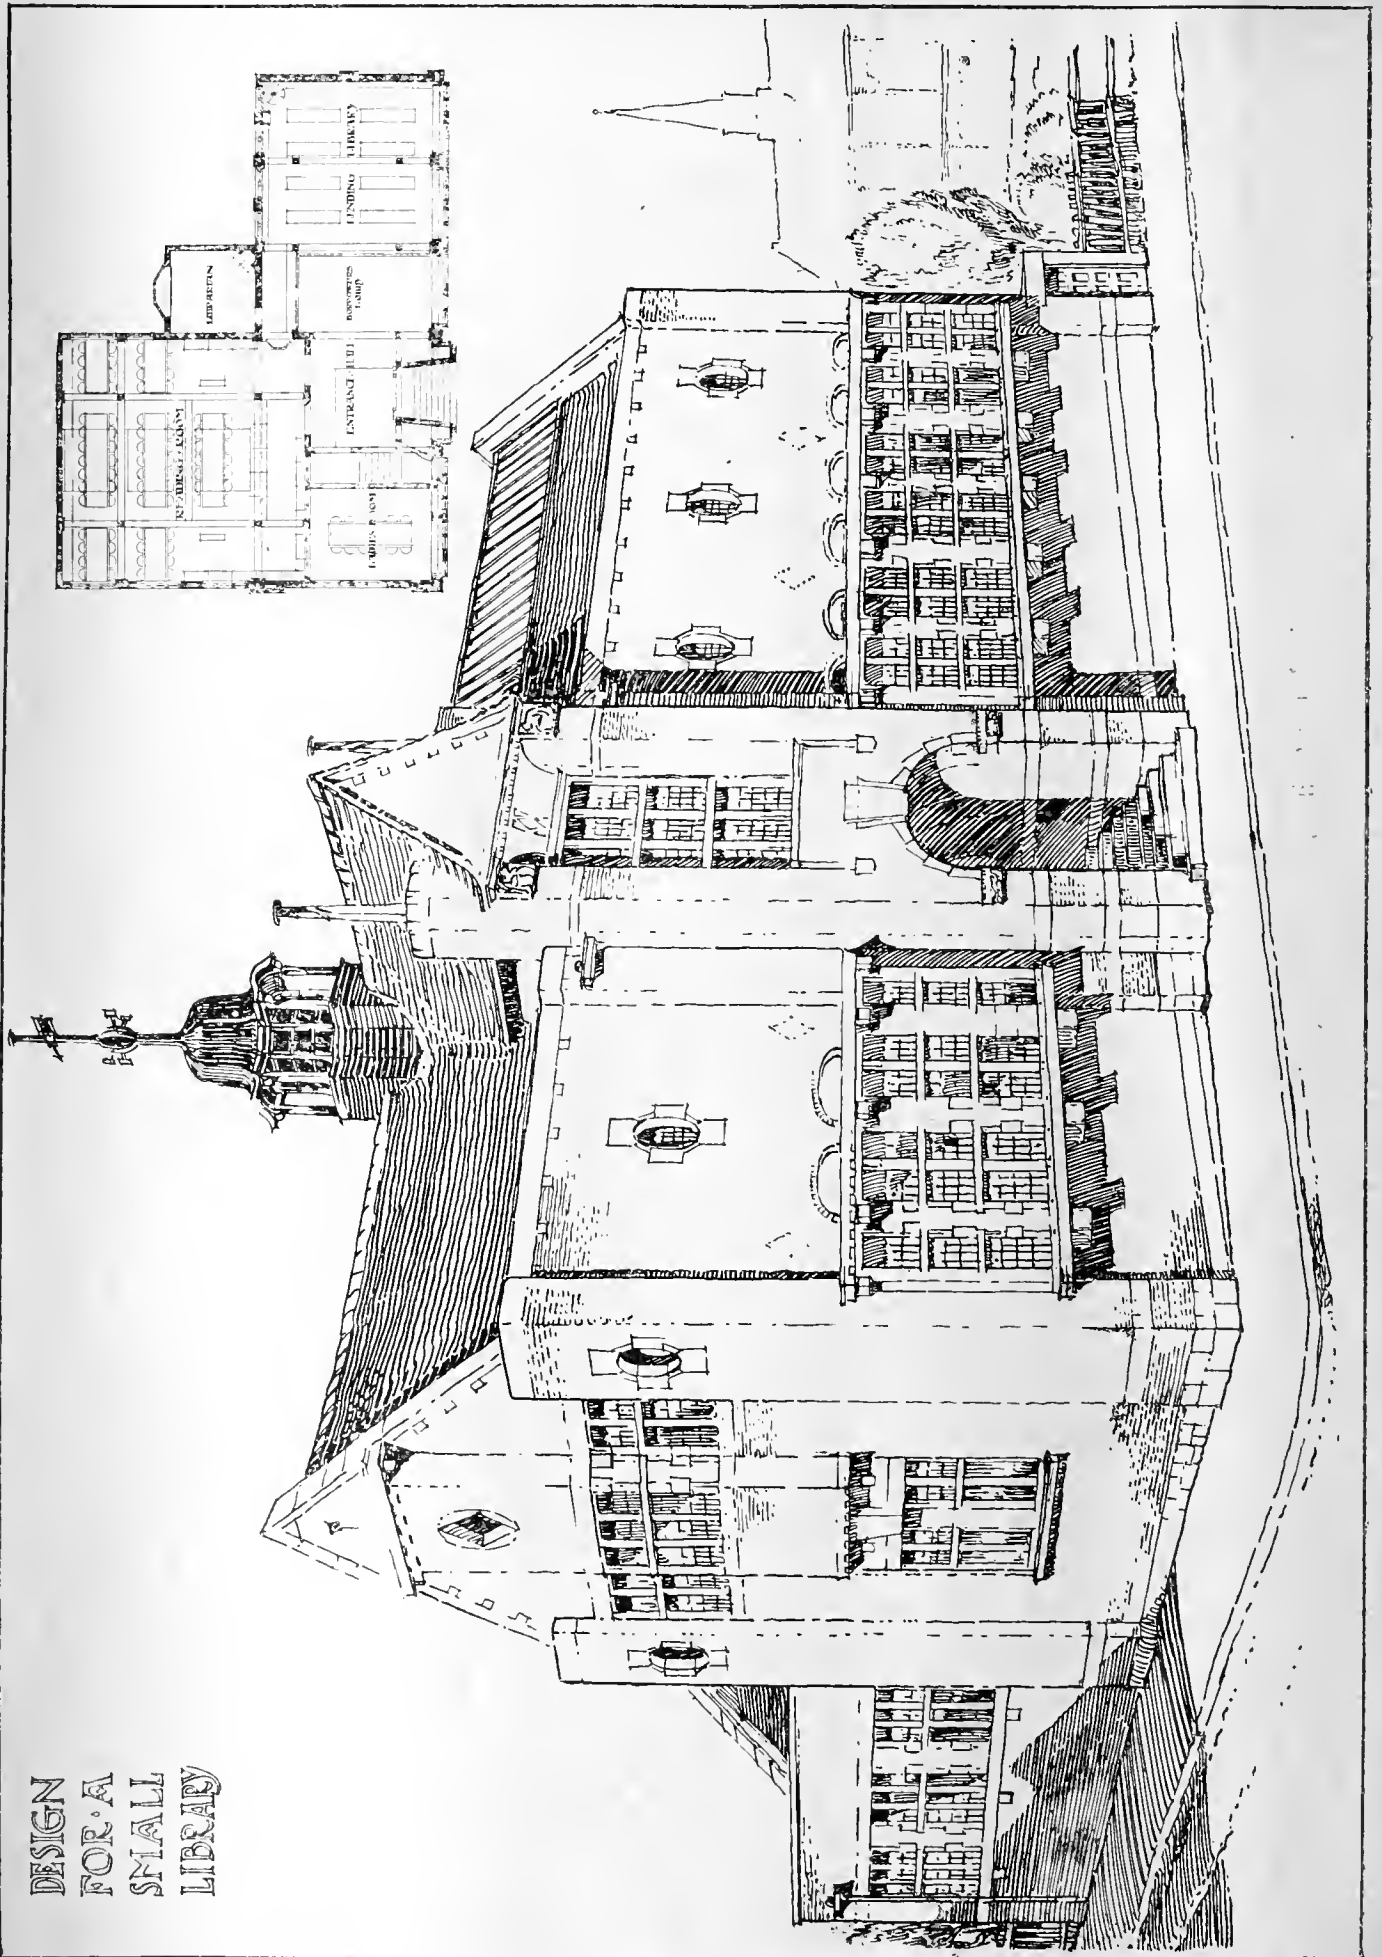

The Fulham Borough Council have decided to spend £362 in the redecoration of the town-hall buildings, which it is proposed to extend.

Mr. H. Ross Hooper, an inspector under the Local Government Board, has held an inquiry at Cotchester into the application of the council for sanction to borrow £6,933 for purposes of electric lighting.

According to a request by the Holborn Borough Council, the Benchers of the Honourable Society of Gray's Inn have generously determined to pull down the north wall of their gardens, which at present shuts out all view of the same from Theobald's-road, and replace it with a dwarf wall and handsome iron railing. This alteration has been decided upon "as an earnest of the Benchers' desire to add something to the amenities of the Borough of Holborn, of which Gray's Inn now forms part."

The adjudication in bankruptcy against Benjamin Haynes, of Penge, S.E., builder, has been annulled on the payment of debts in full.

At the last meeting of the Glasgow Corporation Lord Provost Primrose intimated that an organ, costing £2,000, would be placed in the Springburn Halls, half of the money being subscribed by Mr. Hugh Reid, Springburn, and half by Mr. Carnegie.

STATUES, MEMORIALS, &c.

CANTERBURY CATHEDRAL.—At a meeting of the late Dean Farrar's friends, held at Canterbury on April 21, it was decided that an executive committee should be formed, and should be empowered to determine the form which the memorial to the Dean should take. The executive committee met on Wednesday in the Jerusalem Chamber, Westminster Abbey, under the presidency of Viscount Peel. It was reported that £180 had been collected before any public appeal had been made. It was resolved that, in the event of the necessary funds being obtained, the memorial to the late Dean of Canterbury should take the form of carrying into effect his design for filling the west window of the Chapter House of the cathedral with coloured glass to match the east window, and of completing certain details in the restoration of the Chapter House.

ONICH, N.B.—The memorial to the late Rev. Dr. Stewart, "Nether-Lochaber," was unveiled at Onich, on Loch Linne, opposite Ballachulish, on Saturday. The monument consists of a Celtic cross, something after the style of the famous St. Martin's cross at Iona Cathedral. From the base to the top it is about 20ft. high, and is richly decorated with Celtic lacework. It is not to be placed in the churchyard, but on a knoll or rock by the roadside at Onich, not far from the manse which was long occupied by Dr. Stewart. The position chosen is a very commanding one, looking away down Loch Linne on the one side and up Loch Leven on the other. There was a competition for the memorial, and the commission was secured by Messrs. Gray and Co., 460, Sauchiehall-street, Glasgow.

CHIPS.

Mr. T. P. O'Connor, M.P., will unveil the Robert Buchanan Memorial in the churchyard of St. John the Baptist, Southend, on Tuesday next.

The preamble of the Bill authorising the Corporation of Cardiff to construct additional lines of tramway has been passed in the House of Commons.

The new United Methodist Free Church and Sunday-school erected at Tarsat, at a cost of about £600, were formally opened on Saturday. The building has an open roof of pitch-pine, and is seated with pitch-pine seats. The contractors were Mr. Thos. Weightman, Lane Head, and Mr. Lawson, Greenhaugh.

A marble bust of Chaucer, by Mr. G. H. Frampton, R.A., and now on view at Burlington House, has been presented to the London City Corporation by Alderman Sir Reginald Hanson, and will be placed in the Guildhall Library.

On Wednesday week the Bishop of Dover dedicated the lych-gate which has been erected at the western entrance to the Abbey Churchyard, Minster, in Sheppey, as a memorial of the coronation of King Edward VII.

The foundation-stone of the church of St. Michael and All Angels, Foulridge, in the parish of Christ Church, Colne, Lancashire, was laid on Saturday by Mr. W. W. B. Hulton, Constable of Lancaster Castle. The church is a simple rendering of Early Perpendicular from designs by Mr. R. Bassnett Preston, A.R.I.B.A., of Manchester.

The Hunts County Council, at their last meeting, agreed to raise the salary of Mr. Leete, the county surveyor, from £300 to £500 a year.

The museum and school of art committee of the Birmingham Corporation have unanimously appointed Mr. Arthur J. Gaskin as headmaster of the Vittoria-street School for Jewellers and Silversmiths, in succession to Mr. R. Catterson-Smith, recently appointed headmaster of the central and branch schools.

A Worcestershire County Council inquiry was opened at Evesham on Monday in regard to an appeal by the local Town Council for steps to be taken to restore the navigation of the Avon between Evesham and Cleeve Mill. Mr. S. R. Locock, civil engineer, Westminster and Birmingham, described the scheme adopted by the corporation. At Lower Harvington, where the weir was washed away, it was proposed to construct a weir 2ft. 6in. The height when the navigation was in existence was 3ft. more than that, so that there would be no danger of flooding the meadows, particularly as the banks were high. The total cost of the scheme would be £1,532, or, with a bridge instead of the raised ford, lock, and sluices at the Fish and Anchor, £6,400. Mr. Henry Evershed, engineer, Rushford, gave similar evidence. The scheme was opposed on behalf of the riparian owners, and the inquiry was adjourned.

The Primitive Methodist Church, Pittshill, Tunstall, Staffs, was reopened on Thursday in last week, after redecoration and the building of a new organ. The organ has been built by Messrs. Steele and Keay, Burslem, at a cost of £375, and the other improvements, including the addition of a vestry, have cost £200.

LEGAL INTELLIGENCE.

TRADE UNION LAWSUIT.—DAMAGES AGAINST A SOCIETY.—At Manchester Assizes on Wednesday was continued the trial of an action brought by Mr. James Carr, master painter and decorator, to recover damages from the National Amalgamated House and Ship Painters and Decorators and Frank Lowe, delegate of the society, who the plaintiff alleged had unlawfully induced persons to break contracts with him and not to enter into contracts with him, and who, further, had conspired together to injure him. The defendant Lowe, in the witness-box, admitted that he did Carr out of the job of painting one of the corporation tramcar sheds by lodging a complaint that an unfair house had tendered, and threatening that if Carr got the job he would withdraw all the society's men from any work for the corporation. The judge put to the jury a number of questions in writing. In answering they found that the defendants had in specific instances conspired maliciously and with intent to injure plaintiff, and had procured workmen to leave his employment and continue away from it, and had prevented a firm of builders from accepting the plaintiff's tender, and, further, had prevented and obstructed him from carrying on his trade. The damages were assessed at a total of £332. Commissioner Bray gave judgment for the plaintiff.

BUILDING BY-LAWS PROSECUTION.—A special meeting of the Coventry magistrates was held recently to deal with twenty-nine summonses that had been issued against William James Bromley, 103, Holyhead-road, for alleged breaches of the building by-laws in the erection of houses in King Edward's-road and Coronation-road. In thirteen cases affecting the Coronation-road buildings it was alleged that the walls inclosing the houses were put together with mortar which was not good, whilst in the King Edward's-road cases it was asserted defendant did not have the dividing walls, which were set at right angles to the front wall, properly bonded. Mr. Parfitt, for the defence, contended that defendant had used well compounded mortar, and that the city engineer had taken an incorrect view of what the material was composed of. Because accidentally a contemptible quantity of roots and vegetable matter might have been mixed up with the mortar, it was suggested that it was of improper quality. He urged that the Bench should not pay too much attention to the by-laws made by men who knew little or nothing of the commercial side of the question. Defendant and numerous other witnesses were called to give evidence of which the purport was that the mortar was good. It was arranged to take the Coronation-road houses summonses next week, and in the cases gone into at much length on Friday the Bench said they were of opinion that the mortar used was not in accordance with the requirements of the by-laws, and therefore fined defendant 40s. and costs. The evidence was accepted as binding on the other cases, in each of which a nominal fine of 1s. and costs was imposed.

SERIOUS CHARGE AGAINST AN ARCHITECT'S ASSISTANT.—Before the Wrexham Borough magistrates on Friday, Lewis Henry Cooke, architect's assistant, pleaded guilty to having forged a cheque for £9 6s. 4d., and also to having fraudulently obtained that sum by means of the cheque. The evidence showed that Cooke had been five weeks in the employ of Mr. Slater, architect. On July 7, Mr. Slater learned that a cheque purporting to bear his signature had been passed to Parr's branch bank at Wrexham from the North and South Wales Bank for payment. The cheque did not bear his signature, and it was found that it had been cashed by Mr. Owen Pritchard, boot and shoe dealer, with whom prisoner lodged, and who, believing it genuine, had cashed it. Prisoner was received by Inspector Bagshaw from the Winchester City Police, he having given himself up there. He was committed for trial.

The office of borough engineer and surveyor and waterworks engineer to the corporation of Sudbury is vacant, Mr. T. W. A. Hayward, after six years' work in that position, having just been appointed borough surveyor and engineer of Stamford from 196 applicants. Mr. Hayward is also retained as consulting engineer at Sudbury, by which corporation he has been presented with a honorarium of £450.

Sir William Broadbent laid, on Tuesday, the foundation-stone of an administrative house, the gift of Mr. J. Passmore Edwards, at Chalfont Epileptic Colony. Sir William read the following telegram from the Prince of Wales, President of the National Society for the Employment of Epileptics:—"I heartily congratulate the Chalfont Epileptic Colony upon the ceremony in which you are to-day assisting. I trust that the good work of the institution may be largely extended by means of the new buildings which are to be erected through the liberality of Mr. Passmore Edwards, and the foundation-stone of which will be laid by you to-day."

PARLIAMENTARY NOTES.

PROPOSED MILITARY WORKS.—Mr. Brodrick moved in Committee on Tuesday a resolution authorising a loan of £5,000,000 for the construction of military works. The money, he stated, was required for the completion of defence works which Parliament had agreed to; for providing housing accommodation for troops in this country and hutting accommodation for the 25,000 men who were to be stationed in South Africa, estimated to cost £2,500,000; for the erection of storehouses for the reserve of stores, and for providing training grounds and rifle ranges. For this last purpose a sum of £700,000 was wanted. The Secretary for War stated subsequently that the Bill based on the resolution would be put down for discussion on Friday (to-day). The resolution was agreed to.

CHIPS.

Lord Monkswell, on Saturday, opened Fulham Park extension to the public. On the south Fulham Park, including the additional strip of land dedicated to the public, is bounded by the Fulham reach of the Thames, and on the north by the Bishop's Moat. The added portion contains a lake which almost surrounds a square of grass, which will be used as a croquet lawn or bowling green. The lake is fringed on the east side by a children's sandbank. The borough engineer, Mr. F. Wood, has carried out the whole of the works of design, construction, and supervision of the extension.

The laying of the memorial-stones for the Corporation-road infant school at Darlington took place on Friday. The new schools will accommodate 219 infants, and will cost about £3,832.

The dedication of the tower and bells of Ridlington Church, after restoration, took place on Monday. The work done includes recasting and rehanging the bells; rebuilding the upper part of the tower, by Messrs. Dalby and Sons, Uppingham; and erection of an oak belfry screen from the designs of Mr. W. Talbot Brown, of Wellingborough, by Messrs. Stanon and Sons, of Ketter. The tracery of the latter and also an oak reredos were carved by the rector.

The new cope presented to Truro Cathedral for the use of the bishop of the diocese is of cream and gold damask, with richly embroidered red hood and orphreys, designed by Messrs. Bodley and Co., and is the work of the Community of the Epiphany, Truro.

The new post-office at Oundle was opened on Monday. It has been built by Messrs. Siddons and Freeman, contractors, of Oundle.

On Wednesday week, two memorial windows, erected in St. Mary's Church, Stretton, by Mr. John Gretton, M.P., and Mr. F. Gretton, to the memory of their father, were unveiled and dedicated. The windows were designed by Sir William B. Richmond, and represent the Ascension and the assembly in the upper room at Jerusalem on the Day of Pentecost.

Mr. John Caxton Lawrie has been appointed president of the Sanitary Inspectors' Association of Scotland.

The foundation-stone was laid on Saturday of the new chancel now being built in connection with St. Martin's Church, Brighouse, and estimated to cost £1,000.

Mr. H. W. Richards has been appointed principal of the London County Council Brixton Technical Institute. The institute, which will be opened next session, is situated in the Ferndale-road, Brixton, on a site formerly occupied first by a polytechnic and then by public baths, both of which proved unremunerative in working. It is intended to be an important centre for instruction in building trades. Mr. Richards has had wide experience both in practical building work and in teaching building trade subjects. For many years past he has been engaged in teaching in the evening classes at polytechnics and technical institutes, and for the past seven years he has held the position of head of the building trades department at the Northern Polytechnic, Holloway.

The Rochester and Chatham Tramways Bill has been passed by a committee of the House of Commons, having already gone through the House of Lords. The tramways to be constructed by the Rochester Corporation are wholly within the boundaries of that city. A number of street widenings and improvements are contemplated, the total cost of the scheme being estimated at £140,557, of which £66,109 is for the construction of the tramways, inclusive of the overhead electrical equipment and the distributing cables. The main proposals of the company are the construction of a new tramway, three and a half miles long, from Chatham to Rainham, and one from Chatham to Maidstone, a distance of about seven miles. The line from Chatham to Maidstone, the estimated cost of which is £63,555 is to be laid chiefly on private land, and not on the public highway.

Our Office Table.

MR. ROBERT BOYLE, who was the proprietor of over four-fifths of the shares in the firm of Robert Boyle and Son, Ltd., the pioneers of sanitary ventilation, of 64, Holborn Viaduct, London, E.C., and 110, Bothwell-street, Glasgow, having acquired the remainder, the business will henceforth be carried on by him under its original title of Robert Boyle and Son. As the business has always had the benefit of Mr. Boyle's world-wide experience and close personal superintendence, the only change, if any, will, we are sure, be the still greater confidence of its numerous patrons in this old-established undertaking, for the continued and progressive activity of which Mr. Boyle assumes the whole financial responsibility.

MR. WALTER RYE, F.S.A., calls attention to an unjustifiable act of vandalism that is being perpetrated by the Dean and Chapter of Norwich at Bishopgate, at the north-eastern angle of the cathedral precincts. "Fronting Bishopgate and inclosing the lower precinct is," says Mr. Rye, "a fine massive flint wall 2ft. 6in. thick, and probably 600 years old. A great length of this is now being pulled down and a row of red brick villas being erected, which form a terrible eyesore, and constitute a bad foreground to the cathedral behind them. Six houses are to be built, and as the ground rent obtained by the Dean and Chapter is 25s. per house only, the annual increase of revenue to them amounts to the paltry sum of £7 10s. per annum, a very poor equivalent for the loss of the amenities and the erection of a hideous eyesore. Nor is this all, for the Dean has recently cemented over a great piece of the interesting flint house in which he lives, within a few yards of the south door of the cathedral, with brilliant smooth cement, the precinct walls opposite St. Helen's Hospital are still used as advertising stations, and an ugly corrugated zinc fence still abuts on the west front of the Cathedral. That a quasi-public body like the Dean and Chapter should act like this is little less than a scandal." We should be glad if Mr. C. J. Brown, the architect to the Dean and Chapter, can state that Mr. Rye, who is invariably reliable as to his facts and data, has for once been misinformed.

THE London County Council has met the criticism of the Strand improvement design in a courteous spirit, and in addition to postponing for three months the sale of the land which would be required for proper treatment of the street, it has erected on the site several lines of scaffold poles along which have been affixed white bands which show the different lines of frontage proposed. The public can now, on visiting the spot, judge the value of the new proposals, as well as the criticism bestowed on the original design. The best mode for taking in the matter at a glance is to stand on the corner of the pavement at the point where the carriage drive enters the gardens to the west of the Law Courts. From this point the different schemes can be easily compared.

THE Improvements Committee of the London County Council will shortly bring before the Council for approval a scheme for an important widening of Piccadilly on its north side, between Piccadilly-circus and Sackville-street. The Commissioners of his Majesty's Woods and Forests are the freeholders of nearly all the property needed for the improvement, and a satisfactory arrangement has been arrived at between the committee and the Commissioners for the addition to the public way between Piccadilly-circus and Sackville-street of a strip of Crown land necessary to enable the Council to widen Piccadilly to a total width of 80ft., in consideration of the payment by the Council of a total compensation of £200,000, which the committee are advised is a reasonable amount. The improvement is to be divided into sections, and although the Council is to be asked to sanction the scheme as a whole, the only sections that can be dealt with during the next few months are those between Swallow-street and Piccadilly-place and between Piccadilly-place and Air-street, for which the Council is required to pay H.M. Office of Works £95,000. It will not be necessary to obtain Parliamentary powers for the improvement, as it would be carried out by agreement. The Westminster City Council is to be asked to contribute £10,000, one-fifth of the net cost of the widening. A proposal will also shortly be brought before the London County Council by the Improvements

Committee for the widening of Sloane-street at its northern end, between Brompton-road and Basil-street, where the width of the road hardly exceeds 40ft. The scheme is to widen this to 60ft., which is the width of the road south of Basil-street. The cost of the acquisition of property works out at £60,000, towards which the Chelsea Borough Council has offered to contribute £20,000.

THE lectures on Architectural History given by Mr. Banister Fletcher, A.R.I.B.A., and arranged under the auspices of the Board to Promote the Extension of University Teaching of the University of London, held during the past session, have been very successful. The total number of students who entered for the course was 63, and at the examination held at the conclusion of the course 11 students satisfied the examiner (Professor W. R. Lethaby, of the Royal College of Art), and six of these qualified by examination for the Sessional Certificate in Honours. The names of the successful students are: Frank L. Atwell, Arthur E. Colman, *Albert T. J. Harris, John L. Howland, *Frederick G. Pain, Albert A. Reeve, Gerald G. Rogers, *Charles J. Smith, *Ada M. Warren, *Emily M. B. Warren, and *Ernest A. Weston. Those with an asterisk against their names qualified for the Certificate in Honours. The scheme of instruction consisted of weekly lectures (at which carefully-selected notes were given out), illustrated with lantern slides and specially-prepared large lecture diagrams, followed by sketching classes and further explanations of the styles under discussion, which were also rendered more easy to understand by large folio reference books for each style. The majority of students were architects' assistants, pupils, and art students; but a considerable number of students interested in architecture as a necessary part of education were present, especially those who are in the habit of travelling, or who are interested in historical development. An innovation will be introduced during the coming session, which opens at the Chelsea Polytechnic on Monday, October 5, at 7 o'clock, as a series of visits are being arranged to important buildings and museums around London, so that a student may be able to become acquainted with the actual details of architecture, which is impossible to be obtained in a lecture-room only.

THE annual report of Mr. Charles Welch, the Guildhall librarian, states that 4,813 additions of manuscripts, printed books, pamphlets, maps, prints, &c., were made to the library last year, of which 3,300 were donations. The time is not far off when the furnishing of the library will demand serious consideration. At recent sales several volumes of scarce parish registers and family histories and the remaining volumes of Gregory's MSS. collections for the "Lives of the Lord Mayors of London" were purchased. On the demolition of Newgate the museum received as gifts a whipping-post, four chairs from the chapel, iron manacles and waistbands for securing refractory prisoners, and a bust of Sir John Silvester, Recorder of London, 1803-22, who was known among the prisoners as "Black Jack of the Old Bailey." The expenses of the library and museum amounted to £6,575. The art gallery, according to the report of the director, Mr. A. G. Temple, F.S.A., was open 249 days, and attracted 20,872 visitors. During the year the City had received the famous Gassiot collection of 127 pictures worth £90,000. The expenses of the art gallery had been £3,120.

THE Welsh slate industry has found a threatening rival in the British island colony of Newfoundland, where quarries are being worked by American capital and by men hailing originally from the neighbourhood of Bethesda and Penrhyn, Carnarvonshire. Lord Penrhyn and his manager will be interested to learn that the Riga iron barque *Delta* arrived in the Tyne on Friday from Newfoundland, bringing for Mr. John Hewitson, of Newcastle, a full cargo of slates, 870 tons, green and purple, after a smart passage of 21 days. The *Delta* is the fourth vessel to land slates imported from Newfoundland from the quarry which has recently changed hands. This quarry is receiving new and the latest machinery, and wharves have been erected for loading sailing ships. It is expected that the output of slates this year will be treble that of last year, and large quantities, it is anticipated, will be sent over to England. As the Welsh slate quarries cannot supply the demand of the trade, and have raised their prices this year 10 per cent., it is expected in

the codfish colony that Newfoundland slates, which are said to be of excellent quality, will go far towards meeting the requirements of the market.

Trade News.

WAGES MOVEMENTS.

MANCHESTER.—At a mass meeting of Manchester French-polishers, who are out on strike, it was unanimously decided to refuse the masters' terms of 8d. per hour. The men want 8½d. per hour.

SUNDERLAND.—The Mayor of Sunderland, Councillor H. J. Turnbull, has offered to act as mediator in the Sunderland joiners' strike. His worship's letter has been formally acknowledged, but no steps in the matter will be taken until the parties have held further meeting.

CHIPS.

On Sunday a memorial to John Boyle O'Reilly, poet and journalist, of Boston, Mass., who died in 1890, was unveiled at Dowth, near Drogheda, by Father Anderson, O.S.B. The monument is in the form of a Celtic cross standing 14ft. high, with an appropriate inscription in Gaelic. Above the inscription is a marble bust of Boyle O'Reilly, while on either side are emblematic figures representing Erin and America.

A memorial was unveiled on Sunday in St. Peter's Collegiate Church, Wolverhampton, to local men who served in the war in South Africa. The memorial is in the form of a cartouche of veined alabaster, convex on the face, with richly-carved surroundings, the whole being mounted on a slab of Californian onyx. The tablet has been placed on the wall of the north aisle, near the vestry door, and facing the south entrance.

Memorial-stones of a Methodist Sunday-school were laid at Bethesda Chapel, Kynsham, Bristol, last week. The schools will be faced with Pennant stone, with Bath stone dressings, and will measure 65ft. by 30ft. Mr. H. Harding is the builder.

The City Corporation at their last meeting adopted a report of the Improvements and Finance Committee as to the throwing open of the remaining portion of the ground on the north side of Cripplegate Church, with a view to enable that side of the church to be restored and a statue of John Milton erected, on the parochial authorities paying the City £1,500.

Princess Henry of Battenberg opened on Monday the Belgrave Hospital for Children, Clapham-road. The hospital was formerly housed at Pimlico, but has been removed thence and built on the present site, next St. Mark's Church, Kennington-gate. The amount spent upon the building thus far has been £30,000, and in addition to that £4,000 was expended in the purchase of the site. It has been erected from designs by Mr. H. Percy Adams, F.R.I.B.A., of Woburn-place, and was illustrated by a perspective and plans in our issue of August 10, 1900. The elevations are faced with Lawrence's red bricks, with Portland stone dressings.

A fire broke out on Sunday at the timber works and sawmill of Messrs. Meanell, Clarkson, and Co., of Norton, Malton, by which the main building and its contents were destroyed. The damage is estimated at £5,000, the building being insured, but not the stock.

The Mayor of Newport, Mon., opened on Friday a new wing pavilion erected to extend the accommodation of the Corporation Infectious Diseases Hospital at Allt-yr-yn. The cost of this extension has been £10,145, and provision is made for 22 beds.

The Leeds Corporation Improvements Committee have recommended the city council to advance the salary of Mr. Towers, the building inspector, from £350 to £400 a year.

ESTIMATES GIVEN ON APPLICATION.

LIST OF COMPETITIONS OPEN.

Stonehaven—Additions to Town Hall	George Murdoch, Burgh Surveyor, Stonehaven, N.B.	Sept. 12
Bromley, E.—Public Library	Harley Heckford, A.M.I.C.E., Boro' Sur., High-street, Poplar, E.	Oct. 2
Rawtenstall—Free Library and Town Hall (Assessor)	A. W. Lawson, A.M.I.C.E., Boro' Surveyor, Rawtenstall.	12
Vienna—Machinery to Lift Boats	The Austro-Hungarian Consulate-General, 22, Laurence-Pountney-lane, E.C.	(1904) Mar. 31
Cloverhill—Infectious Diseases Hospital	David W. Shaw, District Clerk, 5, Wellington-square, Ayr.	—
Acton, W.—School (250 places, (Assessor)	B. S. Gott, Clerk to Governors, Guildhall, Westminster.	—

LIST OF TENDERS OPEN.

BUILDINGS.

Walton-le-Dale—Church	Building Committee	John P. Seddon, Architect, The Vicarage, Walton-le-Dale, Preston July 25
Rothie-Norman—Bark House	Wesleyan Trustees	R. G. Wilson, Architect, 181A, Union-street, Aberdeen
Hafod—Chapel and Schoolroom	Guardians	Arthur O. Evan, Pontypridd
St. Neots—Additions to Infirmary at Workhouse	School Buildings Club	S. Inskip Ladds, A.R.I.B.A., Market-place, Huntingdon
Londonderry—Additions to Workhouse Infirmary	Corporation	M. A. Robinson, M.R.I.C.E., M.S.A., Richmond-street, Londonderry
Hull—Classrooms at St. George's-road P.M. Schools	Canon C. Blackett-Ord	T. Beecroft Atkinson, Architect, 11, Trinity House-lane, Hull
Waulwylwyd—Twenty Houses	Aberdeen Commercial Co., Ltd.	R. L. Roberts, Architect, Abercrombie
Cerne, Dorset—External Repairs to Workhouse	Town Council	J. Peacey, Architect, South Walks, Dorchester
Londonderry—Main Entrance to Victoria Market	Rural District Council	The City Surveyor's Office, Guildhall, Londonderry
Rothbury—New Farmhouse at Glebe Farm	Twyn Carno Building Club	W. R. Hindmarsh, Architect, Alnwick
Duffryn Gwaun—Rebuilding Jabez Chapel	School Board	G. Morgan and Sons, Architects, Carmarthen
Peterhead—Premises, Jamaica-street	Rural District Council	Jenkins and Marr, Architects, 16, Bridge-street, Aberdeen
Chelmsford—Library, Museum, and School of Art	Guardians	Chancellor and Son, High-street, Chelmsford
Limavady—Two Cottages, Drumsmurn	Clements and Short	William Crawford, Clerk, R.D.C. Offices, Limavady
Rhymney—Ninety-one Houses	Highways Committee	T. Roderick, Architect, Glebeland, Merthyr Tydfil
West Hartlepool—Upper Grade School (1,200 places)	Devon County Council	Richard Holt, Architect, Liverpool
Rathdrum—Repairs to Two Labourers' Cottages	Aldie & Co. Bridge Tramways Co.	S. G. Gallagher, B.E., C.E., Corballis Castle, Rathdrum
Aberdeen—Farm Steading at Blair of Bourtlee	Urban District Council	L. McKinnon, Advocate, 23, Market-street, Aberdeen
Dartford—Wards and Buildings at Workhouse	Corporation	G. H. Tait, Architect, Lowfield-street, Dartford
Amble—Alterations to Post Office	County Council	J. Wightman Douglas, 1, St. Nicholas Buildings, Newcastle-on-Tyne
Leeds—Additions and Alterations to Offices	Graig Rhymney Building Club	William Bruce, Architect, Greek-street Chambers, Leeds
Exeter—Offices at the Castle	Wesleyan Committee	E. H. Harbottle, County Architect, Exeter
Coatbridge—Car Shed, Main-street	Corporation	The Construction Eng., Brit. Elec. Trac. Co., 1, Adelphi-ter., W.C.
Sale—Cemetery Lodge at Brooklands	County Council	W. Holt, Engineer, Council Offices, Sale
Dublin—Repairs to Marlborough-street Training College	Urban District Council	J. Franklin Fuller, F.S.A., Architect, Dublin
Tiphril—Twenty-eight Houses	Corporation	T. Roderick, Architect, Glebeland, Merthyr Tydfil
Colchester—Tramcar Shed	Parks Committee	H. Goodyear, A.M.I.C.E., Boro' Eng., Town Hall, Colchester
Worthing—Fire Station, &c.	Hackney Union Guardians	Wm. Verral, Town Clerk, Municipal Offices, Worthing
Durham—Education Offices	Elham Rural District Council	W. Crozier, A.M.I.C.E., County Surveyor, Shire Hall, Durham
Newton Abbot—Alterations at Scattered Homes	Ed. H. But, J.P.	Samuel Segar, F.I.A.S., Architect, Union-street, Newton Abbot
Cleethorpes—Lodge, &c.	Borough Council	Egbert Rushton, Engineer, Poplar-road, Cleethorpes
Portsmouth—Discharge Block at Infectious Hospital	Guardians	Alexander Hellard, Town Clerk, Town Hall, Portsmouth
Hull—Park-keeper's Lodge, East Park	Admiralty	J. H. Hirst, City Architect, Town Hall, Hull
Merthyr—Cottage and Lodging-House, Riverside	R. Emmerson and Sons	C. M. Davies, 112 High-street, Merthyr
Chipping Ongar—Children's Homes	W. A. Finch, Architect, 76, Finsbury-pavement, E.C.	W. A. Finch, Architect, 76, Finsbury-pavement, E.C.
Lymington—Coach-House at Sanatorium	W. Ames, Surveyor, Elham	F. W. Ridgway, F.R.I.B.A., Borough Chambers, Dewsbury
New Mill—Enlarging Tenterbill	H.M. Commissioners of Works	Empsall and Clarkson, Architects, 7, Exchange, Bradford
Esholt—Two Houses	Jacob Thomlinson, Ltd.	J. Bower, Borough Surveyor, Town Hall, Gateshead
Gateshead—Stables, Tyne-road East	Guardians	Joseph Shepherdson, Architect, Driffield
Driffield—Additions to Workhouse Infirmary	Town Council	R. C. Jenkins, Architect, Cefn Coed
Abercrombie—Additions to Shop and House	Borough Council	Charles Jones, M.I.C.E., Engineer, Town Hall, Ealing
Ealing, W.—Slipper Baths, Williams-road	Corporation	John Morgan, Secretary, 68, Robert-street, Ynysybwl
Ynysybwl—Restoring Noddfa Welsh Baptist Chapel	School Board	J. Bower, Borough Surveyor, Town Hall, Gateshead
Gateshead—Stables, Tyne-road East	Pleasant View Building Club	The Borough Surveyor's Office, 15, Market-place, Devises
Devises—Converting Town Hall into Public Offices	Guardians	J. S. Moffatt, Architect, Church-street, Whitehaven
Whitehaven—Rebuilding No. 12, Duke-street	Admiralty	T. R. Atkinson, Architect, Earlston, N.B.
Gordon—Headmaster's House	R. Emmerson and Sons	T. Roderick, Architect, Clifton-street, Aberdeen
Aberaman—Seventy-two Houses	W. Butler	W. Beddoe Rees, A.R.I.B.A., 37, St. Mary-street, Cardiff
Glyncorrwg—Rebuilding Nebo Congregational Chapel	H.M. Commissioners of Works	The Clerk of Works, Guardians' Office, Mallow
Mallow—Repairs at Workhouse	Jacob Thomlinson, Ltd.	The Director of Works, Admiralty, W.C.
Hayling Island—Coastguard Station	Guardians	L. H. Armour, 16, West-street, Gateshead
Gateshead—Rebuilding Causey House	Gas Committee	John Gough, Architect, 28, Craven-street, Charing Cross
Walton-on-Thames—Cottage Hospital	Croydon School Board	Peter Frater, Howden-le-Wear
Stanley—House, Mount Pleasant	Bryngoleu Building Club	The Secretary, H.M. Office of Works, Storey's Gate, S.W.
Kew Gardens—Reconstructing Old Herbarium	Steam Laundry Co., Ltd.	C. Eaglesfield, Architect, Maryport
Maryport—Warehouse	G. Bell, J.P.	F. W. Lockwood, Architect, 91, Victoria-street, Whitehead
Whitehead—Two Houses and Shops	Markets Committee	The Clerk of Works, Guardians' Office, Mallow
Mallow—Repairs to Kilsbannig Dispensary Residence	Parish Council	Fletcher W. Stevenson, Engineer, Gasworks, Coventry
Coventry—Sulphate House, &c.	Mrs. Edwards	Barrow Rule, Clerk, Katherine-street, Croydon
Thornton Heath—Schools (1,230 places), Ingram-road	London County Council	W. A. Lloyd, Secretary, 20, Elm-street, Farnham
Ferndale—Forty-one Houses	C. Edwards's Brewery, Ltd.	G. C. Hillard, Architect, Market Chambers, Abertillery
Abertillery—Steam Laundry	L. & N.W. & G.W. Jt. Railways	H. Hobart, Architect, Dromore, Co. Down
Hillsborough—House	Trinity Corporation	W. Chapple Eddowes, Borough Surveyor, The Square, Shrewsbury
Shrewsbury—Covered Cattle Sale Ring	English Wesleyans	J. Cowan, A.M.I.C.E., 179, West George-street, Glasgow
East Kilbride—Cemetery Works	H.M. Commissioners of Works	H. Hill, Dyon Side, Distington
Distington—Enlarging Dyon School	School Managers	B. J. Francis, Architect, Abercrombie
Gilwern—Additions to Corn Exchange Inn	Admiralty	The Housing Section, Archt.'s Dept., 18, Pall Mall East, S.W.
Brickfield Gardens, N.E.—Bandstand, Conveniences, &c.	Guardians	B. J. Francis, Architect, Abercrombie
Gilwern—Nine-stall Stable at Navigation Inn	H.M. Commissioners of Works	A. E. Bolter, Sec. to Joint Committee, Paddington Station, W.
Shrewsbury—Railway Station	School Managers	Corderoy, Selby, and Corderoy, 21, Queen Anne's Gate, S.W.
Portland Bill, Dorset—Lighthouse Dwellings	Admiralty	Arthur O. Evans, Pontypridd
Ynysybwl—Chapel	Guardians	The Secretary, H.M. Office of Works, Storey's Gate, S.W.
Thornton Heath—Sorting Office	H.M. Commissioners of Works	F. G. Beeching, Clerk to Managers, Ashford, Middlesex
Ashford—Repairs to School Roofing	Grove Estate Building Club	The Director of Works, Admiralty, Northumberland-avenue, W.C.
Cemaes, Anglesea—Coastguard Station	Rev. L. P. Williams	P. J. Thomas, Architect, Bridgend
Bridgend—Infirmary at Workhouse	Corporation	The Secretary, H.M. Office of Works, Storey's Gate, S.W.
Crewe—Post Office	Hackney Union Guardians	J. W. Grundy and Son, Architects, Brodgen-street, Ulverston
Ulverston—Additions to Cottage Hospital	Corporation	Fisher and Sons, Architects, Club Chambers, Pontypool
Pontnewynydd—Forty Houses	Trustees	Joseph Potts and Sons, Architects, 57, John-street, Sunderland
Sunderland—St. Mary's Vicarage, Tyne Dock	Corporation	Smith and Cross, Architects, Town Hall Chambers, Rochdale
Bacup—Infant's School, Lam-head-lane	Phoenix Brewery Co., Ltd.	W. A. Finch, Architect, 76, Finsbury-pavement, E.C.
Homerton, N.E.—Scullery at Sydney-road Workhouse	School Board	A. Fidler, A.M.I.C.E., Boro' Eng., Guildhall, Northampton
Northampton—Carrs-heds, Workshops, &c.	Misses Cowherd	Anthony and Sons, Anchor House, Kidwelly
Kidwelly, Wales—Alterations to Calvinistic Methodist Chapel	J. R. and John Jacob	A. Fidler, A.M.I.C.E., Boro' Eng., Guildhall, Northampton
Northampton—Power Station Buildings	Phoenix Brewery Co.	Travers and Ramsden, Architects, 44, Church-st., Leigh, Lancashire
Newchurch—Rebuilding Church	Handsorth-Woodhouse Co-op. Soc.	J. Llewellyn Smith, Architect, Aberdeen
Troedyrh—Boys' School (400 places)	Frd Terry	Wm. Hope, Architect, Seymour-road, Hampton Wick
New Malden—Public Offices, Fire Station, &c.	School Board	Ivor James, Registrar, Brecon
Cardiff—Registry Offices	University of Wales	Garside and Pennington, Architects, Pontefract
Gildersome—Wesleyan Sunday Schools	Phoenix Brewery Co.	Wm. E. Gill, Architect, Derby Chambers, Fleet-street, Bury, Lancs
Bury—Offices at Green-lane Brewery	Handsorth-Woodhouse Co-op. Soc.	Gibbs and Flockton, Architects, 15, St. James-row, Sheffield
Driffield—Warehouse and Offices	Frd Terry	J. Robinson, Architect, Park Cottage, Wombwell
Wombwell—School	School Board	Wm. E. Gill, Architect, Fleet-street, Bury, Lancs
Heywood—Alterations at Infirmary Office	Misses Cowherd	John Stalker, M.S.A., Architect, Kendal
Cartmel—Altering House	J. R. and John Jacob	H. Tatham Sudbury, Architect, 18, Market-place, Ilkerton
Ilkerton—Congregational Church and Schools	Phoenix Brewery Co.	Habershon, Fawcoker, and Co., Architects, 14, Pearl-st., Cardiff
Cardiff—Three Shops and Offices	Handsorth-Woodhouse Co-op. Soc.	Robert T. Martin, 7, Wellington-place, Belfast
Belfast—Residing Presbyterian Church	Frd Terry	Wm. E. Gill, Architect, Fleet-street, Bury, Lancs
Heywood—Offices at Phoenix Brewery	School Board	Jowett Kendall & J. Harper Bakes, Architects, Victoria-sq., Leeds
Calverley—Engine-house at Ravencliffe Mill	University of Wales	G. Platts, Manager, Central Stores, Woodhouse
Beighton—Premises	Phoenix Brewery Co.	Jas. Simmonds, Hague-lane, Hemsforth
Hemsforth—Fifteen Houses	Handsorth-Woodhouse Co-op. Soc.	W. Mason Coggill, Architect, Stourton, Hunslet
Leeds—Five Houses and Shops, Harehills-lane	Frd Terry	John Jackson, Architect, Barry-street, Bradford
Westgate—Rebuilding Front of Elephant and Castle Hotel	School Board	F. B. Lewis, City Architect, Guildhall, Nottingham
Nottingham—Board School, Sneinton Boulevard	School Board	

THE BUILDING NEWS

AND ENGINEERING JOURNAL.

VOL. LXXXV.—No. 2534.

FRIDAY, JULY 31, 1903.

THE SOLUTION OF BUILDING PROBLEMS.

THE problem of how to plan economically and for specific purposes, and to construct on scientific and hygienic principles, is being attacked on various sides by scientific men and experts. Each body of expert explorers is trying to solve the problem in their own way, without any reference to other individuals who are doing the same thing. Thus, for instance, we have the sanitary expert laying down precise and absolute principles about drainage, warming, and ventilation, just as if these matters, important as they are, were supreme, to which all other considerations must give way. He deduces from certain facts and experiences rules which he thinks must be obeyed at all costs. For example, a certain theory of ventilation must be carried out, no matter how it conflicts with architectural design or proportion; the sanitarian thinks, indeed, that plan and architectural features must give way to the rules of sanitary science as understood. Take, again, the mechanical expert, who sees nothing but the design of a building being made to conform to its mechanical equipments, motors—mechanical plant and appliances for certain industries or manufacture; or the structural engineer, whose idea of design is that every portion of a building must be planned and arranged so as to give facilities for iron or steel construction—that the plan ought to be arranged by the engineer to suit the piers and columns, loads, length of girders, and other convenient stock lengths and sections. The engineer's method of solution is one that does not often accord with the architectural sense. He considers every part of the design must be in strict relation to the utilitarian purpose, even if such use compels him to abandon architectural appearances and rules, and to adopt unsightly features and proportions. To the barest mathematical result everything must be sacrificed. Then there is the specialist in a particular branch of architecture, who sees everything with the eyes of one who looks at a building from his own particular point of view, and studies it in plan and elevation to accord with the latest ideas of a theatre, a church, a hospital, a library, or a bath and washhouse. The specialist's idea is rather restricted on this account: he is not likely to take into consideration the conceptions of plan which commend themselves to the ordinary architect, or which, after all, may be better than his own in many respects. The regulation plan is everything, and, according to him, cannot be made mere perfect. Data derived from statistics are closely followed in plan, even where contradictory considerations tell against them. The specialist in fire-resisting construction is strongly wedded to ideas of steel and concrete, to modes of floor and staircase construction which are not generally disputed, and shuts his ears whenever any other system is broached. Thus the advocates of so-called "fireproof" methods cannot bring themselves to acknowledge any value in solid timber construction, however much can be proved in its favour from the fireman's experience. With them it is far more important that there should be cased steel beams and iron columns, metal, lath-and-plaster, or terracotta partitions, and metal sashes and frames, with wired glass, than that these things should be of the usual description found in brick or stone and timber construction. The expert in planning is also inclined to waive points of artistic

value. Considering only the question of plan, he is inclined to neglect the requirements of elevation and detail. In this respect he often, as we lately said, exhibits a want of the sense of proportion in his design. Good arrangement, excellent as it is, can be carried so far that external composition and grouping are lost sight of. No doubt it is a better way of attacking the problem than in the other cases we have mentioned, as plan really lies at the root of good design. The medical man and hygienist is no less exacting than the sanitarian in requiring his special knowledge and clinical experience to be observed. In hospital construction of the latest type we may observe the extreme importance attached to certain details, such as the rounding of all corners and angles between floors and walls, the avoidance of all square angles, edges, or crevices where dust or germs can accumulate in windows, fittings, and furniture; to certain kinds of impermeable and smooth wall and floor and ceiling surfaces, which can be easily cleaned and washed, and in the glazed surfaces of the furniture and plumbers' fittings. These requirements are certainly inimical to the art sense. A hospital ward, as sketched by Mr. Saxon Snell in his paper read at the Bradford Congress of the Sanitary Institute, is a bare and almost painful example of modern sanitary science as now understood by the medical profession. Other instances of solving the problems of modern building by scientific methods may be mentioned; but they all leave something to be desired not dreamt of in the philosophy of science. In the design and construction of buildings like hospitals, workhouses, labourers' cottages, and other institutions of an official and administrative kind, we owe much to the study and statistical researches of experts. Economy of construction and plan, and the conditions of health and safety against disease and fire have been promoted by their aid. Science has formulated methods of construction which cannot be disputed, even if they are not the most perfect and convincing from other points of view, or even, as they often do, set art at defiance. On these points there is something to say. Have these various solutions of modern architectural problems been of value to the art? Have they helped to improve architecture?—have they evoked any corresponding feeling for art? Has the artistic mind been responsive to scientific specialism? These are questions that largely rest with the profession. In each of these different ways valuable results have been obtained, but the general effect has been sometimes disastrous. Each of the many problems of municipal building has been attacked from one side only—the utilitarian or scientific, leaving the other sides of the problem untouched, and thus while it is true that many useful improvements in plan and construction have been made, the effect on each class of building has been to produce an imperfect and ill-balanced whole. The scientific and technical elements have been developed at the expense of the æsthetic. From the materials used in the walls, floors, and roofs down to the smallest detail of fitting or equipment, there is the stamp of utility. Everything is moulded, cast, and turned out by machinery: the locks, fastenings, gas and electric fittings manufactured for our buildings are perfect as contrivances for the end in view, but they are often inartistic. The stamp of commercial utility is on everything, even the decorative. The architect is powerless to do more than select the most suitable: he is unable to introduce his own views or any artistic reform. The expert in scientific construction or plan, has no inclination to study other sides of the problem. Thus we may instance a hospital pavilion, a working-class dwelling, or a technical school, or public baths;—the men who are at the head of their vocation in these matters have not the opportunity of cen-

sulting eminent art architects to assist them in giving expression to their plans—in fact, if he troubles at all about the design, he employs an artistic draftsman to carry out his views. It is impossible that one man can grasp the whole problem in its many-sidedness; but it is possible that the scientific expert may obtain the assistance of an artist who has some acquaintance with the particular class of building, and that their co-operation may be the means of producing a design more worthy of the object. Co-operation in design is one of the ways which we think it is possible to overcome the evil we have mentioned. The designs for buildings of a special class intended for labourers' dwellings, hospitals, schools, and the like, would be relieved of a good deal of their unsightliness, bareness, and want of artistic treatment if they passed through two instead of one set of eyes. We should not see so many crude buildings erected for these purposes, or for any utilitarian object, in which the only aim has been to satisfy certain requirements—to provide the bare dimensions and regulation patterns of Government blue-books and departments, without any attempt to make them agreeable to our sense of artistic propriety. The bare engineering structure is a case in point. The engineer scrupulously follows the depths and sectional areas of his beams and columns and roofs, but does nothing to make them pleasing or architectural. If he were associated with an architect who had mastered the actual wants of the building, had studied ironwork, the result would be different. Many of the little amenities of design would be observed, proportions readjusted to meet architectural rules. Internally, instead of a chaos of materials and fittings juxtaposed without any feeling or sympathy, such as mahogany partitions "scribed" to the contours of plaster cornices, and terracotta details; of iron columns abruptly terminating against an ornamental plaster ceiling, and all kinds of ill-assorted fittings, we should get more harmony and architectural fitness. One American writer on the subject of the design of the modern office building, discusses the qualifications necessary in the designer-in-chief of these buildings where there is so much of the engineering and technical. He says: "A type of mind unsuited for the position of designer-in-chief is that type which has no appreciation of art and beauty, and has no other measures than those of economy and efficiency." Such a mind "misses the best solution, or possibly never attains it, in a problem of this character, by the narrow view it takes of the things with which it is not familiar, and by reason of one-sided training is not fitted to be an intelligent and impartial judge of the various elements entering into a composite and complex design. The designer best qualified for this important position is evidently one who has a knowledge of the broad essentials and limitations of the various parts of the design, the judicial temperament permitting the balancing of an advantage against a disadvantage; a breadth of mind enabling a comprehensive view to be taken, coupled with courage and decision, with all these qualifications governed by a broad and catholic love of beauty in all its manifestations—not only of beauty of form and line, which is evident and can be comprehended, but of the more subtle beauty of science and its results." Such a combination of qualifications is seldom realised, except in a few rare instances, as in the engineer or architect whose knowledge of facts and laws is accompanied with a broad knowledge of the fundamental requirements of art. The same writer, in analysing these engineering-architectural problems, says that a building of this kind is seen to admit of two main divisions—(1) the engineering design; (2) the architectural design. The first comprises all the structural and mechanical components,

which include the foundation and superstructure, the stability against vibration and wind, resistance to fire and corrosion, also the planning of the floor areas and their subdivisions, supports, the position of lifts or elevators, lighting and heating systems, fireproofing and rust-proofing. The second division is made to include the treatment of the façade arrangement of the windows and internal treatment of the offices. The architectural part of the work, he goes on to say, admits of a number of ways of solving the problem. Without materially affecting the structural or engineering design—that is to say, if there is only one structural solution—there are numerous architectural treatments possible, and therefore the chief aim should be to fix upon the engineering structural solution first, and make the architecture conform to it. It is to find the right architectural treatment that is necessary. This argument may be open to question with those who believe there is only one possible architectural treatment for every building, and who deny that architectural design is something elastic, and can be fitted to suit any building. But if we make structural arrangement the basis of architecture, there can be only one treatment that is conformable to it. Directly we consider the engineering structure distinct from the architectural, it does not matter in what way we design the building. According to the twofold division we have given, the American author adopts the latter theory. It is not the most satisfactory, but it practically illustrates these remarks. An architectural problem attacked on the engineering or utilitarian side, as we have imagined, does not give much hope of a satisfactory solution. The artistic side goes begging, or is neglected altogether. In short, the solution is only a partial and incomplete one; and it is so seldom that one man, an expert, combines both his own and the artistic sides of his vocation, and if he obtains assistance, it is generally from one who has no sympathy for the particular object of the building. We think the latter is the most usual. Architectural specialists do not as a rule co-operate together. They are more likely to consult with men who know little or nothing of their particular business. The result is there is a want of sympathy between the plan and external design, between the motive of the designer and the practical details. Harmony is out of the question. In our large commercial buildings, warehouses, our residential blocks of flats, the monster hotels in the Strand and the West-End of London, we find this lack of harmony between the design of the architect and the crafts of the engineer, the furniture manufacturer, plasterer, the keramist, and the metal-worker. It would be needless to mention all the kinds of incoherence and conflicts we see; the disagreement between the architect's scheme of design and those of the decorator, ceramic artist, wood-carver, and upholsterer. The style, mouldings, and details of the architecture are nowhere in complete agreement with those of the woodwork, the ceramic wall decoration, or the gas and electric-light fittings. One thing seems to jar on the other; there is a want of completeness and finish everywhere; between the joinery and plasterwork; the mouldings do not properly unite, or are quite different in section. The connections of ironwork, the girder connections with the columns or stanchions, or the junction of iron and stone or brickwork are often grossly defective. Between the architect and carver or sculptor there is often a want of correspondence or harmony; their methods are not the same—each has been inspired by a different motive, and there is a want of affinity seen between the decoration and the design. Very often the artistic crafts have discerned the motive of the design, while the general designer has been ruled so entirely by his own object that no amount of

correspondence is possible between them; they are working on totally different lines, and appear not to see what is really wanted. Each has a great deal to learn from the other; but this is scarcely likely to be brought about by the present attitude of the crafts. The architect must cultivate a knowledge of other professions and trades; he should see the danger of not learning something from scientific requirements, from medical, sanitary, and artistic sides of the problem, so that it may not be worked independently from the outside to his detriment. So often a new movement is set up, and every new movement is a proof that something more is required than mere conventional usage, and if it is not recognised in time and accepted with a good grace, a profession springs up and appropriates the new idea or system to the disadvantage of the older profession. So it is that the present utilitarian or structural view of architecture is really a reaction from the meaningless reproduction of Classic and Gothic of the last century; but its value may be overestimated, and it is necessary to recall other views or elements that are equally important for a healthy architecture. The structural and utilitarian basis of architectural design is one that may become heartless and intolerant if not restrained by these considerations.

REGISTRATION.

THE resolution passed at a special general meeting of the Leeds and Yorkshire Architectural Society, in response to an invitation from the Royal Institute of British Architects that the allied societies should express their opinion on the registration of qualified architects, is noteworthy, a remarkable proof of the architectural mind on the subject, and a complete answer to those in the profession who would prefer to close the doors on all practitioners who are not members of the Institute. We gave the resolution last week, which ran as follows: "Resolved that, in answer to the request of the President of the Royal Institute of British Architects, this meeting of members of the Leeds and Yorkshire Architectural Society, allied with the Royal Institute, expresses itself in favour of the 'statutory registration of qualified architects,' and expresses the hope that the Royal Institute will take early measures to give effect to a principle which would give our profession a recognised status, and raise the standard of architectural education and training throughout the kingdom." Here in a few words we have the outcome of all we have been fighting for for the last twenty-five years or more. The profession, both here and abroad, have, with few exceptions, agreed to the principle of registration as the only plan that will protect the public from unqualified practitioners and the profession from the admission within their ranks of incompetent men, who now overwhelm the craft. The arguments against the registration of architects have chiefly proceeded from those who have attained lucrative practices, and who are not anxious to see the present condition of things altered, and also from those who pose as the leading art representatives of the profession, and who have won the distinctive titles of a Royal Academician or an A.R.A., and who think the highest positions in architecture will be imperilled by registering everyone who is competent irrespective of his artistic abilities, that art would suffer by being made an obligatory subject. Their opposition to the movement is chiefly from an art point of view. They imagine that any system of registration for architects would be to rob the profession of its artistic prestige, and they deny that any examination can confer any high art qualification—the latter view, indeed, very few persons would care to contradict. But the inconsistency of this attitude towards

the question we have pointed out. One or two well-known architects who oppose the movement are Royal Academicians; but, as pointed out by Mr. Seth-Smith in his able and conclusive letter, that very select body of artists "imposes an examination to ascertain if a man is artist enough to profit by its course of instruction in its school of art, and it actually registers by the distinguishing title of A.R.A. or R.A. those who do so profess." Nor do we hear of academicians suffering from these examinations. Again, the same writer shows that the Royal College of Art, which trains professional teachers for the art schools, imposes entrance tests and examinations. And the same argument applies in other cases. The universities of Germany and America have organised architectural courses, and degrees are provided. We will not at any length discuss this question again from the two points of view we have named. Those who have won positions in the profession by individual exertion and ability, and who desire to keep the doors as close as possible, should be the last men to raise any objection to the scheme, and it savours a little of narrowness to try to exclude those who on the essentials of their art have proved their ability. It is too much like ascending the ladder of fame, and having reached the topmost "rung," kicking it over that no one else should have a chance. On the second plea, that it is impossible to examine in art, more might possibly be said. We do not deny that it is impossible to make an artist by examination—that is, to implant in any candidate the art instinct and power; but one can surely test his powers as a designer. A prescribed course of art instruction sufficient as a minimum is surely not to be ignored; it cannot do any possible harm to those who have the natural gift. But for the Institute which has for many years adopted and applied the principle—viz., "that it is possible by an art, as well as by a science test, to ascertain a man's aptitude to follow architecture," to denounce a course of instruction or a test of proficiency in art is amazing. Nor does anyone dispute the fact that registration will not prevent disqualified persons designing the erection of buildings. The average citizen is free to engage an unqualified practitioner if he likes, just as he can select a quack in medicine to prescribe for him. In fact, the public are often perverse on these matters; there are many people who object on a kind of principle to follow any orthodox creed, or to employ a regular medical practitioner. They prefer to take quack medicines, any patent medicine which has been puffed up or recommended by a friend, without considering the mischief it entails on their health, and that what may do for one is not safe for another. And it is precisely the same in architectural matters. There are many credulous people who believe that a design drawn by a builder or his clerk will do just as well, if not better, than a design prepared by a qualified architect. The Medical Act has not suppressed quacks, and we do not expect that a Registration Act for architects will keep out incompetent men; but the Act will at least distinguish or "hall mark" the qualified, and put the public on their guard. Of one thing we may be certain: every succeeding generation will discover the advantages of the measure, and the standard required will be raised. And the public will soon begin to discern the advantages of securing the services of men who have a proper training rather than those against whom they would have no chance of redress for negligence or incompetence. Others, again, have urged that it would be a wiser and more practical step to secure the registration of builders as the only protection against bad building; but, as Mr. Seth-Smith has pointed out, "it would be like registering chemists and leaving the medical profession full of

charlatans." Little would the "registered" builder care if the design was full of defects of plan and construction, so long as he carried out the architect's plan in a workmanlike manner. The builder would not care to interfere with the architect's design, though the chemist would hesitate to risk his business. It is asserted that sanitary construction and scientific building are matters that are so well provided for by sanitary and district surveyors, as the officials of municipal authority, that therefore it is unnecessary that the profession should be qualified on these matters; but such supervision would be no guarantee to the owner that the regulations were carried out in a perfect manner without personal inspection. The support given to the Bill before Parliament, instituted by the Society of Architects, has been largely supported by the profession in all the influential Colonies and on the Continent, where similar legislation is provided. And amongst our leading members of the profession there has been a reconsideration of the scheme. Many of those who strongly opposed registration are now enlisted in its favour, and in the Institute itself, the stronghold of opposition to the Bill, there are signs of an awakening. The greatest proof is that many of those who failed to secure seats on the Institute Council were strong opponents of the measure, as we lately showed in the results of the election of the new Council, while Mr. Seth-Smith and many others, who have fought the battle gallantly, have been re-elected. These facts indicate at least that there is a change of opinion and feeling with regard to the measure. A higher standard of education and training is demanded, and it is now seen that such a standard will not be reached if the examinations are optional. To raise the standard of efficiency can be done only by a compulsory measure, such as that proposed by the Bill, in which a minimum of qualification will be required of all those who practise the profession. For a long time the question of a voluntary or a compulsory training has been discussed; even now there are some who think such a profession as that of the architect ought to be left to the student himself; but the general impression is certainly that nothing practical will be accomplished unless every architect who practises is called upon to show his capabilities in the elements of his profession, and this can only be done by statutory registration of some sort. As to its being made to include art culture there are still differences; but, as we have shown, they are gradually disappearing before the sounder views that now prevail. The Royal Institute is the right body to carry out the measure, if it can get rid of those traditional prejudices which have hampered it so long. As new and younger blood is being introduced, we may look hopefully to the change of front which is now apparent. The resolution passed the other day by the affiliated architectural societies in Yorkshire is a reflex of the opinion of all qualified provincial practitioners, who now regard the chaotic condition of the profession as prejudicial to the employment of architects by the public. Registration of competent men would be a great protection to both, and the furtherance of the interests of good building.

NATIONAL COMPETITION DESIGNS AND DRAWINGS.

THE annual exhibition of designs and works of the various schools of art, evening classes, and day classes has now become a very important record of the progress made in art during the year. From the numerous schools of art, branch schools, science and art evening schools no fewer than 5,722 works were entered for competition. The gold medals number only four, and are taken by students from Battersea

Polytechnic, Birmingham, New Cross, and Taunton. We are sorry to find that this medal is not awarded for any design of an architectural or decorative character. The recipients are three lady students, who send designs for printed muslin, lace, and silver brooches and clasps, and one male student, for model of a figure from the nude. Out of the 69 silver medals only one has been awarded for any design of an architectural subject. The examiners of the designs and architectural drawing, J. Belcher, A.R.A., Reginald Blomfield, and T. G. Jackson, say they are much disappointed with the showy work in this class of study (design), and have rejected a number of rudimentary and incomplete designs which should never have been submitted for the competition, and they regret that in many cases the mistakes made by the students show a want of intelligent instruction on the subject. The above remarks are not very encouraging to the profession. As the designs are not all exhibited it is impossible for us to "go behind" the opinion of the judges appointed; but we are afraid there is some truth in the opinion expressed—that this subject has not received the attention and study from those who instruct which its importance demands. We have before now drawn attention to the selection of subjects—some ambitious or simply so academical that they have no practical value for the student, others serving to display draughtsmanship rather than principles of design. One award of a silver medal is made to a student of the Regent-street Polytechnic for a set of drawings of the Hall, Eltham Palace.

Beginning our notice with the architectural designs, we find the examiners have awarded a silver medal for a design for an oak reredos and baldachino, by John H. Gibbons, of Manchester (Cavendish-street School). There is no question about the merits of this design, and the examiners say if the design had been accompanied by working details it is probable that a gold medal would have been awarded. We believe the merits of the design and its evidence of skill in the details given fully entitled it to this distinction. The plan shows an apse for the high altar raised seven steps above the choir, with rather flat canted sides, and the roof pointed in shape, groined in wood and panelled and gilded. The design for the reredos is feelingly drawn, and is of a Late or florid or Flamboyant Gothic character, freely treated, and slightly tinted. The centre compartment over the altar is the Crucifixion, with the kneeling figures; and this portion is carried up and ends in a rich, level, pierced parapet, and flanked by turrets. The details are masterly, and show a thorough knowledge of good models. Certainly the design by Frank Jones, of Scarborough, for a town mission church and hostel for a religious order comes next in merit, and deserves a bronze medal, though only a book prize is given it. The vaulting is certainly not very clear; but this is a detail which can be got over. The church and its adjoining mission house are in red brick, simply and broadly treated with much picturesqueness, on sloping ground. The roofs of slate make an agreeable colour contrast, and the massive tower of red brick, which breaks the composition nicely, is terminated by an open brick lantern supporting a central brick shaft or spirelet by open buttresses at the angles. The plan shows knowledge of the requirements. A bronze medal is given also to Harry A. Dickman, Nottingham, for a design for a town church in a Classic style, with lofty tower or campanile crowned by a cupola over the west entrance. The plan has a centre vestibule, with vestry and baptistery at the west, and a nave and two aisles divided by coupled piers and pilasters of the Ionic order; a choir and clergy vestry at the north side of choir, a morning chapel on the south side, and an apse with semi-dome over. A circular ribbed

and panelled vault covers the nave, which is partly lighted by clerestory windows hidden behind a parapet carried up above the aisle roofs. The drawings are firm and show good detail, and a solid rusticated treatment externally is given. This is certainly one of the best designs hung. A design for a country house is a popular subject. Athelstan Iredale, Gloucester, shows local stone for the walling, with a yellow stone in dressings of windows, &c., and rough-cast above. The style is plain, sensibly treated, with mullioned windows and red tile roof; but no plan is seen. Another design, by S. F. Parsons, Nottingham, adopts an Elizabethan style. The plan is fairly good, with projecting kitchen office wing on the north-east side, and there is a symmetrical main front on the west side of house, with bay windows to the drawing and dining rooms at each end. An open loggia forms a feature between. A book prize is awarded to each of these. We prefer the student to take a simpler style than the last; the choice of expensive styles should be discouraged for this class of work. A design for a village club and entertainment hall, a good subject, secures the same prize. Herbert Rainger, Gloucester, adopts local stone for walls, with rough-cast above and red tile roofs, with half-timber constructionally used on the gables, &c. Without the plan we cannot judge of the merits of the design. A design for a provincial bank in a rather heavy style is sent by a Leicester student, Harry W. Meech, receives a book prize. The design for town-hall, by G. H. T. Robinson, Wolverhampton, is a theme too pretentious in kind for the student whose architectural knowledge is not quite equal to the effort. The entablature is faulty in proportion of frieze, and the plan, with open court in centre, is quadrangular and defective in arrangement. The corner cupolas are also meagre, and the tower over centre vestibule is weak in detail. The design for museum and art gallery, by A. Halstead, Burnley, is also a subject far beyond the capacities of the art student. A good general idea is spoilt by the architectural details, in particular by the coupled pilasters carried on pedestals, which rise between the lower windows and have a weak appearance. The plan is symmetrical, with two large museums as wings, and a larger central hall and staircase than necessary. The design for chancel screens by Charles Green, a Birmingham student, receives a bronze medal. They show a knowledge of framing, yet the designs hardly merits the prize if we compare relative merit. The cross carried on a carved corbel over the entrance on No. 2 is weak. Decorated pierced tracery is shown in the other design in oak.

The architectural drawings from measurements are few, and the selection is less satisfactory, though the examiners say the general average of work compares well with that of last year. A silver medal is awarded to Percy Ion Elton, of Regent-street (evening school), for his fine set of drawings of "The Hall, Eltham." They are in ink, and remarkable for the neatness and care of execution. This set was awarded a first silver medal at the R.A. competition of 1902. The example is a good one, and the noble timber roof has become an historic example worthy of all architectural students' efforts. Harold S. Sawyer, Winchester, obtains a bronze medal for his measured drawings of the Castle Hall in that city—noted for the King Arthur's round table. The building was originally Norman, but is now mainly Early English. The same prize is awarded to Bryant Alfred Poulter, Reading, for his exquisitely drawn plans and elevations of "The Forbury," Reading, a fine example of an old brick residence of the 18th century, with its two bay windows and flat-gauged arches, now used for offices by Messrs. Ravenscroft, Son, and Morris, architects, and Messrs. May, solicitors. There is a large

sheet of details of mouldings and the fine old staircase. The colouring of the elevations is of the proper depth of tone, but looks rather heavy in a drawing. The remark of the judges on the use of broken lines in drawings of this kind may be useful: they are too often substituted for the fine line with less accuracy. A bronze medal is also given to Annabelle Runciman, Aberdeen, for measured drawings of a carved oak screen in King's College Chapel in that city. The drawing is in fine pencil lines with details. A book prize is given to John D. Forbes, Inverness, for his large measured drawings of the steeple of church in that city—a Classic steeple; to Christina Corbett, Carlisle, for drawing of a screen between chancel and north aisles in the Cathedral; to William E. Sands, Nottingham, for his pencil drawings of chancel screen in All Saints' Church, Strelley; also to Sidney R. Day, Leeds, for measured drawings of oak screen in St. John's Church, dated 1633, Elizabethan in its features, and another book prize to F. Goldsborough, Birmingham, for drawings of porch to Berkswell Church—a fine pencil drawing. In some of these drawings there is a desire to emphasise detail with thick lines, a device that cannot be commended for drawings of this kind, and the remark of the examiners about the mistake of outlining ornaments with thick lines is justified.

Internal decorative designs are an interesting feature of these exhibitions; this year the work is fairly good. A silver medal goes to a Chelsea student, Bertram Payne, for a design for a hall in the style of Francis I. There is evidence of study of the period—a stone corbelled chimney-piece, screen and door of wood. The design for coffered ceiling and the cabinet are well drawn. Arthur MacKinder, of Lincoln, has a design for the decoration of an ante-chamber to the state apartments of an Egyptian Governor, a very delicate treatment in tints of white and gold. The doorway and panelling, drawn to 2in. scale, exhibit knowledge of detail; the woodwork is painted white, the parts in relief to be glazed; the frieze and wall filling to be stencilled on linen. The ceiling and stencilled frieze are cleverly executed, and the design is well worthy of the silver medal awarded to it. Louise R. Jacobs, Hull, receives the same medal for her design for a nursery overmantel—a very able design, exhibiting simplicity of conception and grace of fancy and nice sentiment in the charming little maids dancing under trees, with lamps held up by old men on the branches. The blue and green tints are nicely harmonised. A design for a stencilled frieze and wall filling, by David Hodge, is clever, and takes a silver medal. The designs are in white or grey and zinc, a silvery metallic lustre on the brown ground. The same award is made for a plaque, in which graceful lines of figures and swans are represented, with a border of swans sgraffito. Also for a vase executed in sgraffito and coloured "slips." Margaret Annie Smith, Stoke-on-Trent, receives this medal for a very beautiful design for plaque, with sgraffito ornament, displaying much invention and charm in the whirling lines of figures round the centre and border. Chas. Connor, Hanley, takes also the prize for his designs for pottery panels for wardrobe and music cabinet. The woodwork is exceedingly simple and well treated, with well-drawn figures. The music cabinet, in framed oak, with pottery panels, on sgraffito, is clever. Herbert Budd, Hanley, is a recipient of the prize for designs for pottery panels for a fireplace. The work is simple and broadly treated, the sketches for panels in coloured "slips" with sgraffito outline under glaze, the whole dipped in a toned glaze and fixed in the woodwork exhibit skill and imagination. On the same wall we notice a clever design for a sundial in pottery in majolica glaze, by Joseph Finney, of the same school, and an executed example. A corbel

executed in coloured majolica glaze, by G. Brain, Hanley, receives a bronze medal. The design for dado tiles, by J. Skinner, Burslem, shows skilful arrangement, and we must notice also a design for a mosaic pavement and frieze by Thos. Cook, West Ham, exceeding able in the motive. The peacocks introduced in the design and border of pavement are nicely arranged, and the frieze in Venetian glass mosaic with figures of maidens introduced in a sort of Vitruvian scroll, is pretty in device. The designs in stencil are often too intricate for this process, which should be to repeat a simple pattern. Many of the stencilled designs are a violation of this principle. The designs for stained glass show an advance in adaptation and arrangement. Ida L. Kay, Birmingham, sends designs for windows in which the composition is decidedly clever. The silver medal goes also to James S. Alderson, of the same place, for very clever glass panels, one with three graceful figures introduced, simple in conception; also to Joseph Sanders, of Birmingham, for glass with a design, "Beauty and the Beast." Florence Camm, also of the same school, exhibits design representing St. Nicholas and the restoration to life of three children. Several other designs for furniture, decoration, metal-work, stained glass, and those for modelling deserve notice. To these and other subjects we may refer next week.

"BUILDING NEWS" DESIGNING CLUB.

A WAYSIDE TAVERN AND TWO COTTAGES.

THIS is an eminently favourable subject for the display of capabilities in the direction of the picturesque which naturally embodies the ideal of the young architect whose enthusiasm, when associated with an artistic temperament, may possibly run riot at times, and result in extravagances. The more prosaic student, hampered by a consideration of the practical and evident limitations of everyday affairs, is apt to smile at such exuberances with which he has but little sympathy, though, after all, there is by far too little poetry in life, and without enthusiasm no living art is possible. In setting this competition we had in view the realisation of such an ambition among the members of our Club, and we are keenly sensible of the priceless value of a well-directed enthusiastic sense as an essential factor in all matters connected with successful design. The imagination must be cultivated and afforded an incentive to action, though it is also manifestly true that the possessor of real genius, more or less in degree, will sooner or later impress his gift upon what he does, and will not fail to create his opportunity. The Building News Designing Club encourages the trial of conclusions with others in open competition, as a healthy rivalry for mutual improvement amongst men living far apart in all quarters of the country away from the Metropolis more than likely, and for this reason and in other ways precluded from joining architectural classes. We generally endeavour to make a choice of subjects which are calculated to assist the student in the practical solution of contemporary problems likely to come within the scope of ordinary practice, and in which the chances for the exhibition of picturesque freedom are correspondingly restricted. The design, therefore, of a country public-house, with a post-office and cottage situate at the corner of some rural goosgreen, was advisedly chosen in the hope of bringing out more particularly those artistic qualities which should insure a suitable and pretty result. This intention needs only one qualifying remark, which is this: that there is no more deplorable exhibition to be noted in a study of architectural design than the painful failure which is inevitable when a designer consciously sets to work to produce a picturesque composition without recognising as a leading principle that such a result can only be obtained as a natural sequence upon the practical conditions for which his structure is evolved. Of course, it goes without saying that the picturesque is a matter quite apart from petty details and the frills of foolish ornament. It is also an essential of the picturesque that it should be unconstrained, and sweet in line as well as in

proportion. How, then, have our competitors risen to this ideal? The answer can be obtained by a reference to their designs, and here, as in all questions of taste, our readers will form their own judgment. We place "All British" first, "Solo" second, and "Whone" third. We give the conditions issued for the use of competitors:—

A Country-side Tavern and Two Cottages, one being the post-office. This group of picturesque little buildings will occupy a corner site, overlooking a goose-green and facing south, the land being flat. The "pub" is to be at the corner, with a draw-up place for carts with horse-trough, and sign on a post standard. The accommodation of the tavern to be a bar and bar-parlour, with a smoking-room on the other side of the passage, which is to lead through to the yard in rear. This house, like the other two, is to be on two floors, with a kitchen-living room and a small sitting-room and four bedrooms and offices. The third house, which will be the post-office, is to have a shopfront for that business. The two cottages to have front forecourt gardens, 15ft. deep, with white painted wood palings. Walls roughcast on a brick base 7ft. high, particularly where the walls will be subject to rough usage by wear and tear. Roofs covered with thatch. Windows to be double-hung sashes, save to little offices, where casements will do. The staircases must be economical, but prettily contrived and well lighted. Ground-floor rooms 9ft. high, upper rooms 8ft. 6in. The width of the whole frontage is 100ft., and no limit of depth. The living rooms to be 14ft. by 12ft., square kitchens 12ft. by 12ft., or thereabouts. The tavern to be of similar proportions, the bar parlour being 20ft. by 14ft., the greater size to be out of the depth of the site. Scale 8ft. to the inch; sufficient drawings, including a small sketch view.

"All British" has somewhat cleverly imitated old vernacular cottage building, and avoided the modernised methods of roughcasted, thin, and cheap picturesque building which for a few years has been in vogue, with sloping buttresses, red chimney pots and blinds, set off by green-painted woodwork. The broad unbroken eaves line of the thatched roof, and the big, plain chimney stack, give dignity which comes of simplicity. We are not quite sure that the weatherboarded gable is an advantage. Plenty of precedents could be found no doubt, though sometimes the boarding has been added in aftertimes to exclude driving rains on the gable walling becoming faulty. The plans are fairly good, though open to criticism in parts, such as the corridor on first floor of the tavern where it would be none too light. "Solo," the second man, lacks the breadth which the first design illustrates. The return front of the tavern would look very well; but the idea of the bar arrangement is more in accord with the everyday public-house type with its glazed bars, and we much prefer the more unambitious open counter arranged by "All British," which is more in harmony with country-side needs and hospitality. The post office is less cramped, and the cottage belonging to it has a separate front entrance, whereas in the first-placed plan the only other entrance is through the kitchen, unless the post-office door is used for the house, which would hardly do.

"Whone," the third design, differs in the main entirely with the other two. It is a much more involved affair seemingly at first sight, on account of the peculiar mannerism of the draughtsman, and by reason of the tavern part being carried back just as it is. "Whone" does himself an injustice by such drawing, and he is too pretentious in minor matters. It would be so much simpler and better if he would be less affected in his style, while his plans (which are not devoid of ability and inventiveness) would be clearer and more easily read if they were drawn properly. References to haunted guest-chambers are in their way very well; but, after all, we have to deal with building work and materials as well as plan for everyday uses. The barnmaid's place and the bar standing-room are quite inadequate and cramped, close as they are up to the front entrance. The service to the bar-parlour seems to depend entirely on the kitchen, seeing that the passage-way comes between the bar and the parlour.

"Four Point Seven" ranks fourth with a design which lacks simplicity, the front of the tavern being its best part, though the plan is disconnected and poor. With such a record it may be wondered why we place him thus in the competition. We do so on account of his general merit and style of drawing, also for the way in

which he has arranged his subject on the sheet. He must not take too much credit, however, for this, as in our judgment he ought to have done better. For one thing, his staircase would not give head room below for the space he has shown available on the ground floor. Domestic architecture of this elementary kind is spoiled by too pronounced vertical lines. "The Last Man In" has made a bold stroke at originality by disposing his tavern on plan with a crescent-shaped curve to form a "court yard," as he terms it, in front of the archway leading to the yard at the rear. It is not, however, a success. The effort is too manifest, and by dividing the arrangements in this way we get a much more ambitious type of inn than what was contemplated. Externally we note no little ability displayed; but thatched roofs do not accommodate themselves to parapets structurally, and artistically the combination is not pleasing, because it looks wrong. "Brassey" puts projecting angle-set bays to his tavern, which, under some circumstances, looks very effective with gables running diagonally into a main high-pitched roof. His plan is very poor, with a central octagon by way of a hall crowded up with a staircase. His cottages are good in planning, though no extra room is provided for the post office, so that this house is one room less than the other. "Vectis" has the same objection, and by separating the cottages from the tavern also takes away one of the leading advantages open to the competitors to get an effective group. The roughcast gabled first-floor sits in an ungainly fashion on to the arched central door of the tavern, and the roofs are too sharp in their pitch to look restful and pretty. "James," too, cuts up his design too freely, and fails to realise the homely merit of repose. Possibly in execution his scheme might look better. The drawing is crisply handled, but impresses one with an overdone appearance. "The Kid" is ambitious and ingenious, setting out his public-house on an inverted V-shape, the bar being in the midst, with smoking-room and bar-parlour right and left. It is a clever plan, but uncomfortably quaint, and so dark in its rooms. The smoke-room has a minstrels' gallery, which would not be very conducive to good music under such conditions, and, besides, the whole thing is too small for such contrivances. The style is half-timbered and odd. "Viking" adopts, too, this same style of work; but he introduces a tower with a domical top in thatch. His post-office is a shop wedged in between the two cottages somewhat effectively, though it has the appearance of having been cut into the façade subsequently to the erection of the house. "Icicle" is, for him, a long way down in this list. His design has a thin look, and his pub is wasteful in passageways. "Pan" sends a well-executed pen-and-ink view deserving of praise; but we cannot admire his design, which has a pinched look on plan in the tavern, principally due to the narrow passage and poor entry. The bar-parlour is better, but the house does not adapt itself nicely to a corner site. "Muggins" is a long way behind the last named. "Tenderfoot" should not colour his elevations, and is referred to the rules. He is a new competitor who ought to come to the front. At present his plans are very weak. He should study stairways. "Lactrea" is neat: he sends a square sort of public-house, which is quiet and suburban-looking, but not suitable for a country goose-green. "Inside Right" comes next with a plain and simple proposal, which is drawn thinly. "Hurry" also is thin in his draughtsmanship and toy-like in his design. "Spes" and "Ogee" conclude the series.

ON BUILDING TIMBERS.—XXXII.

HARDWOODS, FANCY WOODS.

THOUGH, with the exception of oak, mahogany, and teak, these woods do not enter largely into building work, yet as they are frequently placed on the market here with soft woods, and are occasionally used in decorative work, a short account of each is given, as there is a tendency to use ornamental hard woods in some of the best modern buildings where the nature of such are at all well known. There are a few rules which may be laid down for the guidance of those who intend to employ woods with which they are not familiar in joinery. All framing should be of straight-grained wood, free from knots; the wood should also be straight

grown—that is, free from twist in the log. In many logs the slight cracks due to drying (which are seen on the sides of most hardwoods) may run in lines parallel to the corners of the log from end to end; but in some this "checking," as it is called, may be seen to run obliquely across the faces of the log. The tree from which such a log has been cut was twisted by prevailing winds in growing, and it should be rejected for framing of any kind. Figured or wavy wood should never be used for framing. When it is handsome enough, it should invariably be cut into veneer, and used for panels only. All veneered panels, whether seen on both sides or not, should be veneered on both sides, or the veneer will pull the panels round on the face. The best wood for veneering on is mahogany. Honduras will do, but it must be straight-grained. Wavy wood will not stand if it is worked solid in door panels, and this holds good for piano cases, and other articles of furniture.

ASH: *Fraxinus Americana*, syn. *F. Alba*, *F. Canadensis*, *F. Acuminata*, *F. discolor*, *F. Eupatoria*, and *F. Lancea*. Popular names—White Ash, American Ash, and Cane Ash. Found from Nova Scotia and Newfoundland South to Florida, West to Ontario and Minnesota, Nebraska, Kansas, Indian Territory, and Texas. Grows there in swampy wet lands, but requires good soil, as it does in this country; all attempts to grow ash here in poor soil will result in failure. Land good enough for Ash is good enough for crops. There is another ash grown in America, *Fraxinus Nigra*, syn. *F. Sambucifolia*, it is popularly known as Swamp Ash, Water Ash, Brown Ash, and Basket Ash. The White Ash is a tree from 60ft. to 100ft. high, and from 3ft. to nearly 6ft. in diameter, the largest specimens being found in the Ohio River basin. The Brown Ash seldom attains a greater height than 80ft., with a diameter of about 2ft. There is no figure in Ash, and the annual rings are marked by large open ducts, which are prominent in any tangential section of the wood. Certain excrescences on the trunks of Ash-trees are called "burrs" or "knots." They show a highly ornamental figure when cut radially, tangentially, or transversely: hence they are in great demand for veneer. A burr cut tangentially gives a grain something like bird's-eye maple, the eyes being much smaller in the Ash. Ordinary Ash is light brown, coarse-grained, hard, and strong. A cubic foot weighs about 40lb. Quebec Ash is sold in London at about 60s. per load when squared, but the price for first-class stuff may rise to as much as 80s., the logs being from 13in. to 20in. square, and from 14ft. to 21ft. long. Galveston round logs are worth from 1s. 1d. to 1s. 4d. per cubic foot. What is known in the trade as "American Ash" is sold by the superficial foot when cut into boards 1in. thick and under, and by the cubic foot when cut into boards thicker than 1in.; 3in. and 1in. boards are worth 13d., and boards from 1½in. to 1½in. vary in price from 1s. 6d. to 2s. 3d. per cubic foot. Hungarian Ash sells for about 1s. 4d. per cubic foot. **BASSWOOD:** *Tilia Americana*, syn. *T. Nigra*, *T. Glabra*, *T. Latifolia*, *T. Canadensis*, *T. Neglecta*. Popular names, Lime tree, Linden or Lin and Bee tree. Found in the North-East United States, less abundantly in Canada, westward to Nebraska and Kansas, and southward along the Alleghenies to the Gulf States. Basswood is light brown, with sapwood of the same colour, so that one is not easily distinguished from the other; it is soft, close-grained, and easily worked. It is very light, weighing not more than 28lb. to the cubic foot. The tree is usually about 80ft. high and 4ft. in diameter when fully grown (the inner bark is known as bast), and when in flower it yields honey in abundance. Hence its name, "Bee tree." Boards can be obtained from basswood up to 100ft. wide! This is done by cutting it continuously all round the log in a lathe specially made for this work. The builder should note that, unlike whitewood, basswood is liable to crack in seasoning. A tangential section of basswood gives a grain—something like maple, without the "bird's-eye"; radially the straight grain of the annual rings is faintly marked by horizontal bands of medullary rays. Basswood is worth here about 1½d. per foot super. 1in. thick. **BEECH:** *Fagus Ferruginea*, syn. *F. Americana*, *F. Sylvestris*, *F. Alba*, *F. Sylatica*. Grows in Canada and the north-east United States, west as far as Wisconsin, and south among the Alleghenies to Georgia, and attains its greatest dimensions in Wisconsin, Michigan, and the forests round the Great Lakes,

where trees 100ft. and over, with a diameter of 4ft. may be found. Beech is a hard, tough, close-grained wood, of a reddish-brown colour, the sapwood being white. The medullary rays are more marked on a cross-section of this wood than on any other section, though they show well as a "silver grain" on a radial section. The wood is heavy, weighing 43lb. to the cubic foot. Carpenters and joiners are familiar with it in their plane stocks; it is also much used for chair-making. It is a wood much subject to the attacks of worms. **BIRCH:** *Betula Alba*, syn. *B. Papyrifera*, and *B. Nigra*. There are several species, all without figure or ornamental grain of any kind, whether cut radially or tangentially. First-class birch planks are imported from Quebec, Halifax, and St. John; logs also come from the same districts. Pieces 2in. to 3in. thick, and from 7in. to 19in. wide, with lengths varying from 10ft. to 16ft., sell here for about 1s. 4d. per cubic foot; smaller sizes are worth about 1s. When the lengths are shorter—say, from 4ft. to 10ft.—the price would not be more than 9d. per foot, the value of the wood depending on the lengths and widths, the quality remaining the same. Logs squaring from 18in. to 20in. are usually sold by the load; they are worth about 35s. Nearly all the put-logs now used in scaffolding are birch. They are imported ready-made from Sweden, and are sold at from 4s. 9d. to 5s. 9d. per dozen in lots of 50 and 100 dozens. **BLACKWOOD:** *Acacia Melanoxylon*, is a large tree found growing in Victoria, New South Wales, South Australia, and Tasmania. The colour of the wood is usually a dark brown, and the grain either straight or wavy. This acacia is said to be one of the most valuable timber trees found in the whole of Australia, as the wood is durable, easily worked, and a good substitute for American walnut. Tasmanian Blackwood is imported in logs. When about 26ft. long and from 22in. to 26in. square, they sell here for about 3s. 3d. per cubic foot. A fair-sized log would contain about 106c.ft., the smaller sizes not quite half so much, or about 45ft.; a ton weight would be about 34c.ft., and a log of usual size, up to say 27in. or 29in. square, would probably be worth up to 4s. 6d. per foot for furniture. Blackwood from the Cape of Good Hope is a yellowish wood striped brown. It takes a good polish, and is a good furniture wood. It is cut from a tree known to botanists as *Royena Lucida*. Indian Blackwood is known here as "rosewood." CEDAR is a popular name applied to the names of very different trees; it is apparently given to all timber which yields that peculiar odour, so well known to those who use cedar pencils when the latter are cut, or the wood is anyway bruised or broken. Pencil Cedar is the wood known to botanists as *Juniperus Virginiana*; it is therefore not cedar but juniper. It has several other names, based chiefly on the localities from which it is derived, as, for instance, *J. Bermudiana*, *J. Caroliniana*, *J. Barbadiensis*. It is also known as *J. Feticida*, and *J. Sabina*, a Rocky Mountain variety, is probably *J. Scopularium*—the popular names are Red Juniper, Red Cedar, and Savin. This juniper is the most widely distributed of all the American Conifers; it is found from Canada to Florida, and westward to the Rocky Mountains, though it is not known in some localities within these limits. When well grown the tree is usually from 80 to 90ft. high, with a diameter breast-high of 3ft. or a little over. The wood is soft and easily worked; it has absolutely no figure when cut, either radially or tangentially, and is valuable only for its colour, which is a dull red, fading to purple on exposure to light, and for its smell, which is considered so pleasant by some people that they panel rooms with it. In former times it was commonly used to make the sides and bottoms of drawers, for the smell kept moths away, and in old furniture it is frequently found making up the whole article except the front, which is probably a very dark "Spanish" mahogany. This "Cedar" is, of course, easily recognised by its colour, even grain, and smell; the sapwood is always nearly white. There is a room at Kelham Hall (built by Scott) lined with "pencil cedar." The wood is now seldom used in building here, but in America it is worked up for internal joiner's work, and on the railways it is used for sleepers. A cubic foot of pencil-cedar weighs 30lb.

The United States Cedars are generally classed as "white" or "red," according to the colour of the heartwood of the trees, white Cedars having a heartwood light greyish brown, and red Cedars heartwood of a deeper red colour, the sapwood in

both being nearly white. The white Cedars are *Libocedrus Decurrens*, *Thuja Occidentalis*, *Chamaecyparis Thyoides*, and *Chamaecyparis Lawsoniana*, and the red Cedars *Thuja Gigantea*, the Juniper already described, and *Sequoia Sempervirens*. *Libocedrus Decurrens* is a large tree found growing among pines and firs in Oregon and California; it is about from 100ft. to 150ft. high, with a diameter of from 4ft. to 8ft.; the wood is fine-grained, weighing about 28lb. to the cube foot, though it is liable to rot; roof shingles and furniture are made with it. Another name for this wood is Incense Cedar. *Thuja Occidentalis*, or Arbor Vitæ, of which 48 varieties are recognised in cultivation, is found from Maine to Minnesota and northward to Canada, growing along streams and lake shores. In some districts the tree covers extensive swamps. Where well grown a few trees may reach a height of 60ft. with a diameter of 4ft., but generally speaking they are seldom found large enough to cut into deals or other "timber"; hence the wood roughly dressed is used for posts, rails, and sleepers. A cubic foot of this Cedar scarcely turns the scale at 20lb. *Chamaecyparis Thyoides* is a medium-sized tree found along the coast from Maine to Mississippi. Good specimens are from 80ft. to 90ft. high, with a diameter of from 2ft. 10in. to 3ft. 10in. The wood is soft and easily worked. It is also light, weighing not more than 21lb. to the foot; furniture, interior joinery, and shingles are made with this timber in the States. *Chamaecyparis Lawsoniana*, popularly known as Port Oxford Cedar, Oregon Cedar, Lawson's Cypress, and Ginger Pine, is a very large tree found growing in the coast region from California to south-west Oregon, seldom extending more than 40 miles inland; no less than 70 varieties are at present in cultivation. Lawson's Cypress grows from 150ft. to 200ft. high, with a diameter of 6ft. breast high, and some trees have been found with a diameter of no less than 13ft.; the wood is extensively used for all kinds of building work, being heavier and stronger than any of the other American cedars; a cube foot weighs close on 30lb. *Thuja Gigantea* or *Plicata*, the red Cedar of the West, is a very large tree which attains its greatest dimensions in low grounds skirting watercourses, and in swamps. It is found in Southern Alaska, Washington, Oregon, North California, and East Montana, growing to a height of from 100ft. to 150ft., with a diameter of from 3ft. to 10ft. The wood is everywhere used for cabinet-making, joinery, and roof shingles. Other Cedars are West Indian, *Cedrela Odorata*; East Indian, *Cedrela Toona*; North African (Algeria), Atlas Cedar, *Cedrus Atlantica*; Palestine Cedar, *Cedrus Libani*; the Deodar of the Himalayas is *Cedrus Libani*, var. *Deodara*; Moulmein Cedar, *Cedrela Toona*, found in Bengal, Assam, and Burma; Cape Cedar, *Callitris Arborea*; and Tasmanian Cedar, *Athrotaxis Selaginoides*. From the foregoing description of the various woods popularly known as Cedar, it is obvious that the architect must not rest content with using that name only in his specifications, for it will define very little; he must make himself acquainted with the chief characteristic properties of the particular Cedar he wishes to employ, find out where it is grown, and if it is imported here, specify accordingly. West Indian Cedar, Tabasco, Honduras, and Cuba is worth from 4d. to 6d. per superficial feet lin. thick. Log ends are usually sold for about £8 per ton. This cedar is common in the London market. African cedar is worth about 3½d. per super. foot lin. thick. Coccoloba wood, *Brya Ebenus*, or green ebony is grown in Jamaica. It is used for inlaying, electric bells, pushes, small door-handles, &c., the tree not growing large enough to furnish wood for larger work. Cottonwood is a poplar. There are twelve species of this tree; but that known as *Populus Deltoidea* furnishes most of the cottonwood coming into the English market. The wood is whitish grey or pale yellow, with white sapwood. It is soft, easily worked, not durable, and when the grain is not straight it twists a good deal in seasoning. When cut radially the surface shows a straight figureless grain. Tangential sections show markings of the medullary rays; but it is not a handsome wood under any circumstances, though any face shows a satiny lustre after a sharp plane. This poplar is a large-sized tree (90ft. to 150ft. high, with a diameter of from 6ft. to 12ft.); it forms extensive forests in the Mississippi Valley, and in New England to the Rocky Mountains. In the States it is known as Necklace Poplar, Carolina

Poplar, and Big Cottonwood; botanically it is also known as *P. Angulata*, *P. Lævigata*, *P. Angulosa*, *P. Canadensis*, *P. Virginiana*, *P. Marylandica*, and *P. Lindleyana*. The tree is called "cottonwood" from the seeds, which are furnished with long "cotton" filaments, these being blown away in clouds by the wind. Cottonwood is usually put on the market here cut into boards 1½in. thick, and from 6in. to 24in. wide. These are sold by the cube foot, which is worth about 1s. 8d. Ebony: *Diospyros*, the order *Ebenaceæ*, contains two genera: *Maba* and *Diospyros*. The latter is a large one, and it includes all the different species of ebony; but that known as *Diospyros Ebenum* is the chief ebony-yielding tree. Ebony is the well-known jet-black, close-grained hard wood, of which the sapwood is grey striped with black. It is a very heavy wood, the heart weighing 74lb. to the square foot. Ebony grows in the forests of the Deccan and Carnatic, and also in Ceylon, where it is an important wood. Formerly the forests in the latter country were cut at the rate of 2,600 tons yearly—a consumption which threatened the total exhaustion of the ebony there; but the cut is now reduced to about 300 tons. Ebony is a slow-growing tree: it is not quite 6in. diameter at 25 years, 12in. at 75 years, 18in. at 135 years, and 2ft. at 300 years; the largest tree ever seen measured only about 27in. in diameter. It has been ascertained that the darker the colour of ebony, the more durable it is, and that the colouring matter is not in the cell walls, but in the cells themselves. Ebony is sold by weight here. Ceylon logs, average of 68, weigh about 4½cwt. Much smaller pieces come into the market from Madagascar; the wood is usually sold at £15 per ton. Ebony is used for inlaying, and balusters in staircase or other ornamental work. Elm: *Ulmus Americana* is a hard, strong, tough wood, cross-grained, not easily cleft or worked; it warps and splits in drying, so that it must be carefully handled. English elm was formerly much used in the outer sheathing of barns, where the board surfaces became almost as hard as iron under exposure. In the States and Canada elm is used for agricultural instruments, and latterly it is becoming fashionable in furniture; bastard cut, or tangential stuff, sometimes showing beautiful figure, is sometimes selected for this purpose; it takes a high polish. Elm is a heavy wood, it weighs over 40lb. to the cube foot. The heartwood is light brown, and the sapwood yellowish white. From Southern Newfoundland to Lake Superior, and the eastern base of the Rocky Mountains, and southward to Florida and Texas the Elm is found growing, the finest trees being those of the Temperate Zone, many of which are 100ft. high, and from 6ft. to 7ft. in diameter. The American Elm is known in the States as the "White Elm" and the "Water Elm." Botanists know it too as *Ulmus Alba*, *U. Mollifolia*, *U. Pendula*, and *U. Floridana*, all of which are synonyms for *U. Americana*. Another Elm is the Rock Elm, *Ulmus Rupestris*; it is also known as Cork Elm, Hickory Elm, Cliff Elm, Thomas Elm, and Wahoo. It is called Rock Elm from the curious projections found along its branches after they are three or four years old. The wood is hard, compact, tough, and very strong; the fibres are laced or contorted, so that it is not easily cleft; the heart is light brown, and the sapwood a dirty white. The width of the annual rings in the Rock Elm vary very considerably; the medullary rays are not distinct, and any figure in the wood is seen only on tangential sections; it weighs over 45lb. to the cube foot. Rock Elm may be distinguished from White Elm by the size of the open ducts, which are well marked in the boundaries of the annual rings in the latter; these are not nearly so distinct in the Rock Elm. First-class waney Elm logs sell here from 57s. 6d. to 65s. per load, the logs being from 12ft. to 26ft. long, and from 13in. to 26in. square. Quebec Elm, 50ft. long and 12in. square is worth more; it brings sometimes as much as £5 12s. per load, the great length increasing its value. Fir is a name very frequently applied to wood which is not fir. In England architects write of Memel "fir," Baltic "fir," "Scots "fir," and other "firs" which are not fir—they are pines. Spruce is sometimes called "fir," and so is larch. The wood is something like spruce, but fir may be distinguished from pine, larch, and spruce by the absence of resin-ducts.

The Firs are all known to botanists as *Abies*, the largest being *Abies Grandis*, which is found from Vancouver to Central California, and eastward to Montana; it attains its greatest develop-

ment in Western Washington and Oregon. Some of the trees are 300ft. high with a diameter 5ft. breast high. This is a white fir, and it furnishes much of the building timber where it is found; a cube foot weighs 22lb. *Abies Amabilis* is another white fir; it forms extensive forests in the mountains of Washington and Oregon, and attains its best development in British Columbia, where it grows to 150ft. with a diameter of over 4ft. *Abies Nobilis* is a red fir very often confounded with Douglas fir; with *Amabilis*, *Nobilis* forms extensive forests on the Cascade Mountain slopes, between 3,000ft. and 4,000ft. in Oregon. This tree is also common in Washington; a cube foot weighs about 28½lb. *Abies Magnifica* is another red Fir. It attains a height of over 250ft., with a diameter of 10ft. or more. This tree forms forests about the base of Mount Shasta, in California; it is also found along the Sierra Nevada Mountains, to the south of Shasta. The wood twists and warps in drying, which render it unfit for building, so that its chief use is for fuel. Another fir, *Abies balsamea*, which is found growing from Minnesota to Maine and northwards, is often cut with pine and spruce, and sold with them on being cut into deals and other scantlings. None of these firs come into the London market; they are not used for building in this country. Architects and surveyors should therefore cease to specify "fir" of any kind for their buildings, as there is no such timber in the trade at present. Timber merchants, shippers, brokers, and others talk of Dantzic "fir," Libau "fir," and Riga "fir," but there are no such timbers;—they mean pine in each case. Hickory (*Hicoria ovata*) is a tall, slender tree found in scattered clumps or small groves among other broad-leaved trees from Lake Ontario to Texas, and from Minnesota to Florida, but always best developed in the Ohio and Mississippi River basins. It has a variety of popular names, such as shell bark, shag bark, scaly bark, upland hickory, white walnut, and sweet walnut; the botanical names are quite as numerous. The wood is hard, strong, tough, coarse-grained, smooth, and usually straight grown, a cube foot weighing over 52lb. It is used for carriages and waggons, as well as for implements and machinery; it makes good tool-handles. A radial section of this wood, which is light brown with creamy-white sapwood, shows little figure; but a bastard cut, or triangular section, shows figure, with open ducts distinctly marked on each ring boundary. When this tree is sufficiently old, long plates of the outer bark hang loosely from the trunk and branches, and this peculiarity gives the tree its name. Hickory is also obtained from *Hicoria Alba*, *H. Glabra*, *H. Minima*, and *H. Pecan*, known popularly as Mockernut Hickory, Pignut Hickory, Bitternut Hickory, and Pecan; the latter being a common tree in Indiana and Nebraska, and southwards to Louisiana and Texas. Hickory is brought into the market here in round logs, and sold by the cube foot, Customs string measure; poles are also sold at so much each, 12ft. long by 4½in., tapering 3½in., 4in. tapering to 3in., and 3in. tapering to 2½in. HORNBEAM (*Carpinus Betulus*) is found all over Europe; it is indigenous in the south of England, but it is planted in the North and in Ireland. Nearly all the hornbeam used here comes from France. It is a tough, close-grained, durable wood, with no heart, the wood always remaining in the condition of sapwood, a peculiarity which makes some people think it is all heartwood, as no change can be distinguished in the trunk. It is worth, in the round log, 10½d. to 11d. per foot cube.

PRACTICAL BUILDING CONSTRUCTION.*

A REVISED and enlarged edition of the above treatise on building construction, by John Parnell Allen, Lecturer on Building Construction at the Durham College of Science, Newcastle-on-Tyne, &c., has been published in which the author has brought this useful handbook up to date, and has extended its pages to meet the requirements of education authorities. Practical matters of everyday occurrence have been dealt with, including those branches of work allied to building, such as electric lighting, and other branches of engineering, &c. The author acknowledges his indebtedness to Mr. Thomas Hanning, A.M.I.C.E., for valuable advice and

* Practical Building Construction: A Handbook for Students. By JOHN PARNELL ALLEN. Fourth edition, revised. With over one thousand illustrations. London: Crosby Lockwood and Son.

The general works committee of the Coventry city council have passed plans for a new street from Gosford-street to Whitefriars-street, and recommend that the work be carried out by the direct employment of labour at an estimated cost of £1,660, whilst it is recommended that the sanction of the Local Government Board be sought to a loan of £2,137 for the making-up of Bricksell-lane.

KING'S COLLEGE AND CARPENTERS' COMPANY'S CLASSES.

THE following is the list of prize-winners and certificates awarded in the examinations at the conclusion of the classes held at King's College in Building Construction, the Studio, Constructional Drawings and Quantities, and Architectural History, under the joint control of King's College and the Worshipful Company of Carpenters.

LIST OF PRIZE WINNERS.

FACULTY OF SCIENCE. DIVISION OF ARCHITECTURE. EXAMINATION IN BUILDING CONSTRUCTION.

Perkins, J.	£2 in books and 1st class certificate.
Hampshire, E. L.	£1 10s. " and 1st " "
Hopkins, W. I.	£1 " and 1st " "
Norton, A.	1st class certificate.
Winteringham, C.	1st " "
Payne, A. C. H.	1st " "
McLachlan, I.	1st " "
Nichols, W.	1st " "
Blomfield, C. G.	2nd " "
Bentley, O.	2nd " "

SANITARY BUILDING CONSTRUCTION.

SIR GEORGE FAUPEL PHILLIPS' MEDAL.

Norton, A. Bronze Medal.

EXAMINATION IN QUANTITIES.

Lodge, A. R. A.	£2 in books and 1st class certificate.
Norton, A.	£1 10s. " and 1st " "
Fairhead, H. A.	£1 " and 1st " "
Blomfield, C. G.	1st class certificate.
Peacock, W. H.	1st " "
Fairhead, H. G.	1st " "
Perkins, J.	2nd " "
Allright, F.	2nd " "
Brice, C. H.	2nd " "

EXAMINATION IN CONSTRUCTIONAL DRAWING.

Judges, W. H.	£2 and 1st class certificate.
Martin, C.	£1 10s. and 1st class certificate.
Ixer, S.	£1 and 1st " "
Perkins, J.	1st class certificate.
Winteringham, C.	1st " "
Blomfield, C. G.	2nd " "
Guimaraes, R. A. F.	2nd " "
Cooper, A.	2nd " "

FACULTY OF ENGINEERING.

EXAMINATION IN ARCHITECTURAL HISTORY.

Ixer, S.	1st Class.
	£2 in books.
	2nd Class.
Sefton, H. W.	£1 in books.
Dunn, G. M.	Certificate of Merit.
Ling, R. B.	" " "
Hunt, H. C.	" " "
Covernton, C. H.	" " "

3RD CLASS.

Strudwick, F. J.	Keed, E. G.
Jorgenson, J.	King, H. W.

ARCHITECTURAL SKETCHING CLASS.

Ixer, S. £1 in books.

STUDIO, EVENING.

Nicholls, J.	£2 in books and certificates of distinction.
Gomme, S. A.	Certificate of distinction.
Smith, E. T. L.	" " "
Smith, J. B.	" " merit

The library and museum in connection with these classes is being revised and added to during the recess, as also the fees and prizes, and a new catalogue of the numerous exhibits and reference drawings will be ready before the opening of the Session 1903-4. The opening of the 14th Session will take place on September 28 at 7 p.m., and the examination for the two free scholarships will be held on September 21, 7 to 9 p.m. Further particulars will be duly advertised.

THE TESTING OF BITUMENS FOR PAVING PURPOSES.*

IT is very evident, from the literature on the subject, that the theory of asphalt construction is but little understood. This is because the proper physical laws are not applied in reasoning on this subject, which is not surprising when we consider that the other cementing materials in general use in engineering work are solids, and involve the laws governing the cohesion and adhesion of solids to each other; while in the case of asphalt construction we have entirely different principles involved—those governing the cohesion of liquids and adhesion of liquids to solids, for asphalt paving cements are fluids in every sense of the word. It is either because this fact is unknown, or because it is not taken into account by analysts and engineers, that the majority of literature on the technical examination of asphalts is so lacking in value.

To illustrate this better, a description of how one class of asphalt pavement is constructed and

a discussion of its properties will not be amiss. What is known as a sheet asphalt pavement is made by coating sand with an asphaltic cement. As the asphaltic cement used is excessively viscous at ordinary temperature, this mixing is of necessity done while the materials are heated to a degree sufficiently high to render the cement so liquid as to coat the sand readily. This mixture of sand and asphaltic cement is spread on the street and compressed into a continuous sheet by means of rolling. These operations are performed while the mixture is heated, as it is more easily handled and compressed while in this state. This pavement must have the following properties:

(1) It must be composed of such a material that it will not crush or be ground away by traffic at any climatic temperature. To accomplish this it is evident that the asphaltic cement which surrounds the sand grains must be pliable and elastic at all temperatures, for if it were solid and rigid the mixture would soon grind away.

(2) As an asphaltic pavement is laid in one continuous sheet, it is necessary that the cement used be so ductile, even at the lowest temperature obtained, that the pavement may contract without cracking.

(3) It is also necessary that the pavement be so firm at the maximum climatic temperature obtained as to withstand the passage of traffic without either being cut into so badly as to be objectionable, or shored to the side of the street.

(4) The paving mixture must be so dense as to preclude the entrance of water into its voids, for if water enters and freezes, the mixture is expanded and becomes spongy, and if the asphaltic cement is not sufficiently pliable, it will wear away by abrasion.

(5) The pavement must not contain any material that is acted on by water, for even though a paving mixture be used that is so dense as to preclude the entrance of water into it, yet the mixture being pliable under the passage of traffic, water will work up into it.

(6) The pavement must not contain an asphaltic cement that will age so rapidly as to cause the pavement to lose its pliability within a reasonable period of time.

It is evident if a pavement possesses all these qualities, that it will be durable under all normal conditions.

Although the use of different sands in a pavement will change its physical properties somewhat, yet they are principally dependent on the physical properties of the asphaltic cement with which it is constructed. A pavement, to possess the properties above enumerated, must contain an asphaltic cement which will be so ductile at the minimum temperature obtained in the climate in which it is laid as to permit a contraction of the pavement without cracking. At the same time, the asphaltic cement must not be rendered so fluid by the maximum climatic temperature that it will produce a pavement objectionably soft.

The asphaltic cement must have the properties of a liquid at all temperatures to which it will be subjected. It is upon this property that the adhesiveness of an asphaltic cement depends—that is, comparing two asphaltic cements of the same degree of consistency, the one that approaches more closely to being a true liquid possesses the greater adhesiveness. This is true not alone from observation, but is self-evident when we examine into the reason that a bituminous cement is adhesive. The property of adhering is not chemical, but purely mechanical, and the more fluid the cement is, the more completely and perfectly will it flow into every cavity of the surface with which it is in contact, thus producing a more perfect bond of adhesion. The less fluid an asphaltic cement is, the more imperfect is the solution of two or more of its constituents in each other.

Besides these physical properties, the asphaltic cement must be able to withstand the heating to which it will be subjected in the process of manufacture into pavement, without having its physical properties materially changed, and the asphaltic cement must not be rapidly hardened or so changed by age as to lose desirable physical properties, such as ductility and pliability, in an unreasonably short period of time.

For the determination of the above properties Mr. Dow has devised the following tests:

Ductility.—The ductility of an asphaltic cement is determined by ascertaining the distance that a prism of this cement can be drawn out before breaking. This test he makes at 20 and 77° Fahr.

The one that is the more ductile is the more perfect fluid, and hence the most cementitious.

Softness at High Temperatures.—The softness of an asphaltic cement at high temperature he determines by ascertaining its consistency at 32, 77, 100, and 115° Fahr. The rate of softening of an asphaltic cement is thus determined, and an idea can be formed as to whether it will be too soft for use at the maximum climatic temperatures.

Fluidity.—As to how true a fluid an asphaltic cement is, the determination is made as given above, by ascertaining its ductility.

Heat Test.—To ascertain whether the asphaltic cement will be injured by the heating which it must undergo during the process of manufacture into the pavement, is determined by submitting a quantity of asphaltic cement of known consistency by penetration at 77°, to a temperature of 300° for eight hours. During this heating the asphaltic cement is stirred from time to time to break up any skin which may form on its surface, thus protecting it from evaporation and oxidation. After this heating the cement is allowed to cool, and its consistency by penetration is again taken at 77°, the difference in penetration being the amount of hardening resulting from the prolonged heating.

Change due to Ageing.—All bitumens undergo a more or less rapid change with ageing, that appears to be due to two, or possibly more, causes. Two distinct changes manifest themselves. One is the surface-hardening, which is probably due to oxidation, and possibly due to the volatilisation of light oils. It begins at the surface, and gradually extends into the bitumen. The other is a hardening of the entire mass, evidently due to condensation of molecules. Both these changes take place in all bitumens, but one or the other may predominate. The former is much the less objectionable, as it makes but slow progress into the mass.

The best method for determining the ageing of the asphaltic cement, although it is somewhat slow, is as follows:—The asphaltic cement is placed in a sample tin, and its consistency by penetration determined at 77°. This sample is then put away in some place protected from the dust, but without a cover, so as to have free access to the air. At the end of two weeks or a month the consistency of the sample is again tested at the same temperature, when it is again put away. This testing every few weeks is kept up until the sample is appreciably hardened. A slanting cut is then made into it with a sharp thin knife, laying over the upper piece, this exposing a gradual descent from the surface into the interior of the cement. Penetrations are now taken down the side of this cut, beginning at the surface. In this way the increase in hardness of the surface and the interior over its original consistency is determined; also, the hardening of the surface over the interior, and the depth that the surface-hardening has entered the sample.

Another method which Mr. Dow has lately employed, and which is somewhat more rapid, is by taking an asphaltic cement of known consistency by penetration at 77°, and spreading 50 grams of it on a piece of plate-glass 9 in. square. The plate thus coated is placed in a dustproof drawer. At the end of two weeks or a month the coating of cement is scraped from the plate by a steel straightedge, and moulded into a suitable receptacle at the lowest temperature possible. The consistency by penetration is again taken, and the increase in hardness of the asphaltic cement indicates its rapidity of ageing. This method, of course, does not differentiate between the two hardenings.

As all asphaltic cements are not of the same degree of purity, it is necessary for comparison that the tests for their physical properties be made on a basis of the pure bitumen. For this reason it is necessary to ascertain the relation existing in the various tests made on the asphaltic cement, and the pure bitumen it contains. After such a ratio has once been established, test can be made on the asphaltic cement, and allowance made for the impurities other than bitumen. Due allowance can then be made in comparing the results of physical determinations on cements of different purities.

Carbon Disulphide Soluble.—As the cementing material in a paving mixture or asphaltic cement is the pure bitumen it contains, an extraction with carbon disulphide is made to ascertain the amount of this cementing material. It is also of use to determine the purity of an asphaltic

* Abstract of a paper read by Mr. A. W. Dow before the American Society for Testing Materials.

cement to aid in drawing conclusions from the physical tests.

For the extraction of bitumen some experimenters advise the use of other solvents, such as chloroform and turpentine, because they extract more from bituminous materials than does carbon disulphide. The use of these more powerful solvents is unnecessary and confusing, as, at its best, this test is only comparative, for there is strong evidence to show that even carbon disulphide, in the case of some asphaltic cements, dissolves more bitumen than really acts as a cementing material, and in the cases where all the bitumen appears to be cementitious, the chloroform and turpentine dissolve little if any more than does the carbon disulphide. This being true, Mr. Dow sees no reason for adopting a still more powerful solvent. Carbon disulphide also has the advantage that it is more readily obtained pure, is less hygroscopic and cheaper than chloroform and turpentine.

Naphtha Soluble.—The test for the amount of bitumen soluble and insoluble in naphtha, or as it is better known, the test for the petroleum and asphaltine, is usually made by extracting the asphaltic material with petroleic ether. The bitumen that dissolves in the solvent is called petroleum, and that portion which is insoluble but which dissolves in carbon disulphide is spoken of as asphaltine.

Mr. Dow believes there has never been a test that has caused more confusion than this, by its being misinterpreted and its value over-estimated. It is of no value at all, as is sometimes claimed, in determining whether or not an asphalt will make a good pavement. The amount of bitumen soluble in naphtha is of no value excepting as indicating, within broad limits, the degree of hardness of an asphalt. The test is of advantage because it requires no apparatus other than is found in every chemical laboratory, and if standard methods could be adopted, it would be of value as indicating in a limited degree the consistency of the asphalt.

Action of Water on Pavements.—The action of water on asphalt pavements has, in the past, received little or no consideration from engineers. This question is a very important one, and the asphalt should be examined to determine whether or not it is attacked by water or moist air. There are many failures resulting from this action that have been blamed to other causes in the past, and a more thorough study of this subject is much to be desired. A simple method to ascertain the rapidity of the action of water is to coat a piece of glass with the asphalt paving cement, and partly submerge this coated glass in water. The coating is examined at intervals, and the time noted when the first discoloration or action is noticed on the surface of the sample.

Another method sometimes used is to mould two lin. cubes of the paving mixture under a fixed pressure. This mixture is made with a standard sand, and the same amount of bitumen used each time. One cube is immersed in water while the other is kept in air. These cubes are examined at the end of a month or two, and any increase in the volume or softening of the one in water over the one kept in air is noted.

Among the alterations now in progress at the City Temple, London, is the removal of the large platform which was built round the pulpit. Although this rostrum was convenient for public meetings, it detracted very much from the appearance of the pulpit, and hid the pillars and arches beneath it. When the building is reopened, the gift of the City Corporation to Dr. Parker will again be visible in its original form.

The extensive business premises of Messrs. Jarrolds, publishers, at the junction of London-street and Exchange-street, Norwich, and facing the great Market Place, are being rebuilt from plans by Mr. G. J. Skipper, F.R.I.B.A., of Norwich, and at the same time the ground floor of the frontage to Exchange-street will be set back 5ft., the upper stories being carried on a colonnade.

The Countess of Leicester opened, last week, a new nurses' home in connection with the Norfolk and Norwich Hospital at Norwich. The Earl of Leicester had already contributed £15,000 to found the home, and Lady Leicester announced that he had given another £5,000, the income of which is to be permanently devoted to the maintenance of the home.

A memorial to the members of the King's Liverpool Regiment, who fell in the South African War, is about to be erected in St. John's Gardens, Liverpool. The commission has been intrusted to Mr. Goscombe John, A.R.A.

COMPETITIONS.

MANCHESTER ROYAL INFIRMARY.—The Board of Management of the Manchester Royal Infirmary held a special meeting on Wednesday to consider the selection of architects to prepare competitive plans for the new infirmary, which will be built on the Stanley-grove site. Out of 56 names submitted, the building committee, on the recommendation of the architect assessor, had selected twelve to prepare plans. The board approved the twelve, as follows:—Mr. H. Percy Adams, London; Messrs. Campbell, Douglas, and Paterson, Glasgow; Messrs. Edwin T. Hall and John Brooke, London; Mr. W. Cecil Hardisty, Manchester; Messrs. Heathcote and Sons, Manchester; Messrs. Henman and Cooper, Birmingham; Mr. John W. Simpson, London; Messrs. Thomson and Sandilands, Glasgow; Mr. A. Hessel Tiltman, London; Messrs. Waddington, Son, and Dunkerley, Manchester; Messrs. Thomas Worthington and Son, Manchester; and Messrs. Young and Hall, London.

NEWCASTLE (STAFFS).—For the erection of new Wesleyan Sunday-schools and caretaker's house the designs sent in by Messrs. Garside and Pennington, architects, Pontefract and Castleford, have been accepted, and they have been appointed architects for the work. The estimated cost is about £2,000. The designs were submitted under a *nom-de-plume*, and the trustees engaged professional advice and adopted the report of the assessor.

TAUNTON.—There were 81 designs submitted in the competition for the Carnegie Free Library, Taunton, and these will be on view on Saturday and during next week from 12 till 7 at the Municipal Hall. The assessor, Mr. J. Gibson, London, has awarded the premiums as follows: No. 51, Mr. A. Colbourne Little, 9, Gray's Inn-square, London; No. 29, Mr. J. Lindsay Grant, 2, St. Peter's-square, Manchester; No. 42, Mr. Henry A. Crouch, 12, Gray's Inn-square, London.

CHIPS.

The urban district council of Featherstone have adopted plans by Mr. George Hodson, C.E., of Loughborough, for sewerage the district at an estimated cost of £12,625.

The corporation of Bristol is building, on the recommendation of the health committee, a lodging-house for casuals in Wade-street, to provide 120 beds, at a cost of over £7,000.

For some time past complaint has been made of the difficulty of hearing preachers in the nave of Ripon Cathedral, and to overcome this objection a sounding-board for the pulpit in the nave has just been constructed. The board has been supplied by a New York firm.

Princess Henry of Battenberg has consented to unveil the memorial to Queen Victoria at Newport, Isle of Wight. It consists of a column of Illopton Wood stone, rising to a canopied head, and finished with a spirelet and cross. Around the base are four erect female figures, emblematic of the Virtues, and over the die and steps of Portland stone are grouped couchant lions. The architect is Mr. Percy G. Stone, F.S.A., whose design, selected in open competition in which fifty schemes were received, was illustrated in the BUILDING NEWS for July 11, 1902.

Lord Monkswell, chairman of the London County Council, last week opened the Fulham Park extension for the public use. The land is the remaining portion of west meadow (known as Fielder's Meadow), and contains nearly nine acres. It lies to the north of Fulham Park. A contribution of £12,000 was made by the County Council towards laying out the added area, which was the gift of the Ecclesiastical Commissioners.

A stained-glass window has been given to Egg Buckland church in memory of the late Mr. Richard Risdon, a former mayor of Plymouth. It represents the parable of the Good Samaritan. In one light the Good Samaritan is ministering to the wounded man sitting by the roadside, while in the distance the priest passes by. In the other light he is supporting the wounded man as he takes him to a place of safety. The work has been executed by Messrs. Fouracre and Son, of Stonehouse, Plymouth.

The Merchant Venturers' Technical College at Bristol is to be greatly enlarged by new workshops by and laboratories, increasing the present floor area 12,000ft. The space now available for the mechanical laboratory will thus be more than doubled, while the electrical engineering laboratory will be enlarged to a nearly equal degree. The hydraulic laboratory will be much increased in size, and an entirely new physical laboratory will be arranged for.

PROFESSIONAL AND TRADE SOCIETIES.

HAMPSHIRE ARCHAEOLOGICAL SOCIETY.—The members of the Hampshire Field Club and Archaeological Society spent a very interesting day in South-east Hants last week, and crossed the border into Sussex to visit Westbourne and Bosham Churches. The first halt was at Warblington, in Hampshire, which possesses an interesting church with Saxon remains, and had an equally interesting castle, of which but little is now above ground. The castle was the birth-place of Bishop Cotton, of Salisbury (temp. Elizabeth), and the temporary home of the Countess of Salisbury, the mother of Reginald Pole. Some interesting notes on the historical associations of the place were read by Mr. T. W. Shore. The church of St. Thomas à Becket is assigned by tradition to the generosity of two maiden ladies of the house of Warblington, and stone coffins with female effigies have been found in the aisles. The south side of the nave has some fine clustered columns, which are in striking contrast to the plainness of those on the north side.

ROYAL ARCHAEOLOGICAL INSTITUTE.—At the concluding business meeting, held on Monday night in York, Sir Henry Howorth (president) in the chair, the place of next meeting was discussed, and Bath and Bristol, Ireland and Normandy were mentioned, the president suggesting that a joint meeting with the French Institute might be arranged for Normandy. A discussion arose in reference to the best method of studying archaeology and history. Sir Henry Howorth, in proposing a vote of thanks to the French delegates, said the English archaeologist was gaining much from a comparison with the clear and logical expression of the French scientists. Mr. Micklethwaite, in seconding the motion, which was passed, recognised with satisfaction the growing interest which French and Italian archaeologists are displaying in English architecture and antiquities.

Mr. A. D. Price, M.I.O.S.E., an inspector of the Local Government Board for Ireland, has held an inquiry at Lisburn into the urban district council's application for a loan of £34,000 for sewerage purposes.

The rural district council of Chesterfield recently considered a scheme of water-supply for the southern districts, estimated to cost £18,000. The scheme, which has been prepared by Mr. Firth, the water engineer, and provides for two service reservoirs, was adopted.

A new theatre to accommodate 1,320 persons is to be built at the corner of High-street, Lewisham, and Hither Green-lane, from plans by Messrs. Briggs and Jeyes.

Public swimming baths are to be erected by a syndicate in Kirkcaldy, and plans are being prepared by Mr. Swanston, architect. The baths include Turkish, Russian, and plunge baths, also recreation rooms, consisting of billiard and reading rooms, and a gymnasium. The buildings are estimated to cost from £10,005 to £12,000, and they will be erected in Sands-road, at the foot of Tolbooth-street.

For the erection of a new lecture-hall at Bardney, in connection with the Wesleyan chapel, the tender of Mr. B. Fanthorpe, Lincoln, for £364 18s., has been accepted. The architects are Messrs. W. Mortimer and Son, Lincoln.

Last week in the belfry of St. Sidwell's tower, Exeter, the Rev. M. Kelly, of Kelly House, Lifton, and President of the Devon Guild of Ringers, unveiled an alabaster tablet presented by Messrs. Hems and Herbert (Vice-Presidents of St. Sidwell's Society of Ringers) to record the first peal of Grandirecaters ever rung by an Exeter band alone, and who were members of St. Sidwell's Society. Mr. Lucas (the junior Warden) thanked Messrs. Hems and Herbert, and spoke of the artistic way in which the work had been carried out by Mr. Hems.

A handsomely carved and embellished obelisk of Portland stone, designed by Mr. Reginald Blomfield, was unveiled at Haileybury College on Saturday afternoon, by Lieutenant-General Sir John French to the memory of thirty-five Old Haileyburians who fell in action or died of wounds or disease in the South African War.

The memorial which the Navy League have had placed in the south wall of St. John's Church, Ladywood, in honour of Walter Grounds, who was the champion shot in the British Navy, was unveiled last Sunday morning by Mr. Arnold White. The memorial is of beaten bronze, oval in form, and 3½ft. in height, bearing a representation of the *Terrible* over an inscription testifying to the qualities of the deceased.

Building Intelligence.

BELFAST.—The Royal Victoria Hospital, Belfast, was opened by their Majesties the King and Queen on Monday. The building occupies an excellent site of six acres at the junction of Grosvenor-street and Falls-road. The architect is Mr. William Henman, F.R.I.B.A. Working drawings were prepared in conjunction with his partner, Mr. Thomas Cooper, A.R.I.B.A., and in the autumn of 1900 a contract was entered into with Messrs. McLaughlin and Harvey, builders, of Belfast, who have carried out the work. Messrs. Henry Lea and Son were appointed consulting engineers, Mr. G. A. Flower acted as clerk of works, Messrs. W. H. Stephens and Son being the quantity surveyors. The accommodation provided is for 300 patients, eight resident medical and surgical officers, a superintendent, a matron, 78 nurses, and 32 male and female servants. The novelty in the design is that the whole of the accommodation for patients is on the ground-floor level; the wards (19 in number), with their accessory rooms, being placed side by side, lighted by large end windows, having a pleasant outlook to the south over park-like land, and by side clerestory windows. This is insured by the employment of economical means by which the whole atmosphere of the building is changed ten times per hour in summer and seven times in winter, without the necessity for opening any windows. The air is cleansed and tempered, so that both by night and day the whole hospital is maintained in a fresh and wholesome condition, without draughts or open fireplaces, and the noise, dirt, and attention they require. An important consideration in connection with this new principle of hospital construction is its economy, £300 per bed being the limit of outlay on the buildings and all engineering requirements. We fully illustrated and described the hospital in our issue of May 31, 1901, when a plan and two views of the building were given.

BRIDLINGTON QUAY.—An inquiry has been held at Bridlington Quay into the construction of the new parade extension scheme embracing sea defences, a new footpath, and pavilion, at a total cost of £32,800. Messrs. Mannall and Littlewood are the architects. Mr. W. H. Littlewood explained the designs for the new pavilion and shops. The building was to be octagon in shape, and shelter accommodation provided for 2,000 persons. On the western side would be a raised gallery. The building would be mainly of timber and iron, with plate glass in front, and large windows on three sides. There would be four entrance swing-doors, and in addition the whole of the glass front would be made to open in case of necessity. An octagon lantern light in the centre of the large hall would act as a ventilator, and windows around would open. The roof of the refreshment-rooms was to be of concrete, to be used for promenade or refreshment purposes, and a raised platform would be built in the hall to accommodate forty performers. Dressing-rooms and other necessary offices were specified.

BROADWATER DOWN.—The Church of St. Mark, Broadwater Down, has recently had an addition made to it in the shape of a large and handsome choir vestry, at a cost of £700. The material is sandstone, and the dressings, the traceried windows, string-courses, rear arches, lintels, &c., are in Box Ground Bath stone. The vestry has been built in keeping with the church, the architects being Messrs. Roumieu and Hitchison (the senior partner being son of the late architect of the church), and the builders Messrs. George Mansfield and Son, the same firm which thirty-eight years ago built the church itself. The reredos has been redecorated, the screen between the chancel and clergy vestry put back far enough to give another row of choir stalls, the door into the chancel has been widened and a wider passage made for the entry of the choir, the old reading-desk removed, and a carved chair and desk placed in the chancel.

CAMBERWELL.—The formal opening of a large block of buildings forming the extension of the Camberwell Infirmary and involving an outlay approaching £200,000 took place last Friday. The old infirmary in Havit-street has been altered and modernised to form part of the larger institution, which is now practically completed. It covers a site of several acres, and provides accommodation for 800 patients and a staff of about 200 persons. There is a fully-equipped operating

theatre, with recovery-room attached, and an electric treatment-room with all modern appliances. The building is electrically lighted; it has electric lifts of a special labour-saving type, electric ventilation, and is heated on a system existing only in one other institution in London. The site faces Brunswick-square (a well-wooded open space recently acquired for the public), and, although close to the main highway, is quite removed from the noise of the traffic. Special provision has been made for the application of the open-air treatment to consumptive patients.

CARLIS BAY.—A new chapel erected by the Wesleyans at Carlis Bay was opened for worship on Friday. The church is of Gothic design, the materials being granite dressings with grey elvan stone. A tower rises at the north-east angle to the height of 65ft. In the main front there are four windows of stained glass. The seating accommodation is for 250. Mr. Oliver Caldwell, Penzance, is the architect, and Mr. Glasson, Carlis Bay, the contractor, the plumbing being carried out by Mr. S. R. Taylor, Penzance. The contract price was £1,800.

LEEDS.—The old Police-station in Beeston-road, Leeds, has been discarded and a new one erected in its place. At the same time the corporation authorities have embraced the opportunity to provide a free library, which forms part of the structure. The new building, which occupies a site at the corner of Dewsbury-road and Hunslet Hall-road, was opened last Friday. In the police-station the architects, Messrs. F. W. Bedford and S. D. Kitson, have done everything possible to facilitate the work of the officers, whilst they have not overlooked other requirements. The five lock-up cells, lined and vaulted in glazed brick, are under the eye of the constable in charge, and on the ground floor there is also a large parade-room, with access to an open drill-yard. On the floor above, provision has been made for six constables to sleep, whilst adjoining the bedroom there is a kitchen and recreation-room. A reel-house has also been designed to accommodate two engines, with storage-room for hose-pipes and other fire appliances. The library is situated at the southern end of the site, and has three entrances, leading through a large hall into the library itself, the general reading-room, and the ladies' room. Provision has been made for over 20,000 volumes.

PORTSLADE-BY-SEA.—New schools in this growing suburb of Brighton were opened by the Lord Bishop of Chichester on the 22nd inst. The walls are of brick, plastered throughout, with painted cement dados. The roofs are covered with tiles, the floors of school and classrooms laid with wood blocks, and the corridors, caprooms, and lavatories with granolithic paving. The warming is by open fireplaces, and the ventilation on Boyle's system, with a central spirette. The latrines and fittings combine all the most recent improvements, and the cost per head for the school buildings and offices works out at £5 13s. 6d. The architect was Mr. E. H. Lingen Barker, of London, Bristol, and Hereford, and the contractor Mr. G. H. Eastwood, of Market Harborough.

SWANSEA.—The new convalescent home in connection with Swansea Hospital has been opened. It consists of three blocks. The centre one is the administrative block, and on either side, approached by open corridors, are two ward blocks—one ward for men and one for women. The accommodation provided in each ward block is a large dayroom, a ward for ten beds, bath-rooms and lavatories, with verandahs running the whole length of the buildings. This accommodates twenty patients. The work generally is of local stone, with brick quoins and rough-cast; the top floor of the administrative block has the walls covered with red Broseley tiles, and all the roofs are covered with terracotta slates. The contract has been carried out by Mr. Griffith Davies. Mr. Daniel Evans has fulfilled the office of clerk of works, and the whole of the work has been designed and carried out under the supervision of Mr. Glendinning Mexham, architect, Swansea.

WEDNESFIELD.—On Friday last the Bishop of Lichfield conducted the dedication service of the parish church, Wednesfield, near Wolverhampton, which has been restored since its destruction by fire in the early part of last year. Drawings were prepared by Mr. F. T. Beck, diocesan surveyor, and the contract was placed in the hands of Messrs. H. Willecock, of Wolverhampton. The

whole of the edifice has been rebuilt, except the main walls of the nave and the tower at the west end, which have been repaired and pointed, and new balustraded parapets erected in accordance with the original designs for the church, prepared at the time of its rebuilding and enlargement about the year 1813, by Messrs. Wyatt and Brandon. A chancel has been added sufficiently spacious to accommodate choir and clergy, seats for whom were formerly in the nave; the organ-chamber has been enlarged, vestries for choir and clergy provided, and a semicircular apse added at the east end. The building is constructed of brick with stone dressings, and the roofs covered with slates. The clock, which was entirely destroyed, has been replaced by a new one by Messrs. John Smith and Sons, of Derby. The total cost is about £5,000.

WORMWOOD SCRUBS.—Mr. Long, the President of the Local Government Board, laid the foundation-stone, on Monday, of a new workhouse and infirmary about to be erected by the Hammersmith Board of Guardians at Ducane-road, Wormwood Scrubs, W. The buildings will stand on a site which is about 15 acres in extent. The infirmary buildings, which occupy the front portion of the site in Ducane-road, facing south, will accommodate, in the first instance, about 350 patients, but are capable of extension so as to afford accommodation for about 600, and comprise official quarters, administrative departments, patients' blocks, and a separate nurses' home. The workhouse is designed to accommodate in the first instance 400 inmates, and it will have sufficient administrative accommodation to allow of an extension for about 800 inmates. A large workshop block is to be erected in proximity to the workhouse pavilions, and also a large laundry common to the two institutions. The architects are Messrs. Giles, Gough, and Trollope, of Craven-street, W.C.; and the builder, Mr. Thomas Rowbotham, of Birmingham. The cost is a little under £200,000.

CHIPS.

The Nantwich Board of Guardians are about to erect an infirmary and nurses' home in connection with the union, at a cost of £6,990.

The new pulpit and window recently erected in the parish church, West Bromwich, were dedicated on Sunday week.

Two memorial windows overlooking the side chapel in St. Mary's Church, Stretton, were unveiled on Wednesday week.

The Willenhall School Board have made a practical move in the direction of technical instruction. A contract has been placed for the erection of a permanent metal workshop and chemical laboratory at the Central School. The metal workshop will cover an area of 53ft. by 20ft., and will accommodate 25 students.

On Tuesday week the corner-stone of the building which is being erected on Church Hill for the Walsall Brotherhood was laid. The cost of the building is to be about £1,600.

The foundation-stones of the Hazel-grove Reform Club was laid on Saturday afternoon by Mr. J. Emmott Birlow, M.P., Mr. T. Carter Bealey, Liberal candidate for the Hyde division, and Mr. F. W. Stoneacre, chairman of the Stockport Liberal Association. The new club when completed will be a handsome building of brick and Portland stone, and will cost about £1,500.

The Hebden Bridge Urban District Council have received sanction from the Local Government Board to borrow £10,230 for their proposed electricity scheme.

Mr. W. D. Carré, M.A., F.S.A., architect to the Ecclesiastical Commissioners, has been admitted to the freedom of the City on the presentation of the Plumbers' Company.

The bells of Lessingham Church, Norfolk, are being rehung. Mr. Augustus Myhill, of Catfield, the leading campanologist in the district, is superintending the work. Solid oak is used for the frame and the gear of the bells. The wrought-iron work is being supplied by Mr. W. R. Draper, of St. Mary's Ironworks, Stalham.

The new post-office at Oundle has been opened. The contractors, Messrs. Siddons and Freeman, invited a few guests and the post-office staff to view the premises.

The Oakwell Joint Infectious Hospital, Birstall, Yorks, is being warmed and ventilated by means of Shorland's patent Manchester stoves, with descending smoke flues and patent Manchester grates, the same being supplied by Messrs. E. H. Shorland and Brother, of Manchester.

THE VICTORIA HALL, SUNDERLAND.—THE "CROWN AND MITRE," CARLISLE.—LIVERPOOL CATHEDRAL.—R.I.B.A. PUGIN TRAVELLING STUDENTSHIP DRAWINGS—FENTON PUBLIC LIBRARY: SECOND PREMIATED DESIGN—DESIGNS FOR A WAYSIDE TAVERN AND TWO COTTAGES.

Our Illustrations.

SELECTED DESIGN, VICTORIA HALL, SUNDERLAND. This design was selected in open competition, and awarded the first premium by Mr. H. T. Hare, F.R.I.B.A., the assessor. The block

MEZZANINE FLOOR OVER MAIN ENTRANCE

GROUND FLOOR PLAN

VICTORIA HALL, SUNDERLAND.

Newcastle-on-Tyne. The hotel entrance is in the centre of the principal front, with large shops occupying the remainder of the valuable frontage. A commodious assembly-hall is provided at the rear with ample entrances and exits. The frontage is being built with Accrington bricks, with red stone dressings from Cove Quarries, and the roof covered with green Westmoreland slates. The principal contractors are Messrs. Beatty Bros., for the mason work, and Mr. Geo. Black for joiner work. The building has been designed by Messrs. Oliver and Dodgshun, F.F.R.I.B.A., of Carlisle and Leeds, and is being carried out under their supervision. Mr. Thain is the clerk of works.

LIVERPOOL CATHEDRAL.

THIS sheet of details shows the exceedingly refined and admirable character of Messrs. Austin and Paley's design for this building, which was suitably rich without a redundancy of ornament, and, while following precedent, displayed considerable originality and sense of proportion. We have given several illustrations of their design already; but these details of the choir and nave have not been printed before.

PUGIN TRAVELLING STUDENTSHIP DRAWINGS: SKETCHES IN GLOUCESTERSHIRE.

THESE studies are from the pencil of the prizeman, Mr. C. Wontner Smith, A.R.I.B.A., who has favoured us with the accompanying notes respecting the buildings illustrated:—Pershore Abbey is best seen from the N.E., for it is from this point that all that now remains of this famous building, which was contemporary with Gloucester Cathedral and Tewkesbury Abbey, stands revealed. The Norman nave has entirely gone, and also the north transept, so that practically all that is left is the choir, south transept, and tower. This view also shows the enormous buttresses which it was found necessary to erect in order to preserve the stability of the tower.

exhibiting work of all styles, from Norman to Perpendicular. The tower, which stands at the east end of the south aisle, though simple in character, is greatly helped by the beautiful colour of the stonework and the rich embattled parapet.

FENTON PUBLIC LIBRARY: SECOND PREMIATED DESIGN.

WE gave the first premiated design in this competition on July 17; to-day we illustrate the second prize design, chosen out of over eighty others by Mr. Ernest George, who acted as professional referee. It is interesting to compare these two prize designs, and it remains open to question as to whether out of all the large number of plans sent in these two were really the best library plans submitted, taking into account, of course, the money limit, and other conditions. If so, this competition cannot be said to have been distinguished, architecturally, for merit, or for intimate knowledge of the practical requirements of library arrangement. Mr. Stephenson Stout, Whitehaven, is the author of this scheme.

"BUILDING NEWS" DESIGNING CLUB: A WAYSIDE TAVERN AND TWO COTTAGES.

(For description and awards see page. 130.)

CHIPS.

The addition of Heaton Park to the open spaces of Manchester has more than doubled the area of the city parks. Of the 1,103 acres devoted to parks, open spaces, and recreation grounds, 692 are in this latest acquisition, Heaton Park.

The foundation-stones of a new Primitive Methodist church and lecture-hall, which is to be erected in Southfield-road, Middlesbrough, were laid last week. On the ground floor there will be a lecture-hall 52ft. by 34ft., with an infants' classroom, tea-room, and staircase behind. The school above will be 30ft. long by 25ft. broad. There will be five

comprises a large hall with galleries and dress-circle to seat about 3,000 adults. This hall has in immediate connection retiring rooms for chorus and soloists, with lavatories. There is also a smaller hall to seat 700 adults. Both halls are fully provided with cloakrooms and lavatories for ladies and gentlemen. There is also a large banqueting hall, with kitchens, sculleries, services, &c. Both halls will be elaborately decorated. The buildings will be built of special red bricks, with all the dressings of stone; the roofing will be of green Westmoreland slates. Mr. John Eltringham, of Sunderland, is the architect.

NEW HOTEL AND ASSEMBLY ROOMS, CARLISLE.

THESE new buildings are being erected in the Market-place, Carlisle, for Mr. Walter Scott, of

Shipton Court is typical of the larger houses to be found in the Cotswold district. It is extremely picturesque with its high-pitched gabled roofs covered with stone slates, which have weathered to a beautiful colour. This sketch only shows one wing of the house, which has recently undergone some restoration. Campden Church is one of the finest in the district. Chipping Campden was formerly a place of some importance, being in the 14th and 15th centuries the principal market for wool. Many rich wool merchants lived here, and it was no doubt owing to their munificence that this fine church was built. The tower is the most interesting feature of the church, and the curious treatment of carrying one of the buttresses down in front of the west window is worthy of notice. Stow in the Wold, some few miles away, also contains a fine church

classrooms, one being 29ft. by 12ft. The building will be of brickwork, faced with Normandy bricks, with dressings of Closeburn stone, and the roof will be covered with Welsh slates. The lecture-hall will accommodate 300 people. Mr. Henry Walker, of Linthorpe, is the contractor, and the architect is Mr. T. E. Davidson, of Newcastle.

The new Catholic Church of St. Peter, at South Bank, the foundation-stone of which was recently laid by Bishop Lacy, Middlesbrough, will cost over £7,000 and seat 700 persons. Of Gothic design, it will be 115ft. long and 66ft. broad, with a tower 80ft. high.

A report has been prepared by the museums sub-committee of the Burnley Corporation recommending the council to take into consideration the formation of a permanent art exhibition at Towneley Hall, in place of the loan collection recently opened by Lord Rosebery.

LIVERPOOL CATHEDRAL

DESIGN BY AUSTIN & PALEY, ARCHITECTS.

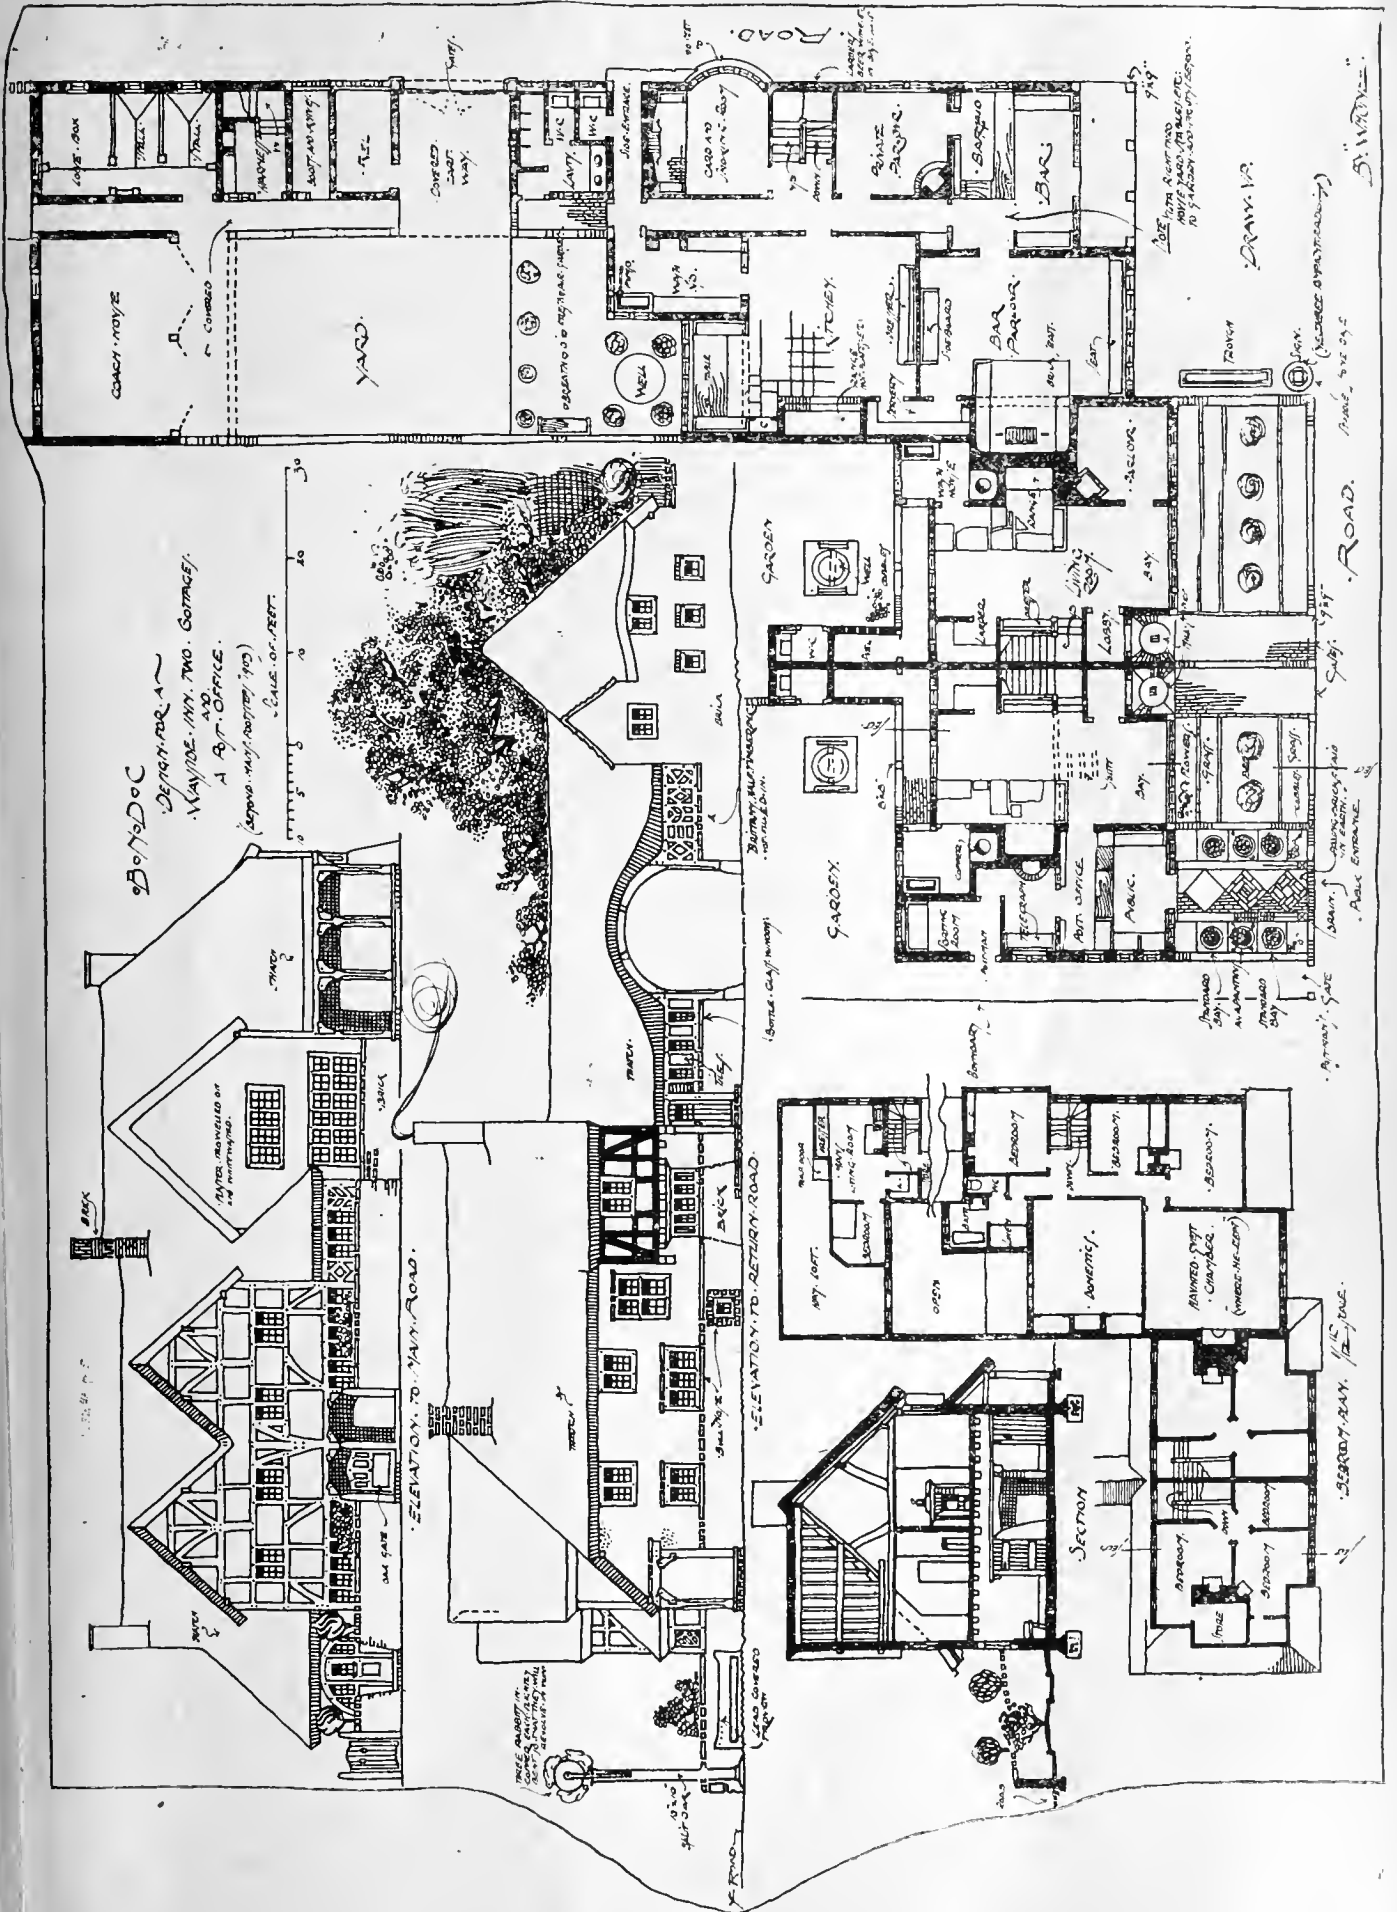

SELECTED DESIGN, VICTORIA HALL, SUNDERLAND.

JOHN ELTRINGHAM, ARCHITECT.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the BUILDING NEWS, Clement's House, Clement's Inn Passage, Strand, W.V., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to THE STRAND NEWSPAPER COMPANY, LIMITED.

Telegraphic Address:—"Timeserver, London."
Telephone No. 1633 Holborn.

NOTICE.

Bound copies of Vol. LXXXIII. are now ready, and should be ordered early (price 12s. each, by post 12s. 10d.), as only a limited number are done up. A few bound volumes of Vols. XXXIX., XLII., XLVI., XLIX., LIII., LXI., LXII., LXIV., LXV., LXVI., LXVII., LXVIII., LXIX., LXXI., LXXII., LXXIII., LXXIV., LXXV., LXXVI., LXXVII., LXXIX., LXXX., LXXXI., and LXXXII. may still be obtained at the same price; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

Handsome Cloth Cases for Binding the BUILDING NEWS, price 2s., post free 2s. 4d., can be obtained from any Newsagent, or from the Publisher, Clement's House, Clement's Inn Passage, Strand, London, W.C.

TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 0d. (or 6dols. 30c. gold). To France or Belgium, £1 6s. 0d. (or 33fr. 30c.). To India, £1 6s. 0d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 0d.

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of eight words, the first line counting as two, the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Situations and Partnerships.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" and "Partnerships" is ONE SHILLING FOR TWENTY-FIVE WORDS, and Sixpence for every eight words after. All Situation Advertisements must be prepaid.

. Replies to advertisements can be received at the office, Clement's House, Clement's Inn-passage, Strand, W.C., free of charge. If to be forwarded under cover to advertiser an extra charge of Sixpence is made. (See Notice at head of "Situations.")

Rates for Trade Advertisements on front page, and special and other positions, can be obtained on application to the Publisher.

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page Advertisements and alterations in serial advertisements must reach the office by Tuesday morning to secure insertion.

RECEIVED.—F. G. J.—R. M. T.—B. J. R.—H. M. W.—K. B. C.—W. A. T.—L. P. C.

Correspondence.

ALLHALLOWS', EXETER.

To the Editor of the BUILDING NEWS.

SIR,—In your last issue you refer to a paper on "Allhallows', Goldsmith-street, Exeter," read by "Mr. E. Harbottle Reed, diocesan architect." May I point out that there is no "E." before my name, and also that there is no diocesan architect? I noted the history of the church from 1194, not 1581.—I am, &c.,

HARBOTTLE REED.

12, Castle-street, Exeter, July 29.

VANDALISM AT STRATFORD-ON-AVON AND ELSEWHERE.

SIR,—It seems somewhat surprising that Miss Corelli has not received more support from the architectural profession during her crusade at Stratford. The demolition of the old cottages, against which she protests, and the substitution of a large modern red brick and stone library upon their site, will undoubtedly produce an

incongruous effect, and in a pastoral town like Stratford, where immediately off the main streets land for the new library can be bought upon very reasonable terms, it really does seem a pity to needlessly destroy the delightfully old-world appearance of the present town. As an example of the injury which may be done by a good building when placed in a wrong position, I would name the huge red-brick structure erected some years since within the precincts of the Tower of London. This structure is utterly at variance with the whole of its surroundings, and its modern heights and proportions make the old Mediaeval buildings of the Tower look almost like toy buildings. Previously the Tower had been described as the most interesting Mediaeval fortress in Europe. Although aware that "a writer that overstates his case weakens his own argument," I, nevertheless, seriously assert that the erection of the building—to which I have referred—in its present position is as much an act of vandalism as would be the addition of a wing in the form of a red brick board school to Westminster Abbey, and if a few of our leading architects would form a small committee and inspect this structure, I am satisfied that they would favour the presentation of a petition to the Government for its removal.—I am, &c., F.R.I.B.A.

CHIPS.

The salary of Mr. J. W. Walshaw, the city surveyor of Peterborough, has been raised by £100 a year.

The new Lancashire Inebriates' Home, Langho, near Preston, has a new illuminated clock striking the hours, and showing the time on four external dials, erected in the tower, the work having been executed by Messrs. Wm. Potts and Sons, clock manufacturers, Leeds, who are now erecting a new illuminated clock for Messrs. Horrockses and Crewdson, Limited, Preston, and have just completed a new clock at the Normanby Estates Offices, Lincolnshire, for Sir Berkeley Sheffield, Bart. All the above are from the designs and plans of Lord Grimthorpe.

Euston Hall, Suffolk, the seat of his Grace the Duke of Grafton, K.G., which was almost entirely destroyed by fire in the spring of last year, is being rebuilt. Externally, the general lines and character of the old buildings are to be maintained; but internally the arrangements have been remodelled to meet present-day requirements. The works are being carried out by Mr. Thomas Heath, of London and Towcester, under the directions of Mr. W. H. Atkin Berry, F.R.I.B.A., of the firm of Kidner and Berry, London.

A co-operative society formed at Plumstead has just acquired 150 acres on the Bostall Heath Estate, on which a new town is to be built; 3,500 houses will be laid out in streets. A peculiarity of the new town will be the absence of churches of any kind, the committee having resolved not to grant sites for any kind of ecclesiastical building in connection with any denomination whatsoever.

On Sunday afternoon, Col. Gallwey, C.B., commanding the 13th Regimental District, unveiled the tablet which has been erected in the parish church to the memory of the Crewkerne soldiers who fell in the war. The memorial is constructed, in the main, of polished English alabaster, resting upon a background of Cornish polyphant. It is surmounted by a pediment, in turn resting upon pilaster columns. The actual slab, of white marble, upon which the names occur is carved to imitate a Union Jack. In the centre of the pediment is a Royal Crown, and the dates of 1899 and 1902 interwoven with laurel leaves on a polished base. Below the names is the motto, "Dulce et decorum est pro patria mori," whilst upon the face of the pilasters occur each hero's initials and the date and place of their respective deaths. Standing on each side, with arms reversed and resting on their guns, are sculptured statues of soldiers in fighting uniform. The work was executed by Messrs. Harry Hems and Sons, of Exeter.

Messrs. Hems and Sons, of Exeter, are engaged in their studios at Exeter upon a new reredos destined for Crewkerne Parish Church, in which a representation of the Last Supper will be introduced and form the central panel. It will be placed in position in September next.

At a meeting of the Newcastle-under-Lyme Town Council on Tuesday evening amended estimates for the sewage disposal works were submitted by Mr. Wilcox, of Birmingham, the engineer for the scheme, amounting to £20,325, which, with the purchase of the necessary land, made the total estimated cost of the scheme £25,800. The estimates were approved, and the town clerk instructed to apply to the Local Government Board for sanction to borrow the amount named.

Intercommunication.

QUESTIONS.

[11993].—Payment of Architect.—A client for whom I prepared plans, specifications, and quantities and obtained tenders (one of which he provisionally accepted) has been unable to further proceed with his buildings owing, apparently, to shortness of money. On pressing him for payment, he requests the return of all plans, specifications, and other documents, though I have not yet received anything in payment from him. Am I justified legally in withholding these until my account is paid, or, at any rate, a substantial payment on account? I offer to give them up on settlement of my charges.—W. A.

[11994].—Shifting River.—A tidal river has altered its course about 100 yards after a flood, and has blocked up a village sewer outlet. What is the most practical method of diverting the river back into its former bed?—X.

[11995].—Tree and Foundations.—What disadvantages would there be in leaving the tree marked A?

Would there be any danger to the foundations of house Foundations of house are taken 3 or 4 ft. below surface of ground. When excavating foundations, roots were cut (one root, 4 in. or 5 in. dia.). Tree, a full-grown elm, 38 ft. high over all; trunk, 18 in. dia.—H. G.

CHIPS.

At a meeting of the Gillingham (Kent) Education Committee, held on Tuesday week, the building sub-committee recommended that competitive plans should be advertised for in respect to the proposed new schools at Napier-road, the total cost of the building, &c., not to exceed £7,500.

The council of the Society of Arts attended at Marlborough House on Monday, when the Prince of Wales, as president of the society, presented the Society's Albert Medal to Sir Charles Augustus Hartley, in recognition of his services, extending over forty years, as engineer to the International Commission of the Danube, which have resulted in the opening up of the navigation of that river to the ships of all nations.

The Countess of Jersey, on Monday evening, laid the foundation-stone of the new free library in Clifden House Grounds, Brentford. Mr. Nowell Parr, the architect, presented a silver trowel and ebony mallet to the Countess.

The Streets and Buildings Committee of Edinburgh Town Council agreed last Friday to recommend the acceptance of estimates amounting to between £4,000 and £5,000 for the reconstruction of the Princes-street Gardens sewer.

The Mayor of Kingston-on-Thames, on Saturday, unveiled, in the Town Hall, a stained-glass window, bearing, amongst other arms, those of King James I. of England and his Queen, Anne of Denmark, the day being the 300th anniversary of the crowning of those Monarchs. The window was originally in the old Town Hall, and after its transference to the new Town Hall it was found necessary to have it renovated, so as to bring it into uniformity with other old stained-glass windows in the building.

A stained-glass window in memory of Dr. J. C. Ryle, first Bishop of Liverpool, was unveiled last week in Emmanuel Church, Southport, by Mrs. Denton Thompson. The window has two subjects—"The Preaching of the Word" and "The Laying on of Hands."

A marble bust of the late Sir Henry William Flower, F.R.S., Director of the Natural History Department of the British Museum, was formally presented to the Trustees of the British Museum by the Flower Memorial Committee, at the Natural History Museum, South Kensington, on Saturday and the Archbishop of Canterbury unveiled it. Mr. T. Brock, R.A., is the sculptor.

Recent building excavations in Vienna have resulted in discoveries of Roman antiquities, notably Roman roof and ceiling tiles, bearing the imprint of the 10th and 14th legends, and coins with the image of the Emperor Constantine (fourth century A.D.). At a depth of 3 ft. a Roman road was laid bare.

The foundation-stone of a new Wesleyan church was laid at Newquay last week. The new church will be situated in the main street, and will cost together with the site, about £10,000. Seating accommodation in the church will be provided for 700 persons, while the schools will be capable comfortably holding 300 children. Messrs. Matcha and Co., Plymouth, are the builders, and Messrs. Withers and Meredith, Launceston, the architects.

LEGAL INTELLIGENCE.

MODEL DWELLINGS AND VENTILATING PIPES.—The National Model Dwellings Company, owners of Queen's Buildings, Borough, were summoned the other day by the Southwark Borough Council for non-compliance with notices served under the bylaws. There were 13 summonses in all, eight relating to the provision of ventilating pipes, and the remainder to sanitary repairs. Mr. Holden, who defended, asked that the first eight be adjourned pending the decision in a similar case taken to the High Court by the owners of Ponsonby Buildings, Southwark. The same points would arise. With regard to the other summonses, the work was practically completed. The magistrate adjourned the eight summonses, and on the others ordered the defendants to pay £5 fine and 10s. costs.

PRECAUTIONS AGAINST FIRE IN FACTORIES CONNECTED BY BRIDGES.—IN THE MATTER OF AN ARBITRATION BETWEEN THE LONDON COUNTY COUNCIL AND TUBBS. —In this case, Mr. Bodkin, barrister, who is the umpire in an arbitration between the County Council and Henry Thomas Tubbs, stated a special case raising a point of law for the consideration of the High Court, and judgment was given recently in the King's Bench Division by the Lord Chief Justice, Mr. Justice Wills, and Mr. Justice Channell. Mr. Tubbs was the owner of Nos. 8 and 9, Lonsden-place, and in 1892 he let No. 9 to Messrs. Fordham and Co., photographic mount manufacturers, and in 1899 he let No. 8 to the same firm. Both of the houses had two entrances, and in No. 8 there was engine power for working machinery which was in use in the house. There was no internal connection between the two houses at all, but on the first floor there had been erected a small bridge or covered way, over which there was a good deal of traffic between the two houses, and which ran from window to window. The premises were used by Messrs. Fordham together in this sense, that some of the work which was done by means of mechanical power in No. 8 was afterwards taken into No. 9 and dealt with. Under these circumstances, the County Council had served upon Mr. Tubbs a notice, under the Factory Act, of 1901, requiring certain precautions to be taken against fire in regard to both houses, which they treated as one factory. Mr. Tubbs admitted that No. 8, regarded by itself, was a non-textile factory, but denied the right to include No. 9 in their notice merely because of the gangway connecting the two premises. On the other hand, the Council said that the premises were one factory, and should be treated as such in regard to precautions against fire. The umpire was of opinion that 8 and 9 were one factory within the meaning of the Act, and Mr. Tubbs now appealed. The Lord Chief Justice said the premises being used as they were, and the persons employed being able to pass from one building to the other, and the process carried on being one process, the Court did not, under all the circumstances, consider that they could interfere with the umpire's finding. The other Judges concurred, and the appeal was dismissed.

NORWICH BUILDER'S FAILURE.—ESTIMATED SURPLUS.—*Re* Charlotte Porter (wife of Henry Earle Porter), residing at Park-lane, Norwich, rickmaker and building estate proprietress, carrying on business separately from her husband at Park-lane, at Sprawston Brick Works, School-lane, and Roman Hill Brick Works, Lowestoft. Gross liabilities £49,046 12s. 2d., estimated surplus £915 10s. 10d. The Official Receiver last week said he had received a medical certificate, stating that the debtor could not be present that day, and the examination was adjourned till the next Court.

RIGHTS OF OWNERS ADJOINING "OPEN SPACES."—*BOYCE V. THE PADDINGTON BOROUGH COUNCIL.*—his was an appeal heard last Saturday against the decision of Mr. Justice Buckley. The case was thus summarised in the judgment of the learned Judge: "When stripped of all technicality, the question to be determined in this action is whether the owners of land circumscribed and abutting upon other land which has become an open space within the Metropolitan Open Spaces Acts, 1877, 1881, and 1887, and the Disused Burial Grounds Act, 1884, became at once, by virtue of those Acts, or must be allowed to become, after the period of the Prescription Act, by the use of an enjoyment which cannot be excluded the erection of a hoarding, entitled as of right the access of light to the windows of any buildings which they may erect contiguous to the open space. The open space in question is the disused burial-ground of St. Mary's, Paddington. The plaintiff has recently erected a large block of premises immediately abutting upon that open space, with numerous windows overlooking it. The defendants contend that they are entitled to erect a hoarding or screen in front of those windows so as to preclude the plaintiff from prescribing for rights of light. The plaintiff says they are not so entitled, and asserts his case upon two grounds. He says, first, that he, as a member of the public, is entitled to insist that the space shall be an open space; from which it results that there will be free access of light to his windows; and, secondly, that

whether this is so or not, the defendants cannot erect a hoarding so as to prevent his becoming entitled by prescription, because they are by the relevant Acts of Parliament forbidden to erect any building, temporary or movable, except for the purpose of enlarging the church. A hoarding erected for the purpose of preventing the acquisition of a prescriptive right to light is, he says, a building. Under section 1 of the Metropolitan Open Spaces Act, 1877, an open space, when acquired under the Act, is to be held "in trust for the perpetual use thereof by the public for exercise and recreation." By section 4 of the Open Spaces Act, 1881, power is given to transfer any churchyard, or the control of it, within the metropolitan area, closed for burials, to the local authority "for the purpose of giving the public access" thereto and "preserving the same as an open space accessible to the public." And by section 5 the local authority is to hold and administer the property "in trust to allow, and with a view to, the enjoyment by the public of such open space, churchyard, cemetery, or burial-ground in an open condition free from buildings, and for no other purpose," and power is given to "inclose or keep the same inclosed with proper railings and gates." By section 3 of the Disused Burial Grounds Act, 1884, "it shall not be lawful to erect any buildings upon any disused burial-ground, except for the purpose of enlarging a church, chapel, meeting-house, or other place of worship." The freehold of the land is vested in the vicar. The defendants objected that the plaintiff could not maintain the action without the concurrence of the Attorney-General. Mr. Justice Buckley overruled this objection, holding that the plaintiff was claiming a private right distinct from the right which he had in common with the rest of the public. He claimed upon the footing that he had a right to the access of light to his windows, and, therefore, was suing in respect of a private, not a public, right. If, however, he was suing in respect of his right as a member of the public to say that no building should be put on the land, and the hoarding was a building, he would be personally suffering special damage from the breach of the public right, and could, therefore, sue without adjoining the Attorney-General. His Lordship, therefore, held that the action was well constituted; but he decided against the plaintiff on the ground that he had not the right which he claimed. His Lordship said that the Acts did not contemplate the creation of any consequential rights in the neighbouring owners. The space was to be opened for the public purposes for which it was to be enjoyed—viz., for exercise and recreation. It was not to be open so as to create rights in favour of adjoining landowners. The plaintiff's contention really was that he had a right which would be a private right, because there was another and a different public right. His Lordship was of opinion that a hoarding put up to prevent the plaintiff from acquiring prescriptive rights was not a building within the meaning of the Acts. His Lordship came to the conclusion that the plaintiff had not by virtue of the Acts acquired the easement which he claimed, and that the defendants were not by the Acts precluded from erecting such a hoarding as was necessary to prevent him from obtaining the benefit of the Prescription Act. The action was accordingly dismissed. The plaintiff appealed. The hearing of the appeal was begun on May 6th. Before the argument on behalf of the plaintiff had been concluded the Court intimated that it was desirable in the interests of peace, and having regard to the fact that the defendants are a public body, that the matter should be settled between the plaintiff and the borough council; and they suggested terms of settlement—viz., that the plaintiff should give an undertaking that he would not claim any prescriptive right to light by reason of the hoarding not being erected, and that the defendants should undertake not to erect the hoarding. The plaintiff was willing to give the undertaking proposed on his part, and the appeal was ordered to stand over for the purpose of ascertaining whether the borough council would be willing to give the undertaking proposed on their part. It afterwards appeared that the council were not prepared to give the proposed undertaking, and the appeal now came on again in order that the arguments might be concluded. Their Lordships having intimated that the Attorney-General ought to be made a party to the action in respect of the rights of the public, the Attorney-General authorised the use of his name, and the pleadings were amended accordingly, so as to make the Attorney-General, at the relation of Mr. Boyce, and Mr. Boyce co-plaintiffs. The Court allowed the appeal. Lord Justice Vaughan Williams said that the vicar as such took no part in the threat to erect a screen, and there was therefore no cause of action against him, and the action as against him must be dismissed. The order of the Court below giving him costs would not be altered; but, having regard to the position which he had taken up in the Court of Appeal, he would have no costs of the appeal. As regarded the borough council, their statement of defence contained the following passage:—"The action of the defendant council in threatening to

erect the said screen has been taken solely in performance of their public duty as trustees by virtue of the said Acts, and the sole purpose of erection was to prevent the plaintiff, as the owner or occupier of land adjoining the said churchyard, from acquiring any rights of light or air which would diminish or injuriously affect the enjoyment by the public of the said churchyard as an open space." His Lordship referred to the sections of the different Acts which are above mentioned, and said that in his opinion the council had no right to erect the screen for the purpose which they stated. To do so would be inconsistent with their duties under the statutes. They would be holding and administering the open space otherwise than with a view to its enjoyment by the public. Quite apart from the express prohibition of the erection of any buildings, his Lordship thought that the erection of the proposed screen did not come within the power or authority given to the council by the statutes. Moreover, his Lordship was not disposed to read the word "building" in the limited sense in which Mr. Justice Buckley had read it. An injunction must be granted to restrain the council from using the open space in any other manner than that which was specified in section 5 of the Act of 1881, and in particular from erecting a screen as was proposed, but this would not prevent the council from inclosing the space with proper railings and gates. The council would be relieved from paying costs in the Court below; but no costs would be given to them in that Court, and they must pay the plaintiff's costs of the appeal. Lord Justice Romer concurred. Lord Justice Cozens-Hardy also agreed. He did not base his judgment on the question whether the screen was or was not a "building." Under the statutes the council had control over the open space for strictly limited purposes, and it was not competent to them to use their powers for the purpose of compelling a neighbouring landowner to give them a right of way or preventing him from acquiring any rights.

BUILDING DISPUTE.—At Leeds Assizes on Monday, before Mr. Justice Grantham, John Hobson, joiner, of Domestic-street, Holbeck, Leeds, sued Joseph Hunt, of North Park-road, Roundhay, Leeds, for £113 10s., the balance of account for work done. Mr. Macaskie, in opening the case for the plaintiff, said his client was a builder who erected houses and then sold them, but who did not do contract work. In 1901 he bought a piece of land at North Park, Roundhay, intending to build a house for himself. The defendant, who was a friend of the plaintiff, had also a piece of ground immediately adjoining, on which he, too, intended to have a house built. He advertised for tenders, and asked the plaintiff to tender among the others, but, as this was not in Hobson's line, the latter declined. The tenders were higher than Hunt expected, and he again asked the plaintiff to tender. Eventually, as both houses were together, the plaintiff undertook to build Hunt's house at cost price. The question of the joinery work came up, and the plaintiff was asked to do it for the same sum as the lowest tender, £245, but this he refused, saying he would do it at cost price. The point at issue was whether the plaintiff had agreed to do the whole of the work at cost price, or whether, as the defendant alleged, he was to do the joinery work at the lowest tender, and any question of extras was to be left to the defendant's son to decide. The jury found for the plaintiff, holding that there was no contract, but that the plaintiff was not entitled to commission. The amount to be paid is to be decided elsewhere.

CHARING CROSS AND HAMFSTEAD RAILWAY.—Mr. H. T. Steward sat at the Surveyors' Institute, Westminster, on Tuesday to hear the case of "Ruffin v. the Charing Cross, Euston, and Hamstead Railway Co.," it being a claim for compensation for the compulsory acquisition of the claimant's interest in the premises, 74, Tottenham Court-road, required for the purposes of the new railway. Mr. Courthope Munroe appeared for the claimant, a lady carrying on the business of a pastrycook, and Mr. Roskill, K.C., represented the company. Mr. Munroe informed the arbitrator that his client had agreed to accept the sum of £1,500 in satisfaction of her claim. The arbitrator said he would make his award in accordance with the terms of the amount agreed on.

WOOLWICH ARSENAL EXTENSION.—At Westminster on Tuesday, before Mr. R. Clutton, sole arbitrator, a claim for compensation, amounting to £6,000, was heard against the Secretary of State for War, in respect of about 20 acres of land which the War Office have compulsorily acquired from a Mrs. Dashwood in connection with the extension of Woolwich Arsenal. Mr. Rawlinson, K.C., and Mr. Ricketts appeared for the claimant, and the Solicitor-General (Sir E. Carson, K.C., M.P.) and Mr. Sutton represented the War Office. Mr. Rawlinson stated that the land was a valuable building site, and was suitable for the erection of factories or workmen's dwellings. It had an area of 20 acres, and he put the value per acre at, roughly, £300. One plot was let on a yearly tenancy with other land for £25 a year. Expert witnesses called for the claimant put

the value of the property at figures ranging from £2,951 and £3,000 to £6,000. The Solicitor-General submitted that £150 per acre placed on the land by several of the witnesses was very much too high, and that it was wrong to place the same value on the two plots of land in question, one of which had a frontage and the other had not. The War Office experts called estimated the value at from about £1,590 to £1,650. The arbitrator reserved his award.

WATER SUPPLY AND SANITARY MATTERS.

HUGE DRAINAGE SCHEME.—The conservators of the River Lea have been much troubled with pollutions of a serious character, one of the chief causes being the sewage farms along the river valley. With a view to remove this difficulty, which forms a fertile source of danger to health, surveys and plans have been made showing how a joint drainage sewer of the various urban and other authorities would meet the object. Sir Alexander Binnie has approved of the proposal, and the conservators are asking the various local authorities concerned to adopt the scheme. It is a huge one, and the cost would no doubt run into seven figures; but so much Lea water is used by water companies that some action is necessary in the interest of public health.

WOLVERHAMPTON.—The annual report of Dr. Malet, the medical officer of health for Wolverhampton, just issued, states that the sanitary condition of the borough has in the past few years materially improved in several directions. Much unhealthy property has been closed; some of it has been demolished, leaving more open space; thousands of defects, each one, perhaps, trivial in itself, but contributing to the general air contamination, which is the essential unhealthy element in a town, have been remedied; many new and open streets have been built. All these things have rendered the town as a whole healthier, and the lower death rate is in part at least due to this. Much, however, remains to be done. In the eastern district there are very many houses so crowded in courts as to be unhealthy themselves, and by their obstruction to cause other houses to be also unhealthy. Much of the house property in the older parts is so badly constructed, or so worn out, as to need constant attention to keep it reasonably dry. Not a little of the house drainage throughout the town is seriously defective. It is doubtful if the water supply is sufficient. Some new streets have far too little back-air space. As to the directions in which sanitary work could more effectively be carried on, Dr. Malet instances the extension of the water supply, the provision of a destructor, the extension of the borough hospital for diphtheria and enteric fever, and the general assisted conversion of pail closets to water carriage under the provisional order.

At a meeting of the Royston Surveyor's Committee, on Monday, the tender of Mr. John Lewis, of Rochdale, for brickwork at the sewage outfall works was recommended for acceptance, and this the council approved. The tender of Messrs. Mather and Platt for automatic spreaders for sewage treatment was also approved, on the committee's recommendation.

The scheme for the erection of a Liverpool memorial to the Rev. Charles Garrett has now taken definite shape, and an appeal is being made for funds. On the site in Renshaw-street a central hall to seat 2,500 and a smaller hall to seat 750 are to be erected at a cost of £35,000. To the Boys' Home in Shaw-street, which forms part of the mission of which Mr. Garrett was superintendent, a night shelter and training home are to be added at a cost of £3,000.

The new lectern which the children of St. Mark's, Salisbury, have given to their church for their Lady-chapel is carved in walnut from designs by the architect, Mr. A. J. Reeve, and is noticeable as being of the unusual but correct form of a "reading pew," rather than a mere book-rest on a pedestal. The carving has been done by Mr. Noyes, of the cathedral choir, and the design is a cross in open panels, with a circlet about the arms.

The Lord Mayor of Sheffield, who recently refused to pay the education rate, on Monday objected to the employment of nude models at the Sheffield School of Art.

Alfred John Hartill, plumber and gasfitter, 4, Worcester-street, Wolverhampton, was examined at the Wolverhampton County-court on Monday, before Mr. Registrar Kettle. The liabilities were set down at £318, and the assets at £61. In answer to Mr. S. W. Page, the Official Receiver, he stated that in 1899 he executed a deed of assignment, the liabilities amounting to £897, and a dividend of 7s. 6d. in the pound was paid. He afterwards purchased some of the stock and recommenced business. He had been sued during the past twelve months, and had had about 20 executions. The examination was adjourned.

Our Office Table.

MESSRS. HART, SON, PEARD, and Co., Ltd., who, like ourselves, were not long since turned out of their old-established quarters by the Strand-Holborn improvement, have settled down in commodious quarters at 138-140, Charing Cross-road, where they still maintain their leading position as art-metal workers and wholesale, export, and manufacturing ironmongers. They have just issued an enlarged edition of section 7 of their illustrated catalogue, treating on builder ironmongery, corrected up to date, which is most usefully arranged, and embraces every possible requisite. As most of their old patrons know, the firm have a reputation second to none for quality and promptness, and are probably equalled by few for the comprehensiveness of their stock, embracing many "out of the way" specialities for which the architect and builder seek in vain elsewhere. Complete rearrangement in the new premises has greatly facilitated selection. In the department of purpose-made goods, having in their own factories a large staff of workmen experienced in the various branches—smiths, brass finishers, locksmiths, &c.—they are enabled to bestow great attention on, and to offer unusual advantages in, the prompt execution of orders intrusted to their care.

At the Langham Hotel on Wednesday, the Hon. Auberon Herbert gave an exhibition of the chipped or figure stones which he regards as the attempts of prehistoric races to picture themselves and their animals, and which were found in the New Forest, where, according to Mr. Herbert, the pits contain enormous masses of worked stones. He discerns in these stones representations of the features of two or three distinct human races. In one class the hair is trained high above the forehead, and in a second, which may either be another race or only a division of the preceding, it is trained straight back over the forehead, sometimes suggesting that a bit of the head has been cut off. A third class is quite different and more negro in type, with a low arrangement of the hair. Mr. Herbert even ventures to draw physiognomical deductions from the marks on the stones, though he admits that there may be a certain element of romance in his speculations concerning the characters of the different races. The first, for example, he thinks must have been strong, self-controlled, thoughtful, and gentle, keen and patient observers of nature, and appreciative of natural beauty. They were exceedingly tender with the stones, and never cut them unnecessarily, but selecting a suitable one for the purpose they had in view, with a few skilful touches they gave it the characteristics they required. In this respect they formed a contrast to the third race, who smashed and broke the stones according to their fancy. Mr. W. M. Newton also showed some specimens of the figure-stones he had collected in Kent and Dorset; these differed from Mr. Herbert's in being a good deal larger; but they, too, presented resemblances to human faces, birds, reptiles, &c., their owner having in some cases assisted the imagination of the observer by filling the hole which prehistoric man is supposed to have intended for an eye with a glass imitation of that organ.

Some examples recently added to the collection of ecclesiastical embroidery at South Kensington are now exhibited there in the Tapestry Court. They were obtained from the Hochon Collection, which was sold in Paris last month. The beautiful Italian orphrey, dating from the second half of the 14th century (No. 831-1903), is remarkable for fineness of workmanship and for the simple manner in which the artist has told the story of the Virgin Mary. The subject is represented in nine scenes, beginning with the rejection of Joachim's offering in the Temple, and ending with the Assumption of the Virgin. The orphrey probably belonged to a cope, and may be compared with that on the cope (No. 580-1884) exhibited in a wall-case in the Italian Court. An English orphrey (No. 827-1903) comes in no degree behind this Italian example in technical qualities, and forms another illustration of the remarkable pre-eminence of English embroideries in the earlier Gothic period. "Opus Anglicanum" had acquired a celebrity on the Continent of Europe before the middle of the 13th century, and beautiful examples dating from that and the following century, and showing unmistakable signs of English origin, are still to be found in

Italy, Spain, France, and elsewhere. The orphrey in question belongs to the close of the 13th century, and may be compared with the famous Syon Cope, and other less-known early English embroideries exhibited among the vestments adjoining the Italian Court. Part of another English orphrey, in two pieces (Nos. 828 and 829-1903), belongs to a slightly later period. Two complete chasubles were also acquired, one of green brocade (No. 830-1903), with French orphreys of the 15th century, embroidered with female saints, and the other of green velvet (No. 825-1903), with a fine Flemish orphrey of the early years of the 16th century, representing a Trec of Jesse. Two bands of Cologne work (Nos. 823 and 824-1903), illustrating the possibility of combining the weaver's and embroiderer's art, date from the latter part of the 15th century. One other piece may be mentioned, an orphrey from a chasuble (No. 826-1903) bearing the date 1526 on a cartouche beneath the central figure of David, and most probably of French workmanship. It forms a simple and useful example of Continental work at a period when the art of the embroiderer in this country, after a decline during the Wars of the Roses, shone again for a brief period before its practical extinction, as far as ecclesiastical work is concerned, at the dissolution of the monasteries.

Last week in Clifford's Inn Hall, Messrs. Farebrother, Ellis, and Co., auctioneers, who recently sold this ancient Inn of Chancery for £100,000, offered for disposal a set of 17th-century woodwork and carving ascribed to Grinling Gibbons, now fitted in a room at No. 9, Clifford's Inn, Fleet-street. This carving is of good design, consisting of a grand chimney-piece, finely carved with foliage and flowers, beautiful panelling with bolection moulding, and a chair rail. The first bid was 100gs., and at 550gs. it was purchased for the Victoria and Albert Museum.

The London County Council has ungraciously and unwisely adopted the recommendations of its Parks and Open Spaces Committee to refuse to hand over to the St. Pancras Borough Council, out of the funds belonging thereto in its hands, the sum necessary to purchase from Lord Dartmouth, the owner, the open spaces in the Highgate-road, which form so picturesque an approach to Parliament Fields. It would certainly be a calamity if these spaces were built upon or otherwise appropriated by the owner, as they very well may be, and the action of the L.C.C. is another curious instance of the perverseness of some Progressives. The borough council of St. Pancras is now about to consider the advisability of purchasing the spaces out of the local rates; but it is unfair that this burden should fall upon it while the London County Council retains far more than enough of the money paid over by the Midland Railway Company which was earmarked for such purposes.

At the last meeting before the recess of the London County Council on Tuesday, the Bridges Committee recommended that the standing orders of the Council limiting the period for considering applications to Parliament be suspended so far as necessary to enable the Council to consider the recommendation that powers be sought in the next session for the rebuilding of Lambeth Bridge. Lord Welby, after pointing out the heavy commitment on capital account, moved that the question be postponed. Alderman Evan Spicer said that the delay in rebuilding this bridge would cause a serious deterioration in the value of the surrounding land acquired in connection with the Westminster improvement. After a long discussion the subject was adjourned, on the ground that complete information had not been given. The Bridges Committee's recommendation, "That the estimate of £1,340,000 submitted by the Finance Committee for the construction of Rotherhithe tunnel be approved," was also postponed. The Piccadilly widening scheme was adopted by 55 votes to 36, the Westminster City Council agreeing to contribute one-fifth of the cost, provided that it does not exceed £40,000.

The annual Conference of the British Medical Association was opened on Tuesday at Swansea. Dr. Griffiths, the newly-elected president, said in his address that the Public Health Acts required improvement to keep pace with the great progress made in medicine and surgery. The appointment of medical officers in rural districts was generally very little better than a farce and a waste of public money. The reform needed was greater central authority and greater power for the county

councils. He advocated making the President of the Local Government Board a Secretary of State. One of the duties of medical officers of health should be to deliver popular lectures on sanitary questions and hygiene generally. The sanitarian motto should be "Educate."

THE Act providing for the work preparatory to the construction of the Charles River Dam, in Boston, Mass., has been passed by the Massachusetts Legislature, and the dredging out of the watercourses in the Fens, with the permanent exclusion from them, and from the Charles River basin, of all sewage, must, under the Act, be begun at once. The actual construction of the dam cannot be carried out, or even ordered, until the War Department at Washington has given its consent: but it is understood that this will not long be withheld, and the Act empowers the Commissioners in charge to complete the work as soon as a permission is obtained. The scheme, as adopted, provides for a high-level dam, which will shut out tide-water, making the Charles and its tributaries freshwater streams. The dam itself to be 100ft. wide, and is to be laid out as park; and the shores of the basin are also to be turned into parks. The present Charlesgate is to be reconstructed, and made artistically creditable to the city; and other changes will naturally follow from the establishment of a permanent high level in all the waters above the dam.

THE following have been appointed to survey the schools in the various union areas of the Essex Education Committee:—Chelmsford and Haverhill, 53 schools, J. B. H. Low, Chelmsford, £120; Stortford, Dunmow, Linton, Saffron Walden, 68 schools, J. Kennedy, Romford, £200; Braintree, Halstead, Rishbridge, and Sudbury, schools, J. W. Start, Colchester, £190; Lendend Tending, 70 schools, T. H. Baker, Colchester, £216 3s. 6d.; Maldon and Rochford, 60 schools, S. J. Adams, Southend, £189; Orsett and Romford, J. W. Dunford, Walthamstow, 14 2s. 3d.; Edmonton, Epping, Ongar, and East Ham, 57 schools, Horace White, Loughton, £30. Total fees, £1,159 5s. 9d.

It is not so very many years since the usual charge for building quantities stood at 2½ per cent. on the cost of the work, based on the accepted tender. Of late competition has brought the fee for quantity surveyors down to 1½ per cent., the now normal charge, and, provided the work is well done, this figure appears to be the most remunerative price, though some corporate bodies offer and only pay 1¼ per cent. For undertakings of large size where the work is very plain this may perhaps suffice; but in moderately-sized jobs thoroughly careful quantities certainly worth 1½ per cent., merely looking at the matter from a business point of view in the interests of the building owners. We see here and there cutting prices, however, occur. At Chelmsford the other day a well-known quantity surveyor in practice in the metropolis undertook the public library quantities at the rate of 1½ per cent. of the lowest tender, the amount of which, according to the resolution of the council, will not be accepted if it materially exceeds £10,000. Mr. H. T. Hare's design in the late competition was agreed to on the understanding that it should be carried out for not more than this amount. As the ground-floor rooms, however, will have to be increased in height by 2ft. to render them suitable for their purpose, the cost probably will proportionately, no doubt, be augmented; but even should the cost reach £14,000, the sum asserted as likely by one member of the council, the above-quoted percentage agreed to for the quantities will interest the majority of our readers, and will do no further comment.

On Saturday last an appeal was heard at the Middlesex County Hall, at Westminster, before Mr. J. L. L. and a fairly full bench of magistrates against the excessive assessments of a residential property at Haverhill. The house till quite lately was assessed at about £70. The owner recently purchased the house, rebuilt the stable, and increased the size of one bay, adding a small porch. The actual contents of the house was not materially increased. She decorated the interior, however, somewhat expensively, and the overseers put up her assessment to £177. She appealed at Brentford and induced the Bench there to reduce the rateable charge to £145 or £147. The Brentford judgment was based seemingly on the basis of what the owner had paid for the property, and the cost of her late so-called improvements, she being the owner in residence. On the appeal above referred to, Mr. Littler said that any consideration

of cost was wrong, as the magistrates had only to do with the rental value, taken not as an outside price, but as a likely amount at which the property could be let. The judgment of the Westminster Court was that the appellant's case would be granted, the gross value being determined at £120, the rateable value to be £102 per annum. This verdict was accompanied, strangely enough, by a recommendation to the overseers that similar properties in the neighbourhood should, in justice to the lady in question, be increased *pro rata*. This rider to a case settled on its merits appears to be quite beyond the province of the Bench, who had no other question of assessment before them at the time. This suggestion to the overseers was made in the absence of the owners of the properties referred to, who thus were unable to defend themselves from wholesale impositions of this character, and thus we can but consider the proposal uncalled for and quite out of order.

A CONTRACT has been signed whereby the Pantreiniog Quarry, Bethesda, will be taken over as a going concern on Aug. 1 by a newly-formed co-operative company registered as the North Wales Quarries, Ltd. The other two quarries proposed to be acquired will be taken over on Sept. 1. Mr. W. J. Parry, the defendant in the late Penrhyn libel action, will join the board of directors on Aug. 8, and be retained as managing director. The continuity of managerial policy will thus be maintained.

At the Court of Common Council last week a memorial was presented by the Vestry of St. Giles's, Cripplegate, inviting the Corporation to render assistance towards the improvement in that locality, by which the fine old church may be open to view from the street, and a site, within an open space, acquired for the erection of a statue to John Milton, who is buried there. The Ecclesiastical Commissioners had purchased for £1,400 a part of the necessary land for this object, and the vestry had agreed to give £1,500 to the Corporation for the remaining portion. The expenses of converting the site into an open space and other incidental matters would cost £3,500, towards which the inhabitants were prepared to contribute handsomely. The church was the burial place of Martin Frobisher, the navigator, John Speed, the historian, and John Foxe, the martyrologist, and Milton; Oliver Cromwell was married there, and it contained some of the finest monuments in the City. The memorial was referred to the Finance Committee for consideration.

Murthly, Perth—Detached Villa at Asylum	Edward McGuinness	David Smart, Architect, Perth	3
East Kilbride—Cemetery Works	C. Edwards's Brewery, Ltd.	J. Cowan, A.M.I.C.E., 179, West George-street, Glasgow	3
Cross Keys, Mon.—Fifteen Houses at Watts-Ville	L. & N.W. and G.W. Jt. Railways	R. J. Strong, United National Collieries, Cross Keys, Mon.	3
Ludgershall—Alterations to Police Residence	Miss Sinkinson	C. S. Adye, County Surveyor, County Offices, Trowbridge	3
Distington—Enlarging Dyon School	North-Eastern Railway Co.	H. Hill, Dyon Side, Distington	3
Glasgow—Passenger Station at Plein Junction	Jambeth Guardians	The Company's Divisional Engineer, 16, Killermont-street, Glasgow	3
King's Lynn—Warehouse, Page Stair-lane	Electricity and Tramways Committee	H. Tilson, Architect, Railway-road, Lynn	4
Cardiff—Playground Extension and Verandah at School	North Eastern Railway Co.	G. Thomas, Architect, Queen's Chambers, Cardiff	4
Gilwern—Additions to Coin Exchange Inn	Guardians	R. J. Francis, Architect, Abergavenny	4
Brickfield Gardens, N.E.—Bandstand, Conveniences, &c.	Urban District Council	The Housing Section, Archt.'s Dept., 18, Pall Mall East, S.W.	4
Cardiff—Alterations to No. 29, The Parade	Trinity Corporation	G. Thomas, Architect, Queen's Chambers, Cardiff	4
Londonderry—Rebuilding Business Premises, Bishop-street	Bersham School Board	J. P. McGrath, Architect, Foyle-street, Londonderry	4
Gilwern—Nine-stall Stable at Navigation Inn	Management Committee	B. J. Francis, Architect, Abergavenny	4
Northwich—Gospel Union Mission-Hall	English Wesleyans	E. T. Ward, Warrington-street, Northwich	4
Shrewsbury—Railway Station	Churchwardens	A. E. Bolter, Sec. to Joint Committee, Paddington Station, W.	4
Bowdens-on-Windermere—Residence	Urban District Council	John F. Curwen, F.R.I.B.A., 26, Highgate, Kendal	4
Sleights, Yorks—Three Cottages	H.M. Commissioners of Works	William Bell, Architect, York	5
Barrow-in-Furness—Central Hall, Hartington-street	Benwell and Fenham U.D.C.	John F. Curwen, F.R.I.B.A., 26, Highgate, Kendal	5
Lambeth, S.E.—Repairs, &c., to Workhouse, Renfrew-road	School Managers	W. Thurnall, Clerk, Brook-street, Kennington-road, S.E.	5
Warrington—Concrete Foundation	Admiralty	The Borough Electrical Engineer, Hensley, Warrington	5
Penshaw—Station Buildings	Standing Joint Committee	William Bell, Architect, Central Station, Newcastle-on-Tyne	5
Limerick—Concrete Floor, &c., at Male Probationary Ward	Guardians	The Engineer, 10, Glentworth-street, Limerick	5
St. Apes—Offices and Additions to Residence	Urban District Council	Sampson Hill, Architect, Green-lane, Redruth	6
Waterloo—Park Shelter and Tool-House, Victoria Park	Trinity Corporation	F. Spencer Yates, A.M.I.C.E., Surveyor, Town Hall, Waterloo	6
Portland Bill, Dorset—Lighthouse Dwellings	Bersham School Board	Corderoy, Selby, and Corderoy, 21, Queen Anne's Gate, S.W.	6
Robostyle—School (100 places)	Management Committee	T. Morris, Architect, 7, Argyle-street, Wrexham	6
Aragh—Alterations to Dormitories	English Wesleyans	R. H. Dorman, County Architect, Asylum, Armagh	6
Yoxby—Chapel	Churchwardens	Arthur O. Evans, Pontypriid	6
Baile, Downpatrick—Vestry and Porch to Church	Urban District Council	The Rectory, Baile, near Downpatrick	6
Seaforth—Park Shelter and Bowl-House, Bowensdale Park	H.M. Commissioners of Works	F. Spencer Yates, A.M.I.C.E., Surveyor, Town Hall, Waterloo	6
Bargate, Grimsby—Residence	Benwell and Fenham U.D.C.	Herbert C. Scapion, Architect, Court Chambers, Grimsby	7
Thornton Heath—Sorting Office	School Managers	The Secretary, H.M. Office of Works, Storey's Gate, S.W.	7
Scotwood—Improvements to Gibson and Co.'s Works	Admiralty	W. P. Pattison, Surveyor, Council Offices, Benwell	7
Ashford—Repairs to School Roofing	Standing Joint Committee	F. G. Beeching, Clerk to Managers, Ashford, Middlesex	7
Embleton—Wesleyan Chapel and School	Guardians	J. Allison, Bassethwaite Lake Station, Embleton	7
Cemaes, Anglesea—Coastguard Station	H.M. Commissioners of Works	The Director of Works, Admiralty, Northumberland-avenue, W.C.	7
Faversham—Police Station, Cottages, &c.	Rural District Council	The County Surveyor, 86, Week-street, Maidstone	7
Brigden—Infirmary at Workhouse	J. Samuel Spry	P. J. Thomas, Architect, Bridgend	7
Crewe—Post Office	Grove Estate Building Club	The Secretary, H.M. Office of Works, Storey's Gate, S.W.	7
Ulverston—Additions to Cottage Hospital	Prescott's Bank, Ltd.	J. W. Grady and Son, Architects, Brodgen-street, Ulverston	8
Londonderry—Cottages	Rev. L. P. Williams	J. J. S. Barnhill, Engineer, 1A, Strand, Londonderry	8
Fermy—Residence	Trustees	W. H. Hill and Son, Architects, 28, South Mall, Cork	8
Gwinear—Farm Buildings	Corporation	Sampson Hill, Architect, Green-lane, Redruth	9
Pontnewydd—Forty Houses	Guardians	Fisher and Sons, Architects, Club Chambers, Pontypool	10
Exeter—New Building at City Bank	Corporation	E. H. Harbottle and Son, Architects, County Chambers, Exeter	10
Sunderland—St. Mary's Vicarage, Tyne Dock	Heckney Union Guardians	Joseph Potts and Sons, Architects, 57, John-street, Sunderland	10
Edwardsville, near Tre-harris—Vestry	Corporation	W. Dowdeswell, Architect, Bryntaff, Treharris, R.S.O.	10
Glasgow—Extension of Workshops	Corporation	Stclair and Ballantyne, Architects, 95, Bath-street, Glasgow	11
Aylesbury—Various Repairs at Union House	Corporation	F. B. Parrott, Clerk, 16, Bourne-street, Aylesbury	11
Bacup—Infants' School, Lane-head-lane	Corporation	Smith and Cross, Architects, Town Hall Chambers, Rochdale	11
Homerton, N.E.—Scully at Sydney-road Workhouse	Corporation	W. A. Finch, Architect, 76, Finsbury-pavement, E.C.	11
Glasgow—Tunnings, Bridgegate and St. Margaret's-place	School Board	The City Engineer, 64, Cochrane-street, Glasgow	11
Eskdale—Farm Buildings, Longrigg Green Estate	John Ainley and Sons, Ltd.	The Clerk of Works, Gatehouse, Eskdale	11
Penrith—Boy's School	Urban District Council	G. A. Birkenhead, M.S.A., Caledonian Chambers, Cardiff	11
Penrith—Stabling, &c., at George Inn	Corporation	J. Berry, Architect, 3, Market-place, Huddersfield	11
Epsom—Stables &c., at Sewage Farm	Trustees	Edward R. Capon, Surveyor, Bromley Hurst, Epsom	11
Northampton—Carpenter's Workshops, &c.	Urban District Council	A. Fidler, A.M.I.C.E., Borough Eng., Guildhall, Northampton	11
Kidwelly, Wales—Alterations to Calvinistic Methodist Chapel	Corporation	Anthony and Sons, Anchor House, Kidwelly	11
Epsom—Depot, Church-street	H.M. Commissioners of Works	Edward R. Capon, Surveyor, Council Offices, Bromley Hurst, Epsom	11
Northampton—Power Station Buildings	L.C.C. Asylums Committee	A. Fidler, A.M.I.C.E., Borough Eng., Guildhall, Northampton	11
Newchurch—Rebuilding Church	Urban District Council	Travers and Ramsden, Architects, 44, Church-st., Leigh, Lancashire	11
Hford—Post Office	Urban District Council	J. Wager, H.M. Office of Works, Storey's Gate, S.W.	11
Llandilofawr—Organ Chamber at Parish Church	Urban District Council	David Jenkins, F.R.I.B.A., Architect, Llandilofawr	11
Epsom—Long Grove Asylum Foundations	King's Norton Union Guardians	The Clerk, Asylums Committee, 6, Waterloo-place, S.W.	11
Colwyn Bay—Isolation Hospital	Merthyr Tydfil School Board	Wm. Jones, A.M.I.C.E., Station-road, Colwyn Bay	11
Selly Oak—Boiler-House at Workhouse	H.M. Commissioners of Works	C. Whitwell and Son, Architects, Temple-row, Birmingham	11
Troedyrhiv—Boys' School (60 places)	Docks Committee	J. Llewellyn Smith, Architect, Aberdare	11
Leicester—Enlargement of Head Post Office	Maldens and Coombe U.D.C.	The Secretary, H.M. Office of Works, Storey's Gate, S.W.	11
Bristol—Tobacco Warehouse	University of Wales	W. W. Squire, Engineer, Cumberland-road, Bristol	11
New Malton—Public Offices, Fire Station, &c.	Phoenix Brewery Co., Ltd.	Wm. Hope, Architect, Seymour-road, Hampton Wick	11
Cardiff—Registry Offices	School Board	Ivor James, Registrar, Brecon	11
Gildersome—Wesleyan Sunday Schools		Garside and Pennington, Architects, Pontefract	11
Bury—Offices at Green-lane Brewery		Wm. E. Gill, Architect, Derby Chambers, Fleet-street, Bury, Lancs	11
Dronfield—Warehouse and Offices		Gibbs and Flockton, Architects, 15, St. James-row, Sheffield	11
Wombwell—School		J. Robinson, Architect, Park Cottage, Wombwell	11
Heywood—Alterations at Advertiser Office		Wm. E. Gill, Architect, Fleet-street, Bury, Lancs	11

THE BUILDING NEWS

AND ENGINEERING JOURNAL.

VOL. LXXXV.—No. 2535.

FRIDAY, AUGUST 7, 1903.

IDEAL AND PRACTICAL ART.

IN all branches of professional activity, teaching and practice are often strongly divided. Men who set up as teachers place an ideal, not to say unattainable, standard before them which is seldom followed by their practical brethren. We presume this disparity between teaching and practice, or theory and practice, will always exist, and perhaps it is better that a high standard of art and practice should be aimed at. In the architectural vocation we find this dual mode of existence very prominent. We find men either, from accident or conviction, become teachers or theorists, and remain so all their lives; they never settle down to business in a thoroughgoing way. Others seem to find their vocation directly; they enter at once into the demands of business, placing their art in almost a subsidiary position, and never allowing it to completely control their allegiance. Business, and not art, is the watchword; but with the others—the theorists—it is not that which takes the trade or the public, or which appeals to the practical man, that is considered so much as some ideal property or quality that appeals to some higher sense or standard. In building construction we find very good theories held which will not work. The idea may be excellent and perfectly scientific, but it cannot be easily carried out or applied. Ordinary conditions do not favour it, so the more practical scheme comes to the front. The same distinction is very noticeable in architectural design; idealist and practical schemes are strongly in evidence. The exhibitions of students' designs and work are emphatic evidences of the two classes of minds. Whether we look at the students' work at the Royal Academy, the designs submitted yearly for the Institute prizes and medals, or those which are yearly exhibited at Kensington from students of our Schools of Art, the distinction between the two classes is very obvious. To some extent the work done in all these institutions is academical, and so far it is exempted from practical conditions. The subjects chosen for these competitions are given as exercises of the students' skill in design and composition and drawing rather than as designs for buildings to be carried into execution. Although this consideration ought not to weigh much with the authorities, we know very well that it has an influence over the designers. The design of a building which remains on paper, and is intended to appeal to the minds of examiners, is very different to the design of a building that is to be realised in bricks and mortar, and which will have to go through the ordeal of critical eyes of a committee, members of which are trying to pick holes; of quantity surveyors, who like to improve the drawings and specifications; of engineers and experts, glad to suggest and criticise, or to find easier methods of doing the work; and lastly, the public, who are ever ready to find fault. It must be remembered, therefore, that the academical design can be taken mainly as something that is possible in favourable conditions only; it represents the student's unrestricted imagination, and his power of expressing the ideal. It favours, of course, the architectural skill of the designer, his artistic power to give expression to the idea, and to this content the exhibition of designs of students is valuable, and must always have a place in our architectural system of education. The

youthful pupil is naturally ready and enthusiastic to exhibit his art talent as a designer or as a draughtsman; he spares no trouble and time in looking up examples in studying the best plans, bringing to his task all the natural talent of which he is capable, but impatient of all limitations and practical conditions. A genius in art is generally incapable of submitting to the practical or irksome details of his calling; anything which impedes the flow of his imagination, which restricts his fancy, is distasteful and quite antagonistic to success. But students of this sort have naturally an easy victory compared with those who are beset at every step with conditions and limitations. They can adopt a faultless ideal type of plan to work upon without any trouble as to boundaries of site, "ancient lights," and what not, and they are free to adopt a style in most cases which they are masters of, and which they can use to the best advantage. On the contrary, the student or architect under limitations that cannot be ignored, such as shape of site, ancient lights, contour and levels of ground, local by-law restrictions, and the necessities imposed by the owner, has all these things to fight against and overcome before he can consider his design. Yet it is perfectly true that genius is often invoked by these difficulties; in the overcoming of an obstacle the architect may hit upon a mode or a plan which has all the distinction of a stroke of genius, and which in ordinary circumstances would not have been conjured up. The difficulties of a plan—e.g., the ingenuity necessary in forming a large area at the crossing of a church, or the necessity of keeping a building low not to obstruct an ancient light—have all been instrumental in turning what may have been commonplace buildings into designs of much skill and beauty. In fact, invention has often been the incentive to the production of our greatest buildings. Every architect knows how often a change of plan to suit some urgent want has suggested a feature of value in his design. So it is that the greatest masters of architectural design and planning are indebted to the very problems they have had to solve. Thus the designer of buildings to be actually carried out, though with limited scope, may win the highest achievement, and show himself to be the greater artist than he who has everything easy before him. Which is the greater performance—that which is accomplished without any difficulties, or that which has surmounted them? This is a question which ought to be present in the mind of those who have to examine designs and award merit. The Liverpool Cathedral competition in its first stage supplied us with an example. A few ideal schemes were sent in which could have been carried out on any site; the authors had not studied the obstacles presented by the narrowness of the area, the necessity for a large area at the crossing. The designs subsequently submitted showed a closer study of the problem, and in two or three of the plans the authors have skilfully made a large crossing, or introduced features, as in the selected design, that undoubtedly indicate invention and resource.

There are certain peculiarities to be noticed in the academical or ideal design. The author has generally an ambition which is almost boundless, and his one aim is to gratify. He has always an exaggerated idea of his work. If it is a church it must be cathedral-like in scale and pretension; it must have a central tower, if not two others at the west end, or a domical feature; the plain prose of a parish church is rejected for the epic form. The academical design is nothing if it is not heroic in idea and scale; it must be after the model of a palace or some stately civic building in its details and sculptural embellishment. The author seeks to suggest the monumental or festive character rather

than the utile purpose of the building. In the decorative adjuncts the designer gives himself up to a free and spontaneous imagination. The "play impulse" is strong. Exaggerated scale in the parts, such as large porticoes, flights of steps and halls, palatial staircases, great domes and massive towers, sculpture-crowned pavilions are the elements of his composition. The unit of the human figure in the proportions is lost sight of, for the edifice looks more suited to a race of giants than men of ordinary stature. And the idea of use and occupation is lost also, for we see little attention paid to ordinary details and requirements of practical life. The formal or Classic styles, those in which regularity and symmetrical arrangements are common, are the most favoured by the ideal school, though there are others who go in for the Romantic, who like to revel in Mediæval churches and civic edifices, gate-houses and fortresses, and the picturesque combinations of old-world cities. In all these attempts there is little or nothing of the practical. Material and technic qualities are absent. Stone and brick are treated in much the same manner; often there is no indication of material or texture in the design; surfaces of wall are shown as if they were quite smooth, without light and shade or effects of tone. In the plans the attempt to make an imposing effect is often thrown away. Where the public frequent, the building should testify the fact. The ample entrance and approaches are necessary in those where large receptions are held, as in town halls and hotels; a court is a feature that should not be disregarded. The French are clever in the provision of the "cour d'honneur," as we see in the Louis XV. "hotels," and this court was generally towards the street, as we find in many of the hotels in Paris. Some of these palatial edifices had also well-arranged gardens in the rear, to which the reception-rooms opened. The quadrangle plan is one which admits of imposing effect, but the ordinary designer of prize designs is seldom equal to the task of arranging a plan that will be useful as well as beautiful.

The academical and the imaginative elements are predominant in all ideal designs. Mr. Herbert Spencer, in his "Principles of Psychology," refers to the "play" impulse, or free energy, found in the æsthetic sentiments based on the nervous system. We see it in the primitive kinds of implements in the ornament; in the higher forms of art we see the play impulse dominated by the principle of order, comprising such manifestations as rhythm, measure, proportion, and other modes of arrangement which make up composition. Professor Baldwin Brown notes the festal character of early architecture shown in the Egyptian temple—how little these vast structures were utilitarian in origin, how much was designed, carried out, and adorned in the mood of "play." The plan arranged on an axis of a great rectangle, with the great portal opening into a colonnaded court, thence through pillared halls to a small shrine which contained the symbols of the deity. Avenue, portal, colonnaded court, and pillared hall were designed to lead up to this part of the temple proper, and intended to impress the mind of the beholder. The Greek temple was also a like embodiment of the same mood. The colonnades were made to surround the shrine itself; the root idea was the same—an imposing realisation of the religious festival. The same festal character is apparent—the art of free and spontaneous expression. In a diagram or table of the beginnings of the arts of form, the same author describes the motive power of artistic production as the "free and spontaneous activities, not artistic"—viz., modes of expression under excitement by voice and gesture. These are common to all uncivilised races. Adornment seems to have had a social

origin, while "monument-making" springs out of those habits and feelings which have given to the festival its importance. The utilitarian element in architecture is not found in the other arts of the drama, painting, or sculpture. But we need not trace this table further. All it is intended to show is that art is a free exercise under excitement, but must be controlled. The festal structure made imposing becomes the architectural monument, and round this the decorative arts threw a veil of beautiful imagery. Ideal devices were the objects to be achieved. The principle of order or proportion, if we like to term it, came into notice—an instinct of human nature by which material is moulded into an artistic form. The work of art, whether a building or otherwise, must present itself as a unity, not as a mere formless conglomeration. In architecture of the higher forms, as in the monument, this law of unity is predominant in all the elements which go under the name of "composition." Let us look at the application of these principles. With the student the "free and spontaneous expression" or the "play impulse" is strong, and he naturally resorts to the festal expression—to those precedents of art which represent it. On the other hand, the practical designer subordinates his idea to the utilitarian. The controlling factors of requirements, materials, workmanship exercise a powerful influence on the design. One of the elements of effect in architecture is mass; and the architectural design which is mainly a composition of masses is often imposing. The heroic or grand building has its large and noble portal or entrance, the windows are large, the steps of a great flight are even made to the eye larger by wide treads, columns of great height and size are employed, and even features like balustrades are made to give an impression of magnitude. But in the everyday building the architect has to sacrifice these elements of effect and grandeur. The entrance cannot be made too large, the windows need not be more than sufficient to admit light, the steps must be neither too numerous nor too large for everyday use, the "measure of a man" being the standard to which all the parts should conform. The architect, in short, must adjust his building to its use and the mode of occupation. Now, the ideal design for public offices very often fails in these requirements. The large and ponderous portico and flight of steps are conceived on a heroic scale that dwarfs all the other parts.

The hall and staircase are unnecessarily large and spacious, and contrast with the smaller apartments, and the whole scheme is more suited as a palace of the Legislature than for the municipal requirements. Numberless designs that are submitted yearly in competition show these characteristics. Practical conditions, such as those imposed by site, materials, building regulations, workmanship, are all absent. But the question we have raised touches primarily the early instruction of the student. The failure of much of the architectural education is the precedence given to academical studies, which so generally absorb all his time and attention. If the pupil, after completing his school education, could enter a course of instruction like that recommended by the Architectural Association, much could be done to check the tendency to take up academical studies at the cost of all others. A systematic teaching course—say, two days a week—supplementary to the practical work of the office is the right plan. The Association have at length pursued this course, and the non-academical character of their programme is helpful in retaining a youthful interest in office and everyday practice. The continuation of the "actual" with "theoretical" studies is absolutely necessary to the profession in the earlier days of the career, or a warp of mind is contracted that is very difficult to overcome.

DECORATIVE DESIGNS AT SOUTH KENSINGTON.

MODELLING occupies a high place in design, and too much importance can hardly be given to it. A modelled design exercises faculties of the mind and imagination which a design on a simple plane surface does not; it is really designing in relief, a very important part of the architect's training. The examiners, T. Brock, R.A., G. J. Frampton, R.A., and T. G. Jackson, R.A., of the designs at the Victoria and Albert Museum, regret that there is no improvement in the quality of the work. They recommend greater attention to construction, that more care should be bestowed upon the architectural setting where the design is to form part of an architectural scheme, and they suggest that students should submit small-sized modelled sketches to explain the purpose of the work. Very good suggestions; but they can only be satisfactorily realised when the modeller is again taught to model on the building, when the architect gives more attention and thought to the modelled effect of his work, and studies design in the solid and is not so contented with drawing on paper. There are not many designs in this stage. Ernest G. Webb, Plymouth, has a silver medal for overdoor with four panels having emblematic figure subjects representing Commerce, Science, Art, Technology. The design is certainly clever; there is a grasp of the subject; the square panels are well filled, but the architectural details might certainly be better. John D. Revel, Dundee, has a design for a frieze well modelled; the frieze is coved, and in the coving grouped owls are introduced. The bronze prize is awarded to Charles W. Sharpe, Liverpool, for the base of a column; the figures are well modelled, but scarcely in the true position. A Liverpool student, Violet E. Brunton, is awarded a bronze medal for a sundial of refined outline and details. The figures, in a stooping posture under the cap, are well modelled, and represent Night and Morning on opposite sides of pedestal. Stone or bronze is suggested. The design is worthy of a higher prize. Herbert G. Beal, Plymouth, has a book prize for designs for tiles, but the plants and birds are not well modelled, and the student has failed to catch the right motive of the plant growth. A model for a wall fountain by Maggie Richardson, New Cross, we have seen before. It is decidedly original and clever in the general design and detail of basin with the modelled figures. It takes a bronze medal. A modelled figure from the nude, also awarded a bronze medal, is by Henry Green, West Bromwich. A silver medal is given to Annie McLeish, Liverpool, for a modelled design for a panel showing good arrangement, and to Annie C. Brown, New Cross, for clever model from cast of figures in relief. From the living model, the gold medal is awarded to Fred Halmson, New Cross, for a figure of a girl from the nude, well balanced and graceful in pose, with one hand on the head and the left extended. Two or three other models, one by H. Miller, of New Cross, for the same subject are exhibited. The drawing and painting from the living model are not up to the usual standard—a fact that has been pointed out by the examiners. This is the case with the full-length drawings of figures exhibited. The silver medal is given to Thomas C. Derrick, Bristol, for a well-balanced figure, well studied; and also to Herbert Budd, Hanley, for a careful study of figure. We also notice the drawings of details of the human figure, and a silver medal is awarded to J. Wilson Baxter, Carlisle, for drawings of hands and feet from life excellently drawn. Gilbert Rogers, Liverpool, has a well-studied oil-painting from the nude figure (bronze medal). A drawing of hands and feet in red crayon may also be mentioned. The Time studies are

interesting. We notice the modelling from life of heads; capitals for pilasters with foliage; design for a ceramic mosaic border; a clock-case; for a common seal, &c. Silver medals are awarded to Gilbert Rogers, Liverpool, and Albert W. Dodd, of the same place, for very able drawings in this useful branch of art training, which tests the individual power of the students. A good standard of excellence has been attained.

In the designs for furniture, decoration, stained glass, and metal the general level of the work in the exhibition at South Kensington is creditable, though we do not see many designs of high excellence. There is, as the examiners say, a "striving towards eccentricity for eccentricity's sake." Often this questionable quality is mistaken for originality. One of the best designs for furniture is by a Camberwell student, Hubert Martin, who obtains a silver medal for a lady's writing-cabinet, in which the lines are suggested by the construction instead of being dictated by mere fancy, as in the work based on the L'Art Nouveau style. The cabinet is well adapted for its purpose, and is refined in detail. The design is accompanied by an executed piece of furniture. A jewel-casket in coloured gesso, by Ernest E. Clark, Derby, may also be mentioned, which takes the same medal. The treatment of the gesso ornament and the colour are restrained. Gladys M. Baly, Regent-street (Polytechnic), is the recipient of the same prize for an overmantel with incised and stained wood panels, which has a freshness of treatment, though the wood is rather dark and there is a lack of coherence in the composition. The designs for bellows are clever. One of these takes the silver medal, by Edward Scott, Bradford Technical College, which shows a skilful adaptation of material and good outline. The second design, by John W. Wilkinson, Lancaster, of repoussé copper, is, in our opinion, worthy of the same prize. There is a commonsense constructional treatment, and the outline and detail are clever. We hope to illustrate this and other designs shortly. Geraldine Morris, Birmingham, takes a silver medal for a design for a piano front and an overmantel. The panels for the piano front represent poetical themes, in which the figures introduced are of the Burne-Jones type, but the colouring is rather hard and bright. The frieze by Arthur Paul has a series of winged figures or angels with foliage. The arrangement is bold. George Mason's design for a stencilled hanging is rather dark in the ground, but the design is bold; it receives a silver medal. Jessie Lacon, Birmingham, takes the prize also for a stained wood piano front of decided merit, and the specimens worked exhibit artistic skill. We have spoken of Herbert Budd's pottery panels for a fireplace as exhibiting a true conception of design for decorative panels in woodwork. Charles E. Connor's (Hanley) designs for pottery panels for wardrobe and music cabinet are broadly treated, and display a decorative feeling; the panel of "Music" is admirable. A book prize is given for J. Skinner's design for dado tiles in raised line majolica. A design for a nursery overmantel by Louise R. Jacobs, Hull, we have also mentioned in the silver medal works. Miss Jacobs has certainly given evidence of a true decorative conception in the arrangement of dancing maidens and refinement of colour. Clara Lavington, Leeds, shows some clever designs based on a flowering plant in monochrome, polychrome, and two colours, for which this medal is awarded, and Austin O. Spare, Lambeth, also takes the prize for designs for figure compositions showing invention. Amongst the bronze medal designs we notice several of a decorative character: a painted plaque by Janet Simpson, Hanley; for a pottery corbel by G. Brain, which is clever but poor in the detail; for stencilled decoration by James MacVicar Munro, Heywood; for a piano

front by Lilian Archer, Hornsey; for enamelled Limoges panels; for silver brooches, clasps, pendants; for stencilled friezes; for book illustrations; for a ball-room frieze, composed of figures of youths and maidens dancing, by Winifred Stamp, Regent-street, a design we have seen before; for an altar cross by Maggie Richardson, New Cross, containing the Crucifixion and four enamel subjects in the four corners of arms, a design of some originality; and for a wall-fountain (modelled); for a triptych and holy water-vessel by Josephine Riverstone, New Cross; and for a clock-case by Abbott Newbury Trent, West Ham, of some merit in design. These are all works exhibiting in many cases skilful adaptation of material with artistic skill in detail. Amongst those designs which have received book prizes we find some that are worthy of higher recognition in design or workmanship taken individually. Thus, the designs for bath-room tiles, by Minna Beck, Hanley; the modelled design for embossed wall-filling, by Walter Potts, Glossop; a design for gesso panel, by Ethel Bannister, Hull, indicate thought; and there are some good designs for wall panels by other students. Designs for nursery decoration, by Eugenie Richards, Nottingham, and the ink sketches of figure subjects for nursery books for children are decidedly clever and bright. The designs for colour prints we shall illustrate. Wall tiles are indicative of an improvement. The examiners' "note" observes that a number of the designs for tiles have been rejected because no colours are shown. They also "deprecate the repetition of the same design in identical spaces of the ornament in cases where the design is pictorial and is not connected with the ornament. In proportion as the design becomes more pictorial, the monotony of repetition becomes more apparent." They call attention to a design for wall tiles by John O'Neill Blair, Belfast, for which a bronze medal is awarded, where the figure of the animal is "well treated, becoming a duly subordinated feature of the ornamental design." The design of pottery panels for furniture is an excellent subject, though very few designs are submitted. The best are those of Charles E. E. Connor, already mentioned. A book prize is given to James W. Blackburn, of Huddersfield, for tiles, which represent boldness and quaintness of conception. David H. Hodge, of Plymouth, also has a good design. In this connection we may refer to the studies of historic styles of ornament which are valuable examples for imitation, so far, indeed, as we can recommend the reproduction of old designs. Among the works we notice Gladys M. Baly's studies of old armour, which receive a book prize, the examples of armoured horse, &c., being from the Tower of London. We shall illustrate this soon. The designs for door furniture, finger-plates, escutcheons are not numerous. Joseph B. Petch is awarded a book prize for his work in brass, which is sensible in design and treatment. Violet E. Brunton, Liverpool, receives the prize for a memorial tablet. The design is simple in character and refined in detail; no excess of meaningless ornament being attempted. The design for a processional cross and the details and executed work by Ester E. Tatlow, Wolverhampton, are of merit. The cross is in copper, gilt, silver, and enamel, the ornament of Greek design, and the work exhibits knowledge and taste. Near it Harold Olive Catt, Woolwich, exhibits design for a chalice and paten on silver and enamels, chaste in outline. Charles Hughes, Tottenham, receives a bronze medal for a copper and silver plaque which is designed in a manner suitable for its material and use; and in *repoussé* we note Arthur Penny's (Camden) design for an iron dish, which also is adapted, and is simply and quietly treated in *repoussé*. On the whole the

designs for metal work and jewelry display an advance on previous work. The material has been better adapted to the requirements, and the ornament designed on right principles. But in ironwork we notice very little that is good. The examiners regret the fact in view of the importance of ironwork. We cannot understand why so little attention has been given the electric light standards, which certainly opens a wide field for design. The designs sent are below the average in design, and the designs for gates are of much less merit than we have seen before. In other branches, too, as in pottery, the standard of excellence in design is not so high. The silver medal design for a sgraffito plaque, by Margaret Annie Smith, we briefly noticed last week, is certainly an exception. The lines of the centre figures and the flowing cloudlike emanations are exceedingly refined and subtle in grace and motion, and we may notice also Rosalind Fouracre's (Plymouth) design for a plaque in sgraffito for the taste of the design in the masses and detail. We referred to other silver medal designs last week in this class of work.

In gold and silver work and enamels, &c., there are a few clever designs which seek to escape from the hackneyed forms of the trade jewellers. New ideas are noticed in the gold medal design by Edith M. Linnell, Birmingham, for a set of designs for clasps, hatpins, &c., which show careful study and adaptation to the material and use. Ethel M. Poppleton, Leicester, receives a silver medal for designs for a chain, pendant, and buttons, which show delicacy and good taste; these are of silver and mother-of-pearl. The silver medal is given to Ernest E. Clark, Derby, for designs for jewel-caskets in gilt wood and matt surface with coloured gesso panels, which exhibit artistic skill and feeling. A bronze medal goes to E. T. W. Ware, Stepney, for design of much refined feeling. Fanny Bunn, Birmingham, takes the silver medal for her designs for panel, "Gloria in Excelsis," and for an enamelled box-lid, both of merit; and the panel in Limoges enamel by Gertrude M. Hart, of the same town, is certainly a pleasing adaptation, and the colour is harmonious. On the whole, a better knowledge of materials and a higher sense of form and line are exhibited in the designs and work.

The book illustrations are not quite equal in number to those of previous years. We note a few of them. Arthur Watts, Regent-street, has two designs of considerable invention in black and white, cleverly drawn, which are awarded a silver medal. The subject of one represents the Red Knight coming back to his mother the sea, bearing dead Elsinore. The other subject is "Riches." A bronze medal is given to Geraldine Morris for a set of small black and white designs for book illustrations of popular subjects, the "Scarf and Scrip," "Will o' the Wisp," &c.—these are cleverly drawn; also Gertrude J. Slade, St. Albans, for illustrations of old buildings; to Richard E. Clarke, Scarborough, for designs for illustration of romantic landscapes, bird's-eye views of a Mediaeval city and of cathedral city, very cleverly executed in black and white. Eugenie Richards takes a book prize for her clever designs for colour prints for children's books in ink. The figures, Dutch and other, are freely and well drawn with a sense of humour. These we shall illustrate. The colour prints are interesting, and more inventiveness in the subjects are shown. Austin O. Spare, of Lambeth, receives a silver medal for a set of clever figure compositions, which display invention and sense of colour. Margaret Lloyd's (Liverpool) bronze medal design, in which historic costumes are treated with a decorative sense of line, shows the value of the stencil in works of this kind. Her stencilled fan-covers are also clever applications of the same process.

The designs for posters show a decided

improvement in this class of art, so often associated with mistaken ideas. At one time these designs were more or less pictorial, in which the artist sought to produce pictures or figure compositions; now designs are dictated by a more logical sense. A bronze medal is given to Gertrude Comber, of Regent-street Polytechnic, for a design exhibiting a sensible treatment of subject and colour. Book prizes are awarded to Arthur Mackinder, Lincoln, for a treatment that will commend itself to the true artistic mind, and to Frank Quirk, Fenton, for a clever drawing of "Cinderella." The designs for book covers also show an improved sense of ornament, both in modelled leather and *repoussé*. An embossed leather Prayer-book case, by Kate M. Eadie, Birmingham, conceived in a true spirit, takes a silver medal; but it is impossible to notice other creditable work of modelled leather. Stencil hangings show an advance. In correct principles a greater variety is shown, and the designs are more useful, and within the limits of the process. The blending of colour to imitate painting is not so much seen. These are distinct gains. The silver medal has been awarded to David H. Hodge, Plymouth, for a frieze and wall filling for an able treatment, though the colour shown in the sketch is preferable to that used. The same prize is given to George Mason, of Bradford, for a clearly expressive design and colour scheme; also to Constance Salisbury, Newcastle-on-Tyne, for a simply arranged design for wall-hanging, treated in a correct manner. A bronze medal is given to Harry A. Wright, Bradford, for a stencilled hanging, well arranged and effective, and a book prize to Winifred E. Burnup, Newcastle-on-Tyne, for a clever stencilled design; but the colour treatment is not as satisfactory as it might be. The wallpapers are not up to the standard of previous years, and not one receives the bronze medal—a rather remarkable fact. We cannot refer here to the textile designs, painted muslins, hangings, &c., which occupy a gallery. There are very few designs for linoleum, and only one receives a bronze medal (Naomi C. Gray, Battersea) for a proper treatment of material. A bronze medal goes to Lily Day, of Norwich, for her design, "Venus Victrix," an embroidered panel for overmantel, cleverly executed. Mabel B. Keighley, Plymouth, takes a bronze medal for a panel in needlework and appliqué, showing a right association of the two methods. The embroideries and laces are numerous, and the designs are up to the standard. We can only mention a design for an embroidered chasuble, by Lizzie Perry, Cork, which is well designed for its purpose, and is truly symbolic. The cross perhaps is rather large and out of scale with the vestment, but the treatment is suitable. The designs for embroidery are creditable, though not of high merit, and a panelled figure design for a linen cloth for Communion table is tastefully treated and executed by Minnie Bolton, of Birmingham. We have no space left to refer to the modelling and drawings from the Antique, painting from still life, water-colours, &c., though there is a better appreciation shown of methods, colour, light, and shade. Arthur Mackinder, Lincoln, has a clever group in oils of a clock with weight. The stained-glass window and reflected light on wall are painted with much feeling. We hope to illustrate this. It takes a bronze medal. We may add there is much confusion in the arrangement of the works, which entails immense trouble on visitors. Each subject and the prizes should be grouped together, and in this way much fruitless toil and search would be avoided.

The Lambeth Borough Council has purchased a site for £1,100 at Brockwell Park for the purpose of erecting upon it a public library.

SHOP AND COTTAGE NEAR BOLTON.

WE give herewith a perspective drawing of a small building near Bolton, consisting of shop and house, with cottage adjoining, all being built of local patent bricks; upper part of shop roughcast. The architects were Messrs. Cunliffe and Pilling, F.R.I.B.A., of Bolton.

A TALL CONCRETE OFFICE BUILDING.

THE Ingalls building in Cincinnati, erected at a corner of two business streets, is fifteen stories high, and is entirely constructed of reinforced concrete. It is 50ft. by 100ft. The structure resembles those of other steel concrete buildings; but this is the first tall office structure built on this system, and new methods had to be used. It differs much from the ordinary steel-cage skyscraper, where the operations conform to recognised standards, and is of two distinct classes: steel construction and floor and wall building, which are successively executed. In the concrete building the construction has to be carried up solidly and continuously. After the site was cleared, and the adjacent buildings shored and underpinned, the foundations were laid, the footings were built, and the column and wall moulds were set on them. The *Engineering Record* says: Most of the columns in the stress fronts have concentric independent footings, about 11ft. square and 2ft. deep. For the columns in the party-wall there is not room to make separate concentric footings of sufficient area without extending under the adjacent buildings; these columns are, therefore, arranged in pairs with those of the nearest interior longitudinal row, and each pair is supported on a single length footing perpendicular to the party-wall, and symmetrical with the centre of gravity of the two columns. There are six of these footings, which consist essentially of a continuous pyramidal platform having integral with it an upper longitudinal rib, which, like the extended base, is reinforced with twisted steel rods calculated to take the tensile stress. This construction resembles the system of grillages, distributing girders and columns to balance wall columns in steel cage construction, and has the merit of making the whole substructure a single solid mass instead of separate members. The wall connecting

these exterior columns is cast with them, and is only 4in. thick next the adjacent building. Around the windows the walls are 8in. thick to provide suitable reveals; the street walls are 6in. The *Record* give illustrations of the building during erection, and the details of foundations and the concrete mixing plant and moulds. Messrs. Elza and Anderson were the architects who designed and supervised the work. Four large bins were built on the cellar floor, and were filled with cement, sand, and stones, delivered by waggons, and dumped through holes in the side-walk. The cement bin was provided with a special inclined chute to allow the cement bags to slide down to the lower level, and these bins contained material enough for two stories of building. Special barrows were used for sand and stone to insure the proper proportion of each, and these materials and the required bags of cement were dumped from the wheelbarrows directly on to the revolving drum of concrete mixer, and then were discharged into the hauling bucket. This is described. The mixer, bucket, and wheelbarrows are made by the Ramsome Concrete Machinery Co. The average progress is about three stories per month of finished structure. The columns are made in moulds, having vertical boards nailed to outside horizontal battens to form the sides of square pillars. They are held in place by horizontal wood yokes on opposite sides, connected by bolts through the projecting ends. The moulds for floor beams and girders are carried on pairs of wooden joists on the column moulds, supported where necessary by extra joists and verticals. These moulds are of vertical and horizontal planks nailed or clamped together, and on their upper edges to horizontal 2in. planks which support the floor slab. No falsework or scaffolding is required. The column moulds are dumped from the floor above to the bottom of moulds, the steel rods being placed before concreting is commenced, and wired in position. We may add the Ferro-Concrete Construction Company are doing this work. The steel reinforcement of floor is shown. The horizontal, transverse, and longitudinal floor bars are in double tiers, supported on occasional cross rods to hold them up above the moulds before the concrete is placed. This is dumped from wheelbarrows, spread to required thickness, rammed, and the surface dressed smooth to straightedge

and gauge. The moulds for the wall columns are made with three sides only, the side next wall being omitted so as to make the concrete unite with the face of wall. The wall moulds, which are pierced by openings, are built of horizontal boards fastened together with vertical battens nailed on the outside about 3ft. apart. Three sets of moulds are used, so that the lower one is constantly removed and re-erected while the upper one remains in service. The walls are faced with marble and brick veneer. The work is still in progress. The concrete girders are supported as long as possible after the moulds are removed, so as to afford the concrete time to attain its maximum strength before being loaded. They are wedged up to temporary vertical shores under their centres. This building will be a good example of the possibilities of concrete reinforced with steel. We are indebted to the *Engineering Record* for these particulars, and refer our readers to that journal for a more detailed description of the work and apparatus employed. When completed, this Cincinnati office building will afford an example of the method of construction. Is it too much to expect that in London a similar use of reinforced concrete construction may be made for certain structures? The engineering designs and details of construction were made by Mr. Henry N. Hooper, chief engineer to the contractors, the Ferro-Concrete Construction Co.

TESTING A FLOOR.

AN instructive and interesting experiment took place before a company of architects, engineers, and other scientific experts last week at the extensive stores of Messrs. Whitbread and Co., of High-road, Tottenham, the object of which was to test a floor 25ft. 9in. span constructed on Hennebique's patent system of ferro-concrete by Messrs. W. Cubitt and Co., of Gray's Inn-road. Mr. Arthur Dixon is the architect of the new buildings. The Hennebique system of ferro-concrete construction has this decided advantage over many other systems, it employs each material to the most economic advantage to perform its own function, not, as in many others, using iron and concrete wastefully, and without regard to their distinctive functions. Thus the beam on this system is treated in the

THE VILLAGE CLUB AT HOLMWOOD SURREY

HERON & BELLAIRES, JOINT
JOHN H. BEART F.O.S. ARCHITECTS

most scientific manner. The portion above the neutral axis engaged to resist compression is of concrete, while the lower part is composed of steel rods embedded in the concrete, which take all the tensile stress, the shearing stresses being dealt with by steel stirrups hooked at top of beam, which support the rods at intervals, and are placed nearer together at the points of support. In fact, the ferro-concrete beam in its construction resembles the old-fashioned trussed timber beams, in which an inverted iron bar truss was introduced in the thickness between two pieces of timber. In the Hennebique system the lower steel rods pass horizontally through just above the soffit of beam, while the rods above form an inverted truss in tension where the greatest bending moment exists, the ends being carried up to the top of beam or over the support if it is a continuous beam. The strains on the beam are thus utilised to the greatest extent; concrete is superseded when it has little to do. We may compare the Hennebique system of floor with the I rolled iron or steel beam, but instead of the narrow upper flange of the latter, the compression is taken by half the concrete floor slab on each side of the concrete beam, and the tensile stress by the steel rods in the bottom part of beam: thus a far more efficient floor is provided, though the concrete beams look a little heavy below. On the occasion of our visit last Thursday week, the floor, over a long basement store, was being loaded in the centre with bags of ballast. The floor, of which the plans and section were on view, is one of considerable length, eleven bays of 11ft. 2in. centres, and, as we have said, 25ft. 9in. clear of the walls. The main cross-beams are, including the concrete floor thickness, 27in. in depth, or 22in. from ceiling to soffit of beam, and its width is 19in. There are eight steel rods at the bottom, each of these being 1½in. diameter. The effective depth of floor is about 21in. These main beams rest on concrete templates or plates on the thick brick walls. Longitudinally, the floor is divided by four smaller beams, which rest on the larger; each of these is 9in. by 5in., or 14in. deep if we include the thickness of floor. In these beams two steel rods are imbedded at the bottom. The concrete flooring is 5in. deep, and on the top are imbedded a number of steel bars transversely. One large beam at the end of store has a weight of 100 tons, and six steel rods top and bottom. As the loading proceeded, the instruments for recording the deflection in the centre beam were carefully read,

and the results noted in the diagram on a table. Three instruments—one in the centre and one at each end, near to the wall-bearings—were used. We were informed by the architect that a live load of 4cwt. per square foot was required, but that the floor was to be tested up to 6cwt. per foot, or 50 per cent. in addition. The cement and shingle were mixed in the proportion of 4 to 1. Martineau's cement was used. The observations and readings of the instruments showed a steady curve made by the increments of the load. When 57 tons were placed on the floor there was barely a deflection on centre of ¼in. When 70 tons were put on there was about ½in. or nearly. At nearly 3 o'clock the load on the floor had reached 86 tons, or equal to 6cwt. per square foot of flooring, and the deflection was as nearly as could be read ¾in. (4.8mm.), very small, proving that the concrete beam with its steel rod reinforcement had been brought into action. The load on the floor was afterwards increased by 50 per cent. After the instruments were read, the load was removed and the reading was again taken. The result of the test is highly satisfactory, as proving the value of this combination of steel and concrete for floor construction. The deflection under the load is too small to be taken into account, and the floor and beams resume their normal condition when the load is removed. We notice a slight but appreciable camber has been given to the beams. The test is another proof of the applicability of this system to the construction of floors carrying heavy loads. Some time ago we illustrated examples of the system applied to supports and floors, and pointed out the fire-resisting properties of the invention. The metal is reduced to a minimum and is well covered with concrete. Under the most intense heat the rods are kept in position. They are secured to the body of the concrete by the stirrups, which keep them from twisting or buckling, a source of danger with the ordinary iron or steel beam, even if protected underneath. Mr. L. G. Mouchel represents the Hennebique system in this country.

THE VILLAGE CLUB, HOLMWOOD.

THE club and caretaker's residence were erected at a cost of £1,440, from designs by Messrs. Heron and Bellairs and John H. Beart Foss. Local materials were employed, portions of the exterior being rendered in roughcast. The

clubroom is spanned by an open-timber roof, the floor being of wood blocks. The work was admirably executed by Messrs. Colls and Sons, Dorking.

ON BUILDING TIMBERS.—XXXIII.

HARDWOODS.—(Continued).

IN the enlargement of a free library just opened in the North-West of London the walls are lined for about 4ft. up from the floor with a dado of pitchpine, and the treatment of the wood in this work is so unfortunate that a notice of it may, with advantage, be given here, as the lesson to be drawn from this failure, if applied to the woods described in this section, will show the use and abuse of fancy woods in ornamental work. All wood used in joinery is covered with paint, or polished, this latter including varnishing. In one case the grain of the wood is completely hidden, and in the other it is exposed and emphasised by covering it with gums of one kind or another dissolved in spirit or oil. Where the wood is to be painted, it is clearly a matter of no importance how the grains run, except from a structural point of view, and this is not now under consideration; but when the grain is exposed it becomes a matter of the first importance that the wood be cut and selected so as to be suitable for that special part of the framing in which it is to be used. All joinery consists of framing and panelling with added mouldings, and where the grain is to be exposed it is universally agreed that the panel must be the most ornamental, and consequently the most highly figured wood; this being so, as a contrast to the panel, the framing must be straight framed and have as little figure as possible, so that at a distance the eye may at once distinguish one constructive part of the framing from the other part. In other words, the stiles and rails must be selected so that they shall stand out clearly and distinctly from the panels, and be in no way confused with them. Patchiness of effect may also be produced by using wood of different shades: sapwood, dried before it "blues," is, in pitchpine, lighter than heartwood, so that difference of shades of colour may produce as important an effect as differences in grain or figure. Now, in the particular framing referred to there are mistakes of colour and mistakes of grain, and these are striking as the work is new and highly varnished. In several panels there is a joint generally to one side or the

other of a centre line. On one side of this joint the wood is highly figured, on the other side it is comparatively plain. This throws up the joint, marking it unmistakably, and disturbing the face of the panel by breaking it into pieces which abruptly abut against each other. In other panels the figure is the same all over the panel; but one-fourth the panel is light sapwood, and the other three-fourths dark heartwood. Of course, the result is equally unfortunate, for the object should be to endeavour to hide the joint instead of making it plain to everyone. In the framing, again, some of the stiles and rails are cut with a radial face and others with a tangential face, giving totally different "figure": the wood, too, is mixed light and dark sapwood, "kiln dried" perhaps, and heartwood. The effect of the whole is decidedly patchy and bad, and to one who knows that a very little time and thought would have prevented this, it is as intolerable as the neglect to guard against it is inexcusable. In joinery which is to be varnished, all the different pieces which go to make it up should be carefully selected for the positions which they are to occupy. Let all the stiles and rails be straight-grained, and all the panels be figured, and the same coloured wood be used throughout for the former, and, if necessary, another coloured wood for all the latter; but avoid mixing grain, figure, and colour indiscriminately all over the work. If the stiles are 4 in. or 4½ in. wide and 1½ in. thick, let the 4½ in. face be from a radial cut; if the rails are of the same width, or over, let them, too, be from radial cuts. The panels to be figured must be cut tangentially, and let them all be so cut, and of wood of the same quantity of figure, and of the same colour. On examining the boards in a naked floor a few will be seen with the grain running in parallel lines from one end of the board to the other. These parallel lines represent a section of the tree from which the board was cut, along a line radiating from the centre to the circumference. The other boards show irregular conical-shaped lines which follow each other and die out a few inches apart all along the board. These lines represent tangential sections of the annual rings, and a mere inspection of the board will tell at once whether the face is cut radially or tangentially. Again, if the face of a tangentially cut board is round, having originally been planed flat, that face is the heart of the wood; if, on the contrary, the face of the board is hollow, the heart face is on the joist, and that near the bark is turned up. In selecting wood for framing, an inspection of the end of the piece will always tell how it has been cut and the best way to utilise it. As a matter of fact, for all good work, after the "deals" are selected, the scantlings required should be marked on the end before they are handed to the sawyer. To turn a number of deals over to a sawyer to run them anyhow through a deal-frame or circular-saw is only to butcher the stuff and ruin the work. All highly-ornamental hardwood is obtained from burs, warts, excrescences, or other abnormal growths on trees. It has no strength and little cohesion, and must, therefore, to stand in joinery, be cut into veneer, and attached to some straight-grained wood which will support it. In many hardwoods, a slight change of colour in the face of a piece of veneer makes some more or less distinct shape. In this case it is usual to join in a wide panel each face of the same cut, so as to make a symmetrical marking in the panel. Even in door panels only 9 in. wide some beautiful effects may be obtained by veneering each panel face in four pieces, the end pieces being mitred into two others, joined down the centre, the peculiar marking or shaping of the grain being carefully matched in all four pieces. There is no handsomer wood for oak door panels than dark pollard oak, especially that obtained from trees in which the heart has been decayed for some time. A tree cut for this purpose by the writer was over 7 ft. in diameter, with a hollow in the heart of over 5 ft. in some places; in fact, it was a shell of wood about 12 in. thick. To cut this down with a "cross-cut" saw it was necessary to lap and rivet two saw-blades together in the centre of the tree. This was easily done, as there was an opening in the side large enough to admit the workmen. The wood proved to be of such a splendid rich colour and handsome figure that at a distance it was almost impossible to realise it was wood when the face was carefully matched in panelling (as suggested above) and varnished. It is quite possible that work done as suggested may be considered more "cabinet" than joiner's work,

but it must not be forgotten that all good joinery is, or should be, quite as well finished as cabinet work, and one really merges into the other. A good bench hand should be able to do good work in furniture making, and some of the best oak doors can be made by cabinet-makers if their joints are carefully looked after; the bench hand is best at joints in building joinery—that is, in arranging the structural part of them—but for close jointing and finish the cabinet-maker will surpass him; the best work would be produced by joiners and cabinet-makers working in harmony to secure that end. To make this plainer, if a cabinet-maker makes, say, an outside door in oak and it shrinks, daylight can be seen through the mitres if the mouldings are in the solid, for he has not arranged his joints to allow for shrinkage. A joiner's door, no matter how much it shrinks, in reason, will have been so constructed that light cannot be seen through it, and this is so, for the evolution of the bench joiner has been on different lines to that of the cabinet-maker. To some architects veneered wood is an abomination. This view is held by men who know nothing about wood, or only as much as the old lady who, in wishing to dispose of her piano, assures the would-be purchaser that the case is all "solid walnut." Neither see that, owing to the peculiar structure of the wood, if it were solid it would be perfectly worthless for anything but the fire, and not much good for that. "Gothic" men are dead against all shams—at least they say so—and veneered wood is one of these; but, after all, there is less false construction in covering one wood with another which needs support, than in buttressing walls which need no support, or in putting string-courses and label mouldings where there is no rain to be thrown off the walls, and where they are a useless and expensive nuisance. The Goth hates all shams except his own; the same may be said of the Classic man, with his columns which carry nothing until he puts sham entablatures and cornices on them; in fact, to parody "Hindibras," both—

Compound for shams they are inclin'd to,
By damping those they have no mind to.

The æsthetic value of any particular feature in a building may be due either to accident in its design or to its execution. Leaving the former (as it is popularly understood) out of the question, for an architect is always an artist in his own estimation, it is obvious that work which shows on the face of it careful handling and thoughtful arrangement of parts will afford more pleasure to a spectator than that which is clumsy and slipshod. Veneered work will therefore be valued in proportion to the skill with which it is put together, and to make its use a success the workman must use his brains as well as his hands.

IRONWOOD, *Xylia dolabriformis*, is a large deciduous tree found in Southern India (ranging northward to Bombay and Orissa), Arracan, and Burma; it is from 90 ft. to 100 ft. high and from 3 ft. to 4 ft. in diameter. Next to teak it is the most important tree in Burma, where it is found in all deciduous forests of the Irrawaddy Valley up to 24° latitude. Ironwood is hard, coarse-grained, and beautifully mottled, showing wavy fibres on radial sections. The colour is a dark brown inclining to red, and it is very heavy, a cubic foot weighing 60 lb. There is a good deal of resin in Indian ironwood, but there is much more in the Burmese wood, which makes it the more durable wood of the two. Both are used for piles and framing in viaducts; much of this wood is also used for railway sleepers. Honduras ironwood is a tree known to botanists as *Laplacea hematoxylon*. New South Wales ironwood, *Syncearpia leptocarpa*, is a tree about 50 ft. high, the wood being much used for rough engineering work. An ironwood commonly used for tool-handles in Tasmania is furnished by a small tree known as *Notelaea ligustrina*. At the Cape there is a black ironwood, *Olea laurifolia*, which is used for the framing of waggon beds; it is as durable as *Lignum vitae*. A white ironwood found in Natal, *Toddalia lanceolata*, is a hard, tough wood used like the black ironwood for waggon frames. Some stray logs of ironwood find their way into the market here, but they are not purchased for building work. IRONBARK, *Eucalyptus paniculata*, is an Australian tree which grows to about 100 ft. high, and from 3 ft. to 3½ ft. or more in diameter. The wood is hard, strong, and tough, but without much figure. It comes here in squared logs, which are sold by the cubic foot, caliper measure, at about 18d. There are usually from 70 to 80 c. ft. in a log. KARRI, *Eucalyptus diversicolor*, is the largest and

most valuable tree found in the Australian forests; an average specimen may be put down as about 200 ft. high and 4 ft. diameter, with no branches within from 130 ft. to 150 ft. of the ground. Trees up to 300 ft. high are not unusual; they have a diameter of nearly 10 ft., and contain over 100 tons of timber! This wood is hard, heavy, elastic, and tough; the grain shows that the fibres are interlaced, which makes it a wood hard to work, and, therefore, more suitable for use in engineering than in joinery. Karri may be seen laid in the wood-block paving of many streets in London, Dublin, and other cities: it is easily recognisable by its deep red colour. The blocks are usually 9 in. by 3 in. on the face. For heavy traffic the depth is 5 in.; in other cases 4 in. is found to be ample. In Paddington the life of a "Baltic deal" block is from five to nine years, according to the traffic: Karri is found to last three or four times as long in this latter respect. JARRAH, *Eucalyptus marginata*, though it is shorter and more brittle in the grain than Karri, ranks with it in value for wood-paving. Jarrah has been used for furniture and joinery; its hardness, durability, and colour recommend it for both purposes; but the labour in working it will prevent this wood from being extensively used in building. With that perversity which characterises dealers in wood, they have given the name of "pine" to the timber. It has been pointed out before that they persist in calling real pine "fir" and "deal": Sequoia, Jarrah, and Mid-European pine are all "redwood"! Prime "Kauri pine" planks are put on the London market from 1½ in. to 5 in. thick. Common widths for the 1½ in. are 22 in., these, 4 and 5 in. thick, can be had up to 16 in. wide, the lengths being from 6 to 33 ft. Jarrah, "dry," in scantlings, can be obtained from 3 in. by ½ in. up, and from 5 to 26 ft. long. An ordinary marketable stuff 1 in. board is worth about 3d. per foot. LIGNUM VITÆ, *Garcinia officinalis*, is an evergreen tree found growing in Jamaica, Hayti, Cuba, Colombia, and Venezuela, where it seldom attains a greater height than from 20 ft. to 30 ft. The wood is very hard, and so heavy that it sinks in water, a cubic foot weighing 83½ lb. (water weighs only 62½ lb.). The lignum vitae of British Guiana is the wood of *Lorota trifolium*, a tree which grows from 30 ft. to 60 ft. high, and from 16 in. to 18 in. in diameter. New South Wales lignum vitae is *Arceuthobium falcata*, a shrub, in fact, which attains a height of from 15 ft. to 20 ft., and a diameter of from 8 in. to 14 in. Another lignum vitae, *Callistris quadrivalis*, is common in Oranian and Algerian Tell, and in Tunisia; the heartwood of this tree is brownish red, and the sapwood white. There is also lignum vitae in the Lower Guinea and Mozambique districts; it is the wood of a large tree known as *Combretum truncatum*. This is also compact and hard, the heartwood being a deep reddish brown, with white sapwood. Lignum vitae comes into the London market from Jamaica and Maracaibo. It is sold by the ton in pieces weighing a little under 100 lb. each. LOECST WOOD, *Hymenocleis courbaril*, is an abundant tree in British Guiana, where it grows from 60 to 80 ft. high, with a diameter of 8 ft. or 9 ft. The wood is hard and close grained, the colour being reddish brown streaked. It does not split or warp, and takes a good polish. Loecst wood is also found in Trinidad. Some logs from Demerara were recently offered for sale in London; the smallest log contained about 41 c. ft., and the largest 95 ft., caliper measure. A locust wood, *Robinia pseudacacia*, grows east of the Rocky Mountains in the United States; this tree attains a height of from 70 ft. to 80 ft., with a diameter of from 3 ft. to 4 ft. The wood is largely used for trenails. MAHOGANY, *Swietenia mahagoni*, is a large tree, which yields the most valuable furniture-wood. In building it is commonly used for handrails, w.c. seats, and bath-tops; in good work it is used for sashes, doors, and partitions in banks and other commercial buildings. The architect uses it in his T-squares, the open grain of the wood rendering it necessary that the ruling edge of the blade be covered with a strip of ebony. A few months ago three logs of mahogany from Axim sold for £3,230; they were cut from one tree, and contained 6,852 superficial feet. The largest log was 25½ ft. long and 46 in. deep at the butt. African mahogany, *Khaya Senegalensis*, is shipped from Axim, Assinee, Benin, Boutry, Cape Coast, Grand Bassam, Grand Lahou, Lagos, Sassandra, Sapeli, Sekondi, Twin Rivers, Coco Beach, and Cape Lopez ports along the Gold and Ivory Coasts. "Cuba" mahogany is shipped from Jucaro, Tunas de Zaza, Trinidad, Santa Cruz,

and Manzanillo; "Tabasco" from Laguna Determinos; "Honduras" from Belize, Truxillo, and Puerto Barrios (Guatemala); "St. Domingo" from Porto Plata. Mahogany also comes from Panama (New Granada), Mexico, New South Wales, Moulmein, Caobang in Tonquin, and Cispata in Colombia. Of all these various kinds of mahogany St. Domingo wood stands unrivalled for texture and brilliancy: it works well and always looks well. Mahogany should be thoroughly dry before it is used in any joiner's work. "Bone dry" is the usual expression to describe its condition; but no one knows what "bone dry" means. It is a popular phrase taken to mean much, when in reality it means nothing definite. The commonly accepted criterion of seasoning in mahogany is the condition of an inch board under cover on sticks for one year; but this method of determining the value of "seasoned" mahogany is absurd, for a 6in. plank will not be in the same condition after six years as an inch plank after one year's exposure. All wood on sticks under an open shed will contain more moisture than if stacked in a closed shed; and this latter will not be so dry as wood in an atmosphere artificially warmed. It is therefore time for timber merchants who invoice "dry" mahogany and other woods to adopt for their own protection some scientific standard of dryness or seasoning, to which they may refer for an authoritative settlement of any dispute arising out of their trade transactions. It is amazing to think that Englishmen, who pride themselves on being possessed with such an unusual amount of common sense, fail to see the absurdity of asking a lawyer sitting in one of their courts to decide what dry wood is. Three highly-paid public servants will sit in an "appeal" court all day racking what passes for their brains, trying to solve the conundrum, "When is a painter's ladder not a ladder, but a scaffold?" Others can't tell when chalk ceases to be chalk and becomes lias: while a third contingent is puzzled to know if ground Kentish rag is Portland cement or not! Surely the sense of humour must be dead in a country where men take the decisions of such courts seriously! The value of mahogany will depend on the size, condition, and figure of the log; but for ordinary sorts the following are fair average prices: Honduras 4½d., Cuban 8½d., African 7½d., Tonquin 5½d., Tabasco 7½d. Prices range from 3½d. to 3s. 6d.; special logs go up to 8s. and 9s. Mahogany is always sold by the superficial foot, the sale contents being much under the extreme contents.

MAPLE, *Acer saccharinum*, syn. *barbatum*: Sugar tree, sugar maple, hard maple, rock maple is a tree which grows to over 100ft. high and 4ft. in diameter. It is found in Canada as far west as the shores of Lake Superior, in the north-east United States, west to Mississippi, and along the mountains to North Carolina, growing best in the Adirondacks. The wood is very hard, close grained, strong, and heavy, weighing about 43½lb. to the cube foot. Its colour is light brown of various tints, the sapwood when dried being yellow. It is used for interior joinery, flooring boards, and furniture. A maple floor may be seen in Messrs. Stanford's, the publishers, Long Acre. The tree is called the "sugar maple," for the sap yields sugar on being evaporated, and it is said that bleeding the tree does not injure the wood. About 3gal. of sap will make 1lb. of sugar. The season's yield of one tree will be from 2lb. to 30lb. The abnormal growths or freaks, known as Bird's-eye, Blister, Pin, and Curling, occur more in maples than any other trees. "Blister maple," when polished, shows a surface covered with markings like blisters: this is sometimes called "landscape maple," and it is the rarest of all figures in this wood. The best figure is found near the bark, and the poorest towards the heart of the tree. Blister maple is only a larger and more exaggerated form of the marking so well known, chiefly from grainers' imitations of it, as "bird's-eye." A radial section of the wood shows straight grain barred across horizontally with medullary rays, which are brown streaks and dots across a silvery background. The ornamental wood is used as veneer, which is turned off tangentially from the bark to the heart in a lathe made specially for the work. The peculiar structure which gives this "bird's-eye" grain is seen in a transverse section of the trunk to cross it from the bark to the heart. All trees do not yield figured wood. An expert can tell from the bark of a standing tree if it is likely to be "blister" or "bird's-eye" maple. The wood is imported in logs and planks, the former

being sold by Customs string measure, and both by the cube foot. **MARBLE WOOD** or **ZEMBA WOOD, *Dispyros Karsii***, is an evergreen tree of the Andaman Islands, where it grows large enough to furnish logs about 20ft. long, from 9in. by 9in. up to 12in. by 12in. square. The wood is hard, difficult to season, and it shrinks and warps. From its being striped with black and grey it is called zebra wood; the sapwood is grey. The New South Wales and Queensland marble wood is obtained from a tree known to botanists as *Olea paniculata*; it is hard and durable. **MYALL WOOD, *Acacia pendula***, grows in New South Wales and Queensland; it is from 25ft. to 30ft. high, and from 16in. to 18in. in diameter. It is also called violet wood, for when cut it gives off a scent like violets. It is dark-brown, hard, and compact-grained, easily worked, and used chiefly for cabinet-making and tobacco pipes. A variety found in Victoria, *Acacia homalophylla*, also emits a strong smell of violets when cut. It is used for similar purposes as that found in New South Wales. Myall wood is sold here by weight, in pieces not quite one hundredweight each.

PROTECTION AND PRESERVATION OF WOOD FROM FIRE AND DECAY.*

THE problem of wood protection, of converting it from a highly inflammable into an absolutely non-inflammable product, has floated before the minds of generations of men rather as a vague, dreamy proposition than as subject-matter upon which to concentrate intense intellectual attention. Sporadic efforts, void of practical utility, are historically recorded at irregular epochs, from Roman days to the present time. So little is known by the general public of the practical results achieved in the line of protection of wood from fire, that it is a tax upon its credulity to ask it to believe that the wood of a structure can simply, rapidly, and cheaply be rendered as non-inflammable as brick or stone. It is even likely that such a statement may be questioned here and now. It is not claimed that wood cannot ultimately be disintegrated and destroyed by attacking flame, as we know brick, stone, and steel may be; but it is claimed that wood may be so treated, and that the wood before you is so treated, that, upon the withdrawal of such flame, it will not of itself, except perhaps momentarily, hold flame, whether in beam, board, or splinter. If this be literally or even measurably true, what is its significance? Many years ago, in a great fire on Chestnut-street, below Third-street, in this city, the heat was so great as to disintegrate enormous masses of the granite walls. If wood is robbed of its inflammability, it is voided of its most serious objection in a structure. If the wood in a building will not inflame from fire attack, but only slowly disintegrate, as other non-inflammable materials will from contact with fire, then the contents of the building alone can be destroyed by fire in the building. Further, if the contents of a room inflame and the wood will not, then the fire can be localised, because the wood will not receive or transmit flame. The elimination of the inflammable characteristic from wood is therefore a matter of vital consequence. And such treatment, further, as shall cause it to resist disintegration from fierce heat the greatest length of time, without at any time inflaming, must be the most desirable. The sum of values arrived at, as a resultant of all recorded study, invention, and scientific deduction, up to the beginning of the present decade, as to protective treatment of wood, may be stated as:—

1. That wood is susceptible of absorbing varied percentages of liquids.
2. That certain chemical solutions, when injected into the cellular structure of wood and afterwards dried, leave a residual deposit of dry chemical therein, from which, with water, the solution was originally formed.
3. That such impregnation may be effected by pressure mechanically applied and by incidental processes.
4. That such deposit of chemical substance in the wood cells has in one case a preservative and in another a fire-resistant effect.

Practically, this formula condenses the whole state of the art up to a very recent period. The mechanical saturation of wood is really a new art.

* Extracts from a paper by Mr. Joseph L. Ferrell read before the Engineers' Club of Philadelphia, and published in the *Proceedings* of the Club.

It found its first concrete development less than thirty years ago, in apparatus designed to saturate timbers with preservative solution. Previously abortive efforts had been made on a smaller scale, but were of no practical account. Strangely enough, the preservative proposition claimed first attention; and as the work to be done required capital, capital called upon the engineer to formulate the apparatus with which to saturate the wood. The original theory of saturation, in its processional steps, is practised to-day with but slight modifications. Fourteen preservative plants exist in this country, five in England, three in France, and five in Germany, as reported. All have the original typical apparatus and system of saturation, so far as can be ascertained. The belief prevailed, and prevails, that the interfibrillar and cellular system of wood contained elements denominated sap, which, according to recognised authority, was vicious, and generative of destructive fungus. No distinction seems to have been made between the *real sap*, the solid deposit, and the *sap water* which came to the tree heart from the ground laden with vital power, performed its function, parted with its tree food, and failed to find its way as simple water into the atmosphere, only because the tree was cut down. This *sap water* is very favourable to the propagation of germs, and is therefore really an undesirable element in wood. But the sap water is very small in amount in lumber cut for any time, and there is no reason whatever for any effort to eliminate it. For if the preservative solution is of any strength or value, it will impregnate such sap water, and utterly destroy any germinative tendency. But the fact is that every effort is actually made to liquefy the *real sap*, the soul of the wood, and suck it out by vacuol extraction. The real bottom fact of the matter is that the original creator of the theory of saturation realised that, in sappy woods like yellow pines, the sap, being in such large volume, would resist saturation, and the only way he could see to get over the difficulty was to liquefy the sap by steaming, and exhaust it by the vacuum-pump. Within the last two years a statement was made in a scientific journal, describing this process, that this result was so successfully accomplished as to "leave the wood in a condition of a finely divided honeycomb." Comment on such a statement is superfluous. The steps of process by this original method of saturation are, after the cylinder is charged:—

1. To introduce steam to liquefy the saps.
 2. After prolonged steaming, to remove by vacuum pumps the substances so liquefied, the operation requiring many hours.
 3. To fill the cylinder with the preservative solution, allowing it to impregnate the wood, so far as it will, by its own infiltrative action.
 4. Then applying hydraulic pressure to complete the saturation. This apparatus and process mark the first systematic effort to produce a commercial result in the saturation of wood, and it has been continued from the first until now, with immaterial changes, as the universally adopted type.
- That the business of preservative saturation has not obtained universal acceptance may proceed from several causes:—

1. The process of saturation occupies undue time, rarely taking less than 24 to 30 hours for a charge.
2. Heart saturation in timbers of moderate square section is incomplete.
3. It is believed that the strength of the wood is seriously impaired by the processional steps, steaming and exhaustion of the liquefied sap.
4. The chemicals put into the wood, being excessively dilute, are ineffective.
5. That the exposure to atmospheric influence causes them to volatilise.
6. That the cost for such a modified result is excessive.

At any rate, it is manifest that the growth of treatment of wood with preservative is sluggish, and not at all in proportion to the advance in price of such woods. It would seem that, if it were clearly demonstrated that ties, piles, and bridge-timbers could be saturated at reasonable cost with a preservative which would treble or quadruple their average life when untreated, in a country like ours one hundred plants would scarcely suffice to meet the demand, instead of fourteen in thirty years. The advance in cost of ties, owing to the great railroad development of the country, and rapid exhaustion of the timber, has, however, induced a number of the Middle West and Western railroads to put in plants of the old type,

to treat ties, and their growing use is evidence that it is found an economy, even with the crude apparatus and an expensive chemical. Observation of the operation of the mechanism and processes employed, and a study of wood and its susceptibility to absorption of liquids, led to the conclusion that the desired results could be obtained by much simpler mechanism, and an entire reversal of process. The old form of apparatus consisted of a cylinder of from 62 to 84 in. diameter, and from 85 to 112 ft. long, closed at one end, having a massive door at the other, swinging either horizontally or lifted vertically. This door is fastened by a multilocking system of bolts passing through lugs on the periphery of the cylinder. It is obvious that an external joint of from 62 to 84 in. diameter which has to be opened, say, once or twice every twenty-four hours presents a practical difficulty of great significance when it is desired to make it absolutely tight against any considerable pressure from within. If it leaks badly, no uniform pressure can be maintained. Further, perfect saturation, even of lin. thick white-pine boards, cannot be effected in any practical time unless a pressure of at least 175 lb. is applied for several hours, no matter what preliminary process may have been employed. If a pressure of 175 lb. is put on the 84 in. gate-area, it has been found impossible to maintain a tight joint and even pressure. If much leakage occurs, the pressure-pump must take it up, and, in speeding up, its reciprocating shocks, delivered against wood whose exterior surface has been softened by previous steaming, exert a most damaging and disastrous effect. Therefore, the method of employment is to use, as that part of the process, a lower pressure, and avoid the rupture of the joint and damaging compression of the wood; but this is accomplished only at the cost of a great extension of time. The new method wholly abandons all preliminary process. It was found from long practical testing that it was erroneous in principle, uncalled for, enormously expensive, and practically ineffective. As stated in published descriptions, saturation of boards and planks by the old system required from 24 to 40 hours. The new mechanism is, instead of a cylindrical body of 84 in. diameter, 50 in. in diameter, and 112 ft. in length. The cylinder body is made up of cast-steel flanged sections, 2 1/2 in. thickness of metal, with a special hydraulic joint at the flanges capable of enduring a hydraulic pressure of 1,000 lb. per square inch. At each end is a domed gate, with a vertical hydraulic cylinder superimposed, which operates a vertical gate-valve weighing five tons. The gate is provided with phosphor-bronze rings, as also the inner and outer guide surfaces. When the internal operating pressure comes upon the gate, these ring surfaces coincide, and the joint is perfect, whether with 10 lb. or 1,000 lb. pressure. The greater the pressure, the tighter the joint. In this case it is the reverse of the old externally-applied gate. Furthermore, all possibility of communicated shock from the pressure-pump is obviated by the interposition of a hydraulic accumulator loaded to the normal saturating-pressure of each kind of wood. For white pine the normal saturating-pressure is 300 lb., yellow pine 350 lb., ash 400 lb., chestnut 400 lb., beech, birch, and maple 450 lb., oaks 650 lb.; and the direct saturation in this machine of lin. thicknesses of woods can be performed under these pressures because of the absorption of shock from pressure-pump, with perfect results to the wood, and in a small fraction of the time required by the old system. The wood is simply taken as it comes from the source of supply, put in the cylinder, the gate is closed, the cylinder is run full of saturating liquor, pressure is applied, liquor is returned to the tanks, the lumber is run into dry kiln, and another charge of lumber is run into the cylinder. The process is identical whether the wood is saturated with preservative or fireproofing solution, with this exception: The growth of experience demonstrated that the criticism of engineers regarding the non-permanence of the preservative solution hitherto injected into ties, piles, beams, &c., was a just criticism. It would seep out, slowly, perhaps, but inevitably, under varying atmospheric conditions. For instance, several railroad companies having tie-treating plants believe that chloride of zinc most effectually acts as a fungus-destroyer. Chloride of zinc is an expensive chemical, costing from five to six cents per pound. Therefore, to be able to use it for their purpose, and not make their product too costly, they use a very dilute

solution. In its dilute form the residual protective matter left in the wood is so slight that successive rains and evaporations in a relatively short time exhaust the infused material—wash it out. Practical investigation having positively confirmed this, it was believed that for wood exposed to weather conditions no treatment would be permanent except such a one as would create a chemical double decomposition in the interior of the wood. Three years of continuous investigation resulted in the production of an apparatus applicable to the treatment of railroad ties by a wholly new method. This consisted in saturating them *individually*, instead of in mass, which can be done with great speed and absolute thoroughness and uniformity . . .

The saturation of wood to make it *fire-resistant* differs in many respects from preservative treatment. Wood treated to make it fire-resistant is subjected to many stringent requirements not essential in the case of preservative. For instance, the saturation must be complete to the heart. The colour of the original wood must not be impaired. The strength of fibre must be preserved. There must be no lingering of flame on withdrawal of attacking flame. To effect this, the strength of solution must be as high as possible. This, of course, adds to the cost and the density of solution requires greater pressure to infiltrate. The "state of the art" at the time this work was begun embodied the employment of the original apparatus above described and processes therein exhibited. This chemical, superficially studied, seemed to be all that could be desired. Wood saturated with it certainly would not *inflame*. Shavings planed from it would carry no flame. The treated wood would discolour more or less, but the refusal to carry flame seemed so admirable a result that such a defect seemed trifling. Longer acquaintance, however, destroyed the illusion. Familiarity bred contempt. Sulphate of ammonia is a whitened sepulchre. It discolours wood. It effloresces and loses its virtue. It is hygroscopic and destroys paint and varnish. It decays wood inevitably. Its resistant virtue is excellent *while it lasts*, but its endurance against attacking flame is brief. For instance, if we stand vertically a piece of untreated lin. white pine before a horizontal Bunsen burner so that the blue-point impinges, the average resistance to penetration and disintegration is thirty-two minutes. Similarly exposed, the average resistance of a piece of lin. white pine saturated with sulphate or phosphate of ammonia is sixty-three minutes, or an extension of life, due to the chemical, of thirty-one minutes. Now, it is an admirable result to secure immunity from fire for thirty-one minutes, if no better result could be attained, and know that woodwork will not spread flame when treated; but it is not commensurate with the cost, and is not much to be proud of. Universally understood, it would not be considered a valuable commercial result. The effectiveness of ammonia salts to repel flame from a wood surface depends upon the rapid volatilisation of the ammoniacal gas. The greater the applied heat, the more rapid the exhaustion of the protective gas, and, when exhausted, no residual inert substance remains to bar the advance of flame or progress of disintegration. The gaseous emission chemicals were the only known materials used, up to five years ago, in any commercial fireproofing plant. It became necessary to seek for practical materials, operating on a *reverse principle* from the gaseous emission, and after years of laborious effort sulphate of aluminum was discovered to be the substance endowed with the property of fire-resistance inconceivably beyond any previous conception. For instance, the best results from the *gaseous emission* substances was an added life over untreated wood of thirty-one minutes. Now the average of 2,800 pieces of lin. white pine treated with sulphate of aluminum has an added life of seven hours and thirty-eight minutes, or over fourteen times that of wood treated with the gaseous emission chemicals. The most satisfactory result comes from the simple fact that sulphate of aluminum under flame loses its water of crystallisation, its sulphuric acid of combination, and remains then *residual pure aluminum* which has the admirable property of expansion in the vacant cells of wood, to two and one-half or three times its original volume of dry sulphate; and in doing so it interposes between flame and wood fibre a compact mass of pure alumina, infusible by the flame of any conflagration, and an admirable non-conductor of heat. It appears, therefore, that the fire-resistance achieved in saturated wood proceeds from the *massing within*

of an inert and infusible substance, which from its non-conducting character *bars* destructive heat and produces endurance of the mass, and absolute negation to flame, for a prolonged period of time. This, as the best result, seems to assure that the *massing principle* is the correct one; and it is further illustrated and confirmed by the extension of it in a wholly different application. A casual remark was made over two years ago by a prominent insurance man, to the effect that the saturation of wood by sulphate of aluminum was assuredly a great gain to it in fire-resistant quality, but that *he* was quite as much, if not more, interested in the preservation of *existent* structures, from attack by fire, than *he* was in preparation for protection of non-existent structures, or those only in contemplation; and he counselled the serious study of this phase of wood treatment. The proposition, in view of the small results accruing from the multitudinous so-called fireproof paints, was by no means an encouraging one; but the powerful results accomplished on the *massing principle* in the cellular structure of wood bodies indicated the direction to be a *massing* of a series of chemical solutions on the external faces of wood bodies. A wholly new set of phenomena appeared for consideration: All paints known to the writer, applied to the superficies of wood, on the application of heat break up sooner or later, scale off, or otherwise disappear. The attachment to the superficial cells of wood seems to be slight, and to effect a *bond* the *penetrative* effect of an initial application should be marked. A chemical substance was discovered possessed of extraordinary penetrative power, a simple application entering below the surface even of oak 1/2 in. By subsequent coatings, other chemicals, *making chemical union* with the first, insured adhesion and condensation, and an *enamel, not a paint*, grew upon the wood surface, possessing a fire resistance over six times, on the average, that of wood treated by sulphate of ammonia solution diffused throughout the entire wood body. The problem involved the discovery of a *transparent enamel* for hard and fine woods in interior work. It compelled the discovery of means of application to woods covered with old paints and old varnish; the ability to absorb and receive on its surface lead or zinc paints when required; and it finally led to the discovery of means of incorporation of all shades of colouring in the massed enamel, so incorporated as to be proof against wear of weather exposure, and by such incorporation to preserve indefinitely the original freshness and brightness of the colouring matter. The palpable results of this work are before you. The aim has been to honestly and most practically cover the whole ground of wood protection from the attacks of flame and fungus. It is not for a moment claimed that wood treated by these processes is absolutely impervious to fire; that such wood is irreducible by fire; but it is believed that by these processes and chemical solutions wood has gained a large immunity from attacking flame, and that in each instance it will only disintegrate after the flame has persisted for such a great length of time that ample opportunity will be given for extraneous aid to extinguish it. In going over the ground of results accomplished in the more effective protection of wood from fire, the vital value seems to be that its treatment produces unquestionable *non-inflammability*. It thus becomes a determined fact that wood thus treated, sustaining no flame itself, can communicate no flame; and attacking flame can endure only so long as its original fuel-supply remains unconsumed. Therefore, a fire originating in untreated contents of a structure will consume such untreated contents, and may blacken and roughen the surfaces of the structural wood, but can never excite any flame thereon if the fire-resistance resulting from treatment is efficacious, and must necessarily be limited to the radial distance of the extension of the projected flame.

These facts are not only proved by minor tests, as those before you; but in case of actual structures of treated and untreated wood of practical dimensions erected for comparative observation.

RAISING A CHIMNEY STACK.

THE extension of a brick chimney shaft is often required, and the following account of the addition of 50 ft. to the height of a stack for the power house of the Columbus Railway Company is of interest. The shaft was originally 8 ft. in diameter inside and 16 ft. externally

at the top, larger at the base. It was 160ft. in height, and the shaft was built with double walls enclosing an annular air space. It had a cast-iron cap. After the introduction of mechanical stokers, &c., a heightening of the shaft was required for increasing the draught. The extension was made without interrupting the service. The cast-iron cap was removed, and on the top of the cleaned brickwork a single shell of brick 50ft. high, supported entirely on the outer wall of old chimney, was built. It has a batter of 9 : 600. By means of a line carried up by a kite the ropes and tackles were pulled up, men ascended, and attached, by means of chains round old shaft, light radial angle-iron brackets, which were secured and boards were laid on them, forming platforms for two masons and a helper. The smoke, heat, and fumes were such that a light sheet-iron cylinder, 3ft. or 4ft. high, was placed on top of brickwork to protect the workmen. The new brickwork was built of the Custodis standard radial bricks, without metal ties, anchors, or any reinforcement. The platforms were placed 5ft. apart vertically, two or three being in use, and the lower one being constantly removed and placed above the other two. Details of the added structure and the scaffold bracket used are given in the *Engineering Record*. From the section of the new shell, the outer diameter at the bottom, where it rests on the old chimney, is 13ft. 3 $\frac{1}{2}$ in., and the diameter at top 11ft. 9 $\frac{1}{2}$ in., or 10ft. 7in. in internal diameter. The shell is built in three stages or sections: one of 17ft. 2in. at bottom, and two of 16ft. 5in. The thickness of the bottom section is 10 $\frac{1}{2}$ in., the section above 8 $\frac{1}{2}$ in., and the upper section 7 $\frac{1}{2}$ in. In this case the radial made bricks insure a stable shaft. The Alphons Custodis Chimney Corporation Company were the contractors.

unrecognisable. The walls were bricked or studded, and covered with stucco after the style of that period. The two front chimney-stacks were probably added at the same date. It was at first feared that the building was past preservation; but ultimately it was, fortunately, found that enough of the old timbers remained to trace the original construction and to restore the work sufficiently to bring out the history of the building. The work has been carried out by Mr. G. T. Kennard, contractor, Stratford-on-Avon, under the direction of Mr. E. G. Hulston, architect, of that town.

A FERRO-CONCRETE SUBWAY.

THE subway structures of the Philadelphia Rapid Transit Co. will be a good example of ferro-concrete construction when completed. The subway has an outside width of 55ft. and a height of 19ft., with concrete walls 3ft. thick, and a concrete roof 2ft. thick, and a floor of about 17in. minimum thickness. The roof slab is a continuous mass of concrete, reinforced by longitudinal and transverse horizontal steel rods 2in. and 1 $\frac{1}{2}$ in. in diameter and 18in. and 6in. apart respectively. In the centre it is supported on three longitudinal rows of riveted steel columns, I-shaped in section, made with four 5 \times 3 \times 3 $\frac{1}{2}$ in. angles. They are seated on the concrete floor of subway, have bottom flange angles, and they project half-through in roof slab, which is specially reinforced above them by 2in. rods, distributing the column reactions on the concrete. Details are given in the *Engineering Record*. The columns are connected below the roof slab by continuous longitudinal girders of two 12in. channels, and these girders are filled with concrete, which is also moulded round them to form solid reinforced beams integral with the roof slab. The concrete is of Portland cement in proportions of 1 : 2 $\frac{1}{2}$: 5; the outside walls are of cinder of slag concrete 1 : 2 : 6. The bulk of concrete used is made of 100lb. of cement, 2 $\frac{1}{2}$ c.ft. of sand, and 5c.ft. of stone. The floor is composed also of concrete, having three longitudinal inverts between the rows of columns. The whole structure is made to form a compact mass of concrete. Mr. W. S. Twining, C.E., is the chief engineer, and Mr. Chas. M. Mills, C.E., the principal assistant engineer. A great many details of the construction and obstacles met with are given in the *Record*. It will be seen that the tensile stress is taken by the steel rods which are near the soffit of roof slab and the compression by the concrete. The roof is covered by asphaltic mastic. Longitudinal rods, 2in.

diameter, about 6in. apart, are placed near the top of roof slab, which serve to hold the concrete together and to distribute the stresses. The subway will be completed in about two years.

CONCRETE SEWER AT COLDWATER, MICHIGAN.

THE construction of a concrete sewer with a monolithic invert and an arch composed of blocks was described at the annual meeting of the Michigan Society of Engineers. The city of Coldwater, Mich., with a population of 6,216 in 1900, is built upon very flat ground, the streets have never been properly graded, and during the summer of 1901, Messrs. Riggs and Sherman, of Toledo, were engaged to design a trunk sewer to replace an old 18in. tile, which was entirely too small. Bids for this work were asked on three different designs: (1) brick; (2) concrete, with the semicircular invert a monolith 8in. thick and the arch composed of 11 concrete blocks; (3) concrete composed entirely of blocks. These blocks were to be 24in. long, the intrados to conform to the arc of the sewer subtended by a chord 5 $\frac{1}{2}$ in. long, and the extrados to a chord 8in. long. The diameter of the sewer was 42in. The lowest bid for the brick sewer was 340dol. per linear foot, and that for concrete with monolithic invert 3dol., the other bids being rejected. The cost of the concrete was influenced by the fact that Portland cement could be obtained for 1.25dol. per barrel, delivered on the work, and that an excellent gravel was very abundant in the neighbourhood. Mr. Harry V. Gifford, of Bradner, O., was the engineer in charge of construction.

The work of preparing the blocks was started early in September. Some 8,500 were required, and in order to give them as much time as possible to set, the majority of this work was done before excavation on the trench was started. Moulds were made of 2in. lumber, and lined with tin, and the four sides of the mould formed the extrados, intrados, and two ends of the block, the remaining two sides being open, and the whole held together by screws or wedge clamps. The moulds were not at first lined with tin, but after a little use the concrete stuck to the sides when the mould was removed. The mould when put together was laid upon a mould board 1in. by 12in. by 30in., reinforced by cleats across the bottom. When the block was completed, the mould was carefully taken apart, and mould board and block were carried out and laid upon a stretch of sand that had been levelled

SIXTEENTH-CENTURY HALF-TIMBERED HOUSES, STRATFORD-ON-AVON.

THESE houses, which are situated in High-street, have recently undergone considerable alterations necessary for their conversion into business premises and a dwelling-house. The houses date back to the early part of the 16th century, the character of the timbering and remains of Early Renaissance carving on the story-posts being a fine example of the style of the period. The buildings have been much pulled about from time to time, the most important alteration being made some hundred years ago, when the roof was reconstructed in order to add an upper story. In doing this the timbered gables were pulled out, and the work so badly mutilated as to be almost

to receive them. This block was left upon the board until, by careful handling, it could be removed without injuring it. After being removed from the board, it was allowed to remain on the ground for three days, after which it was placed upon the pile. The blocks were watered several times each day for at least a week. Very few blocks were broken, which was rather remarkable, considering their weight of 90lb. each, and the green condition in which they were handled.

A gang of fourteen men was all that could be conveniently worked—two to screen gravel, four to mix concrete, four moulders, three men to shift and water blocks, and one foreman. The work was done in a gravel pit owned by the city, and this materially reduced the cost of the blocks. The contractor did not have to pay for the gravel; but to offset this he afterwards gave the city whatever gravel was needed from the trench. With a little practice each moulder could turn out 175 blocks a day. Each batch of concrete containing one-half barrel of cement would average eighteen blocks. This would make the cost of each block between 11 and 12 cents, figuring 85 cent on each block for use of moulds and mould boards, which were entirely lost. It is Mr. Gifford's belief that it would have been more satisfactory had the blocks been 18in. long instead of 24. Although a man can make a block 24in. long about as quickly as 18in., and it is not necessary to handle as many blocks to build a given distance of arch, yet the greater rapidity and ease with which the smaller blocks can be handled and the decreased liability to break or chip them would offset the advantages of the longer block, from the contractor's standpoint as well as that of the engineer.

The gravel obtained from the bank was of an excellent quality, and very free from clay or other impurities. A stratum of pebbles from which all the sand had been washed ran horizontally through the bank. These pebbles, when caved down and mixed with the gravel beneath, easily balanced whatever surplus of sand occurred in the other gravel. This was all screened through a riddle with meshes 1in. apart. The concrete was mixed in the proportion of 1 part American Portland cement to 6 parts of gravel.

The material encountered in digging the trench was loose clean gravel, with the exception of the bottom foot or two, which in some places was a sandy loam. Every foot had to be sheathed and thoroughly braced, and constant watch kept on the banks even then, for they would crack off in long stretches from 3ft. to 5ft. back of the sheathing. The horizontal method of sheathing was first used, and proved quite disastrous to the contractor, for in driving it down it greatly increased the natural tendencies of the banks to cave. It could not be as readily handled as the vertical form, and after the top part was removed, the banks would cave, making it impossible to get out the lower courses. The vertical method was much more rapid and satisfactory.

When the trenching had reached the approximate grade of the top of the invert, stakes were driven in the bottom about 5ft. or 6ft. apart, in lines a distance each side of the centre line equal to the radius, plus the thickness of the shell, plus 1in. These stakes were driven to such a grade that the top of a 2 by 4 set edgewise upon them would be at the proper grade for the top of the invert. The invert was then excavated to form approximately to the outside of the finished sewer, and afterwards made to conform exactly by a semicircular templet of the proper dimensions, drawn along the runners. Where gravel was found in the bottom, it was impossible to hold the shape exactly; but where loam was found, the excavation could be made perfectly true. Concrete was thrown in, and with shovels and rammers was worked into approximate form without the use of moulds. The only part that was difficult was to get the inside shoulder on both sides to stand up square. This could be accomplished by holding a float or a board along the inside, filling in behind it with concrete and tamping it down. A form was tried in making the invert, built very much like the centre used for arches of brick sewers, except that about one-third of the centre of the arc was left out. This form was about 6ft. in length, and was suspended in an inverted position from cross boards resting upon the runners. The bottom of the invert for about one-third of the semicircle was made to approximate dimensions; the form was then set on the runners over this partially pre-

pared spot, and concrete was filled in on both sides, between the outside of the form and the side of the trench, and thoroughly rammed. The form could then be lifted off and the invert trued up. This gave very good results, the only objection to it being that the form was too large and clumsy, and was in the way of the workmen. It could be used with success in a soil where the excavation could be prepared a number of feet ahead, so that the form could be drawn along as each section was completed; but in soil like that at Coldwater, where the placing of the concrete must closely follow the preparation for the invert, this form was in the way. Either method gave an approximate form to the concrete, which was trued up by means of a semicircular templet with a radius of 21½in. This left the surface of the concrete ½in. larger than the finished invert. While the concrete was yet green, a heavy coat of 1:2 mortar was roughly trowelled on. This in turn was brought to its true dimensions by drawing along the runners a third semicircular templet with a 21in. radius. This left the surface perfectly true, and both concrete and plaster of proper thickness. Smoothing it down with a trowel was tried; but a section thus treated was found to be so far from its true form that the practice was given up after the first day.

When the coat of plaster had become hard, two tiers of blocks were laid up to a line upon each shoulder of the invert. The mortar was composed of 1 part of American Portland cement, 2 parts of sand, and ½ part of slaked-lime plaster. The lime made the mortar so much richer and so much better to work, and the joints were so much better laid, that it fully offset what little weakening effect it had, if any.

The form for the centre was then put in place, and the rest of the arch built up, care being taken to break joints. As each section (about 8ft. in length) was completed, a thin grout of equal parts of cement and sand was poured over the top, and worked into all the joints. Gravel was thrown upon each shoulder of the arch and tamped down, and the centre moved ahead.

CHIPS.

The Bishop of Lincoln on Thursday week opened a new church on the Waterside-road, Barton-on-Humber, in connection with St. Chad's Mission. The church will accommodate 300 persons.

Mr. H. Ross Hooper, Local Government Board inspector, held an inquiry at Pontefract last week into applications by the town council to borrow £154 for works of sewerage in Beech Nut-street; £3,200 for the purchase and pulling down of a house and shop at the corner of Gillygate and the Market-place, for the widening of Gillygate; £500 for the purchase of land at the junction of the Wakefield and Barnsley main roads, upon which a cycle shop and factory have been partly erected by Mr. Ewbank; £107 for improvement in Corn Market, and £195 for the widening of Front-street.

A receiving order has been made, on a creditor's petition, in the Boston County Court, against Herbert Clarke, civil engineer, Boston, the act of bankruptcy being "that the debtor has, with intent to defeat or delay his creditors, departed from his dwelling or has otherwise absented himself." Mr. Jebb and Son, Boston, are the solicitors for the petitioning creditor.

During the progress of the alterations at Durham Castle a series of Norman latrines have been discovered in the north-west turret. Excavations are being made in the hope of discovering the old cells of the original castle.

At the last meeting of the Incorporated Church Building Society grants were made for building new churches:—At Broadheath, near Worcester, £80; St. Anne, Brondesbury, £150; for the first portion, Jarvis Brook, near Tunbridge Wells, £120; and St. Andrew, Southgate, £100; and towards enlarging or otherwise improving the accommodation in the churches at Dale, near Milford Haven; St. Philip, Dalston; Gilestone, near Cardiff; Great Sturton, near Horncastle, Lincoln; Lanteglos-by-Fowey, £40; Llandebie St. Tybie, Carmarthen, £30. Grants were also made from the special mission buildings fund towards building mission churches at Bensham, near Gateshead-on-Tyne, Newlyn, and Newtown St. John, near Beaufort, Mon. In addition to this, the sum of £130 was paid towards the repair of 13 churches from trust funds held by the society.

In Indore, the Sherpur Palace is to be completed as a residence for the young Maharaja, the Rampur Kothi in the Lal Bagh rebuilt in elaborate style, and a new Residency designed and erected. The architect for all these works is Mr. C. F. Stevens, of Bombay.

SKETCHES IN NORMANDY.

THE sketch of Mont St. Michel is made from the eastern bastion, which affords the finest and most comprehensive view of what is undoubtedly one of the most picturesque and romantic spots in the world. The whole island is one massive rock rising sheer out of the sea 257ft., crowned by the abbey, the highest pinnacle of which is 400ft. from sea-level. The massive fortifications all round, the monastic buildings built into the rock on all sides, and the grandeur of La Merveille which stretches along the south side of Mont form a delightful contrast to the choir of the abbey with its forest of delicate pinnacles. The nave of the abbey dates from 1260, and the choir from the end of the 15th century.—Dol Cathedral is one of the smaller and more simple of the French cathedrals. Its simplicity arises from the material of which it is built—namely, the hard granite of the locality. It dates from the 13th century. The sketch shows the large porch of later date attached to the south transept, which is interesting for the massive piers at the corners, also the low square tower over the crossing of the transepts with the nave.

REGD. T. WHEATLY.

OBITUARY.

GEORGE FOSTER SHEPLEY, of the well-known firm of Boston architects—Shepley, Rutan, and Colledge—died July 16 at St. Moritz, Switzerland, where he had gone for the benefit of his health. He was born in St. Louis in 1860. He studied at Washington University, and afterwards, in 1882, was graduated from the Massachusetts Institute of Technology. He entered the office of H. H. Richardson, where he studied until that gentleman's death, and the firm of which he was the head was then formed. Of the many imposing buildings that the firm has designed throughout the country in the succeeding period the following are representative:—The Ames Building, the Chamber of Commerce, South Terminal Station, Back Bay Station, and New Congregational House in Boston; the Art Institute, Chicago; Leland Stanford Junior University, California; and the new union station, Albany. He was a Fellow of the American Institute of Architects.

The Wallasey Council Health Committee have recommended the appointment of Miss Isa Birrell, of Rock Ferry, as female sanitary inspector, at a salary of £70 per annum with uniform, out of 28 applicants for the position.

In January last the Bishop of Carlisle appointed a commission to consider the need for the extension of spiritual provision in Barrow. The commission has now reported, and suggests the building of a new church, to accommodate 600 worshippers, on Walney Island, on a site given by Messrs. Vickers, Sons, and Maxam, adjoining the present church and burial-ground; that the site for a new central church be secured in Abbey-road, at a cost of £4,000, capable of accommodating 1,600 worshippers, and removal of St. Mark's Church to some other part of the parish, and its rebuilding as a separate church; and the securing of the site for a new church on Barrow Island, with a view of building a large church and a convenient mission-room.

In Lichfield Cathedral on Saturday last two memorial windows were dedicated, one in honour of the Staffordshire Yeomen and Volunteers who fell in South Africa and the other to the memory of Lieutenant-Colonel Sir Horatio Page Vance. The Staffordshire window contains figures of Gideon, Moses, and David—Gideon and his companions being represented blowing the trumpets, Moses stretching out his hand over the sea, and David with his sling. The Vance window has figures of St. Oswald, St. George, and St. Alban, accompanied with suitable mottoes.

Immediately below the figure of St. Mildred, the patron saint of Whippingham Parish Church, Isle of Wight, was placed last Friday a memorial tablet containing an inscription in a 14th-century church text letter, of alabaster on a background of ornate gilt, the effect of which is strikingly beautiful. The new reredos is in alabaster. The central panel depicts the Last Supper in white marble, whilst the side panels represent the emblems of bread and wine.

Mr. John Macpherson Grant, Provincial Grand Master of Inverness-shire, laid the foundation-stone of a new Masonic hall for Lodge Fort William No. 43 last week. When the stone had been laid, the Provincial Grand Master said it was 160 years since the foundation-stone of the old Lodge was laid in the High-street of that burgh.

Building Intelligence.

BATTERSEA.—The Battersea Borough Council have completed the erection of over three hundred self-contained dwellings for the working classes, all of two stories high, with accommodation for 1,500 persons, on the Latchmere estate. The new dwellings are destitute of architectural adornment, but will compare favourably with any others of the kind in London. There are a few five-roomed houses to be let at 11s. 6d. per week; 69 containing two three-roomed tenements, with separate entrances, at 7s. 6d.; and 73 containing two four-room tenements, at 10s. and 10s. 6d. per tenement. The council provides water and pays all rates and taxes. The dwellings are lighted throughout by electricity on the "penny-in-the-slot" principle. Each tenement is provided with a combined kitchen range, copper, and bath, including a shower-bath. The windows are fitted with Venetian blinds, and there is a garden to each tenement, accessible from the upper floor by means of a staircase. The main frontage is in Shepcote-lane, opposite the South-Western Railway line.

BLYTH.—New club buildings for the Blyth and District Social Club were opened on Monday from plans prepared by Mr. John Gouling, of Blyth, and the estimated cost is £7,000. They provide on the ground floor a bar-room, a large parlour, and two smaller rooms, together with four bathrooms and the necessary adjuncts. The space on the first floor is utilised in providing a billiard department. Adjoining there is a refreshment bar and games room, and near the stairhead the directors' room. On the second floor there is a large hall for meetings, lectures, and conferences. The news-room and library are also situated on this floor. In addition, the manager's apartments are provided.

BRISTOL.—The new Stock Exchange at Bristol has been opened. The Renaissance style has been adopted. It has a long frontage to Nicholas-street, the central portion of the front elevation for some length projecting beyond the line of the main building. The interior of the premises comprise, on the ground floor, entrance lobby, hall, secretary's office, telephone room, and the main Stock Exchange. The exchange is elaborately furnished, and the walls are lined round with richly-polished walnut panels of a handsome design to a height of about 9ft. In the centre of the wall facing the door is arranged a chimney-piece rising to a height of about 14ft., an arrangement of polished walnut pilasters with arch between, framing a piece of wood sculpture. This panel, which is about 5ft. 6in. wide by 3ft. 6in. high, was carved by Mr. Benjamin Creswick. The title of the panel is "Commerce uniting the Nations." The whole of the walls of the approach and staircase are lined with tiles of special design, whilst the walls of the exchange and library are of oak. The architect of the building is Mr. Henry Williams, and the builders were Messrs. Cowlin and Son.

GLASGOW.—At a sitting of Glasgow Dean of Guild Court last week, the following linings were granted:—The Craigton Brickmaking and Feuing Company (Ltd.), to form a street between Ell-road and Craigton-road; Glasgow East-End Industrial Exhibition Association, to alter and add to the East-End Exhibition; George Riddell, Craigmiller, Dumbreck, to erect tenements in King-street, Calton; William G. Davidson, house factor, 55, Bath-street, to erect seven tenements of dwelling-houses and offices in Oran-street and Percy-street, Maryhill; Glasgow Parish Council, to add to and alter Barnhill Poorhouse; the Corporation of Glasgow, to erect workshops and offices in Stirling-street; Sir John Stirling-Maxwell of Pollok, Bart., to form streets on the lands of Shawlands; James Lindsay, Adzell Lodge, Edinburgh, to form a new street from Winton Drive; J. and T. McNair (Ltd.), 59, Bath-street, to form two streets off Gourlay-street, Springburn; also to erect five tenements of dwelling-houses on a new street off Gourlay-street; Angus Murray, engineer, Strathroy, Dumbreck, for the Anderson Foundry Company, Craigton, to erect engineering works on the south side of Craigton-road; John Maxwell, builder, Maryhill, to erect five tenements of dwelling-houses at Crosbie-street, Maryhill; John Nisbet, architect, 112, Bath-street, to erect 21 tenements of dwelling-houses in Shakespeare-street and New-street, Maryhill; Peter Galloway, tailor, Glasgow, to erect six lodgings on the west side of

Montgomerie-terrace and Prospecthill-road; Mrs. Mary Watson, 317, Onslow-drive, and another, to erect two tenements of shops and dwelling-houses in Great Eastern-road.

LIVERPOOL.—Lord Derby, on Wednesday afternoon, laid the foundation-stone of a new building to take the place of the present Liverpool Bluecoat Hospital, an institution which has been in existence for nearly two centuries, and which is Liverpool's oldest charity. The new hospital is to be erected in the Late Renaissance style. It will be built of red brick, with facings of white stone, and accommodation will be provided for 250 boys and 150 girls. The site covers nearly seven-and-a-half acres. A prominent feature of the building will be a central tower, 125ft. in height, supporting a public clock and bells. The new hospital is to cost £65,000. The architects are Messrs. Briggs and Wolstenholme, F. B. Hobbs, and Arnold Thorneley, of Liverpool. We illustrated and described the building in our issue of June 26.

NORTHALLERTON.—The foundation-stone of the new hall for the North Riding County Council, which is to be erected at a total cost of about £40,000, was laid last week at Northallerton. Mr. Walter H. Brierley, of 13, Lendal, York, is the architect; and Messrs. Jos. Howe and Son, West Hartlepool, the contractors. The buildings are to be erected in the field opposite Northallerton Railway Station. The front, facing the main road, will be about 200ft., and will consist of a central block with projecting wings set back about 200ft. from the main road. The elevations are designed in a quiet, dignified English Renaissance style, the materials being of common local brick, with bright Leicester bricks for the facings, and Whitby or Farndale stone for the dressings.

ROCHDALE.—At last week's meeting of the Rochdale Town Council, the Buildings and Sites Sub-committee reported that they had resolved to employ Messrs. Smith and Cross, South Parade; E. Sykes, Milnrow-road; and T. Townsend, District Bank-chambers, to prepare a ground plan of each of the non-provided schools, subject to terms to be arranged later. It was also resolved that the offers of the following architects to prepare plans and report on the condition of the voluntary schools named below be accepted:—Mr. E. Sykes: Parish church (mixed), parish church (infants), St. Alban's (mixed), St. Alban's (infants), St. Edmund's, Oakenrod, and All Saints. Mr. T. Townsend, jun.: St. Mary's National, St. Peter's, Healey; St. Edward's, Castleton; St. John's, R.C. (mixed), and St. John's, R.C. (infants). Messrs. Smith and Cross: St. Mary's, Balderstone; St. Martin's, Castleton; St. James's, Thornham; St. Patrick's, R.C.; St. Gabriel's, R.C.; and Trinity Wesleyan. Payments to the architects are to be at the rate of 25 guineas for six schools.

WHELOCK.—The foundation stone of the new church which is being added to Wheelock Parish Church was laid on Tuesday week. The church is to be 25ft. long by 19ft. wide, and at the side will be a choir vestry and an organ chamber. The church will be divided from the nave by an oak screen. Seven steps will lead from the body of the church to the altar table, which will be fitted with an oaken rail and brass standards. The choir stalls are also to be of oak. The architect is Mr. A. Price, of Elworth, and the contract has been placed with Messrs. Birchall, of Middlewich. The cost will be about £500.

The Italian Minister of Public Works invites tenders in Italy and from abroad for the building of an aqueduct to provide the arid Apulian plains with water from the Apennines. There will be one main duct over one hundred and fifty miles long. The total length of main and branch ducts will be one thousand and seventy miles. The constructor will enjoy a concession of the supply for ninety years, the State providing an annual subsidy of £200,000 for twenty-five years.

The tender of Mr. Colin Macandrew, builder, Lauriston Gardens, Edinburgh, has been accepted for the execution of the whole of the works in connection with an extensive reconstruction of the barracks and other buildings at Leith Fort. The plans have been prepared by the War Office authorities, and it is understood that the total expenditure will amount to about £40,000.

Teignmouth Urban Council decided on Tuesday to apply to the Local Government Board for permission to borrow £2,000 for the purchase of slot meters and gas stoves.

PARLIAMENTARY NOTES.

WESTMINSTER ABBEY.—Mr. Channing asked the honourable member for West Derbyshire, as representing the First Commissioner of Works, on Monday, whether he had considered the proposals of the Ecclesiastical Commissioners to demolish the old residential quarter immediately south of Westminster Abbey and Deanery Garden, with a view of selling the sites for important commercial buildings; and whether, having regard to the undesirability and risk of erecting lofty buildings close to the Abbey, his Majesty's Government would make representations to the Ecclesiastical Commissioners or take other steps to prevent this proposal from being carried out. Mr. V. Cavendish: This is a matter which does not come within the jurisdiction of the First Commissioner of Works; but he would strongly deprecate any building scheme which would impair the safety or amenity of the Abbey. Mr. Channing: Has the First Commissioner no power over the height of buildings? Mr. Cavendish: No, sir, I am afraid we have no power.

WATER SUPPLY AND SANITARY MATTERS.

PADSTOW.—On Monday Padstow Waterworks were officially opened. The contracts, amounting to about £4,000, for carrying out the work were signed last November, and the agreement stated that everything should be completed by June 1, but, owing to one contractor, there was some delay, and the work was not commenced until early in the year. The new supply will be drawn from Crack-rattle, a distance of about 5½ miles. Here an adit has been driven, and the water is brought in by 5in. pipes to a reservoir at Four Turnings, which is half a mile from the town. The supply from which the water is taken has been measured at different times, and during a very dry season the smallest flow per day was 62,640 gallons. The work of trenching and laying pipes has been carried out by Mr. W. E. Bennett, contractor, Plymouth, Messrs. Merryweather being the engineers, and Mr. W. Johnson clerk of the works.

OHIPS.

At a joint meeting of the Launceston Town Council and Coronation Executive Committee on Friday, the mayor (Mr. C. B. Shaker) presiding, it was decided to erect a bungalow on the Windmill as a memorial of the Coronation.

The Egyptian Ministry of Public Works invites tenders for the construction of three road bridges over the Nile at Cairo, in accordance with the specification which may be seen in the offices of the Administrative Service of the Ministry (in London, at the Commercial Intelligence Branch of the Board of Trade, 50, Parliament-street, S.W.). No tenders will be accepted which are received later than noon on February 1, 1904. Every tender must be accompanied by the deposit, either in bonds of the Egyptian debt or in cash, of a sum of £E2,000 (about £2,031).

The King has granted to Mr. Frederick Eugene Scholer his authority to accept and wear the Insignia of Knight (Second Class) of the Order of Frederick, conferred upon him by the King of Wurtemberg, in recognition of his services as architect of the Garrison Church at Ludwigsburg.

Great regret has been expressed at the news of the death of Mr. Walter Ingram, the sculptor engaged upon the memorial to Lady Jerningham, for Berwick-upon-Tweed.

It is intended to erect new premises to replace the present Stepney Temple, so well known to Wesleyans throughout the world. A central hall is to be built with seating accommodation for 2,169 persons, school-rooms are to be erected, and residences are to be provided for ministers. The total cost is estimated at £50,000.

One of the centre windows in the north aisle of Godmanchester Parish Church has been filled with stained glass, to the memory of the late Bishop McDougall, one of the former vicars of this parish. It is a three-light window, divided into two compartments, and the upper portion is symbolical of the work of the Bishop in foreign parts. The centre lights contain a figure of Christ, and the two side ones show groups of natives receiving Christian teaching. The three bottom lights represent the mission work of Paul and Barnabas.

A new room for the Congregation Sunday School has been opened at Shipdham, Norfolk. The building has been erected by Mr. Goss, of Shipdham, from plans of Mr. Whiting, of Dereham, the style of the adjoining chapel being copied.

At a meeting of the Berwick Town Council on Tuesday offers were accepted for the repair of several of the arches of the old bridge, which, it is stated, are being undermined, the work to cost £156. It was also agreed to repair the footpath on the bridge at a cost of £250.

Our Illustrations.

PASSMORE EDWARDS SAULERS' PALACE, LONDON, E. We to-day illustrate the principal entrance to "Jack's Palace," erected largely at the cost of Mr. J. Passmore Edwards. The cartoon for the carving was done by Mr. H. Wilson, the carver was Mr. M. Murphy, and the cast lead panels in the fronts were executed by Mr. Hunt, of Hoddesdon. Messrs. Niven and Wigglesworth were the architects. We illustrated a general view of the building in our pages for Jan. 3, 1902, when a description of the work appeared. The Palace was opened a few weeks since, and is now in use.

GOVANHILL LIBRARY, GLASGOW.

We publish to-day the plans of Govanhill Library, Glasgow, won in open competition in September last by Mr. J. R. Rhind, architect, Inverness. Mr. Horatio K. Bromhead, F.R.I.B.A., President of the Glasgow Institute of Architects, was the referee. On this occasion four libraries in different districts of Glasgow were competed for, and Mr. Rhind was successful in winning three of them. He was also successful in May last in the competition for the Dennistoun District Library in the same city. Dr. Andrew Carnegie gave £100,000 to Glasgow to build libraries, and as only about half that sum has been so far apportioned, there remains yet £50,000 to be expended in libraries in Glasgow.

SIXTEENTH-CENTURY HALF-TIMBERED HOUSES, STRATFORD-ON-AVON.

(For description and further sketches see p. 169.)

LIVERPOOL CATHEDRAL.

We have now, with this plate, given all the leading general drawings of Mr. Nicholson's design for this building, and we think it will be considered a very notable scheme in many ways. Like Mr. Tapper, we understand that Mr. Nicholson has worked under Mr. Bodley, and so carries out the traditions of a good school of Gothic design as realised for modern church architecture. Naturally the proposals of these gentlemen were likely to be considered worthy of recognition, and it may certainly be said that they realised what was anticipated in this respect. We illustrate Mr. Nicholson's elevation towards St. James's Mount; a section through the baptistery and nave; also two other sections—one of the choir and one across the lantern.

HOUSE AT WARRLINGHAM.

This house is erected on the southern slope of the range of hills overlooking Marden Park and the Woldingham Valley for Mr. A. L. Pike. The

chief feature of the plan is an oak-panelled sitting-hall, with heavy oak beams across the ceiling, and a large billiard-room adjoining, the principal rooms being designed to get the views of the surrounding country. The house has been erected by Mr. J. Quittenton, builder, of Warrlingham, from the designs of Mr. W. H. Harrison, F.R.I.B.A., of 66, Victoria-street, Westminster.

ST. MARGARET'S, TOLL-CROSS, NEAR GLASGOW.

The accommodation of this church is for 322. The cost is £2,203 exclusive of fees, but inclusive of all else. A local red sandstone is used inside and out; interior walls rough two-coat plaster and stone dressings. The roofs are white pine, and covered with Peck's tiles. The finishings are yellow pine; choir steps and pulpit of stone. The font is placed in the jamb of the choir, by request. The details of screens and stalls are exceedingly simple, and the pulpit is merely composed of two or three courses of ashlar enriched by a text. At a small outlay I tried to touch up the gasfittings and make them look interesting. That, with a few texts on the greenish stained woodwork in white, is all the decoration I had money for.

W. G. ROWAN, Architect.

EDINBURGH ARCHITECTURAL ASSOCIATION: FIRST PRIZE DESIGN FOR A SCHOOL OF ART.

The two plans and section, with the accompanying elevation, of a design for a School of Art won the first place in a students' competition recently, as above. Mr. John McIntyre, of Edinburgh, is the author. The drawings are so clearly shown that the design needs no further description.

COMPETITIONS.

BLACKPOOL.—The awards in the picture-poster competition were made last week by the Advertising Committee of Blackpool Corporation. Ninety-two designs were sent in from all parts of the world, and the committee awarded the four prizes as follows:—£100 to Messrs. Kiteat Brothers, of Hulme, and Wilson, London, for a picture of children building sand castles on the sea shore; £50 to Hans Deiter, of Dusseldorf, for an allegorical picture of three females representing Health, Pleasure, and Music floating over Blackpool; £30 to Robert Paton Brown, of Bradford, for a poster showing a gentleman and lady in holiday attire gazing at a distant view of Blackpool; and £20 for a picture view of Blackpool, by Messrs. Hargreaves and Wilson, of Blackpool.

FLAMBOROUGH.—The competition for the best scheme for the water supply of Flamborough has resulted in the plans of Messrs. Elliott and Brown, of Nottingham, being adopted. Fourteen schemes were submitted.

CHIPS.

On Wednesday week, the Bishop of Gloucester reopened the ancient parish church of Lower Guiting, Cheltenham, and dedicated the new work. The church contains some interesting Norman as well as later work. A sum of £2,600 has been raised, with which the work of repair was put in hand. This involved the rebuilding of the chancel (with the exception of the priest's doorway), the re-roofing of nave and transepts, and the construction of a vestry and organ-chamber. Various special gifts have been made, including a stone pulpit, a lectern, stained-glass windows, and altar furniture.

The Rochdale Unitarian church was reopened on Sunday after improvements. Messrs. W. H. Best's scheme of decoration was specially made as simple as possible in order not to take away from the richness of the windows and the carved work, which are the glory of the church. The walls are left severely plain, only a few bands being introduced to emphasise the architectural features.

Under its compulsory powers the London County Council has acquired The Rookery, Clapham Common, a small plot of land with an area of 9,460ft., with an old house and buildings, occupied for many years by a veterinary surgeon. The price to be paid is £5,100, being at the rate of over £23,500 per acre.

The International Society of Sculptors, Painters, and Gravers has been invited to arrange the British fine art section of the Dusseldorf International Exhibition, to be held in that city next year. The council has accepted the invitation, and Mr. A. Neven Du Mont has been appointed delegate by the Dusseldorf Exhibition directors, and also representative of the International Society.

PROFESSIONAL AND TRADE SOCIETIES.

CHARD, SOMERSET.—The fifty-fifth annual meeting of the Somerset Archaeologists' Society was held at Chard last week, the proceedings commencing on Tuesday. The Very Rev. the Dean of Wells vacated the chair, and installed as his successor Mr. F. J. Fry, of Cricket St. Thomas. The President delivered an interesting address, in which he alluded to the antiquities of Rome and Egypt, and concluded with some local references, in which he said that Chard had many historical local references, those connected with Charles I., "King" Monmouth, and Charles II. Charles I. was twice in Chard, and the town had bitterly to rue the day when, in 1685, Monmouth marched through Chard, for did not Jeffreys hang some twelve or more of its citizens after the "bloody assize"? The members afterwards partook of luncheon in the Corn Exchange. At the conclusion a visit was made to the parish church, Grammar School, and the old manor, or court-house, on the Cornhill. In the afternoon the members proceeded to Membury, where there are the remains of an ancient British fortress, and from which other similar places of defence can be seen. The parish church of Membury was one of great antiquarian interest, and its features were explained by the rector, the Rev. F. E. W. Landon. At the evening meeting, a paper written by Sir Edward Fry, a vice-president of the society, was read by the Rev. W. Weaver, in Mr. Fry's absence, the subject being "Somerset, or Somersetshire," and a discussion followed. Mr. Weaver gave some interesting particulars of the town of Chard. On Wednesday the programme included a drive to Whitestanton, where members visited the church and the Manor House, the residence of Commander Elton, R.N., in the grounds of which there is a site for a Roman villa. From here the members went to Castle Neroche, and inspected the ancient British camp, where the owner, Viscount Portman, has recently allowed extensive excavations to be made with a view to arriving at the approximate date of its formation. Ilminster was reached about two o'clock, and after luncheon at the George Hotel a visit was paid to the parish church.

KENT ARCHEOLOGICAL SOCIETY.—The annual meeting of the Kent Archaeological Society was commenced on Monday week at Rochester. Earl Stanhope presided at the meeting and dinner. The customary evening meeting was held in the Corn Exchange, papers being read by Archdeacon Cheetham and Mr. G. Payne, the former dealing with "Archbishop William de Corbeil's connection with Rochester," and the latter with "The Archaeology of the Rochester District." The second day was devoted to a tour through the Hundred of Hoo, the places visited being Cliffe, Cooling, High Halstow, Stoke, and Hoo St. Werburgh.

MANCHESTER SOCIETY OF ARCHITECTS.—On Saturday, July 25, the members of this society visited Bournville, near Birmingham, Messrs. Cadbury's model village. Mr. W. A. Harvey, the architect, kindly met the party, and showed them over a considerable part of this most interesting estate. Several houses were examined throughout, and the nearly-completed Ruskin Hall was much admired. It was thought that the great success, both social and architectural, of this experiment should do much to encourage similar schemes elsewhere. The fine church of St. Agatha, Birmingham, was then visited under the guidance of Mr. Bidlake, the architect; and also Messrs. Keep's warehouse, a refined piece of work by the same architect. The day was concluded by a visit to the Eagle Insurance Co.'s offices (Messrs. Lethaby and Ball, architects), where the interior, with its beautiful marble and plaster work, was especially admired. Some of Mr. Edgar Wood's work at Middleton was visited on Tuesday evening, July 28, by 20 members. The Old-road Chapel has been lately decorated by the architect, and Mr. Jackson, the painter, and has a charming internal effect of rich colouring. The new Wesleyan chapel is an excellent piece of grouping, arranged picturesquely round a cloister or courtyard. Mr. Wood's own house is full of interest, and the formal garden he is developing shows what good results can be got on a very small scale.

A new drill hall was opened at West Bromwich on Saturday last. Mr. E. Wood is the architect, and the cost about £1,000.

LEGAL INTELLIGENCE.

A DEBTOR WITH A SURPLUS.—At Stockton Bankruptcy-court, John Cooper, plasterer and builders' merchant, of Stockton, appeared last week for his first public examination. He said his liabilities were £1,601, and he did not know until after he filed his petition that there was a surplus of £1,049 4s. 6d. He owed to unsecured creditors £300, and his estate was worth £1,350. He was overdrawn at the bank to the amount of £1,298 17s. 7d., for which the bank held deeds of property valued at £2,100 as security. The examination was adjourned.

MORE SLANDER AT TAMWORTH.—DISTRICT SURVEYOR SUES DEPUTY MAYOR.—At the Birmingham Assizes last week, before Mr. Justice Ridley, an action was heard, brought by Henry John Clarkson, surveyor of the Tamworth Rural District Council (formerly borough surveyor), against Frederick George Allton, provision dealer, Deputy-Mayor of Tamworth, and a member of the rural district council, for slander. Mr. Hugo Young, K.C., and Mr. H. H. McCardie (instructed by Mr. Barnes, Lichfield) appeared for plaintiff; and Mr. R. H. Amphlett, K.C., and Mr. F. W. Sherwood (instructed by Mr. Watson) for the defendant. In his opening statement, Mr. Hugo Young stated that the necessity for these continued actions was the existence of a clique headed by Mr. Alldritt, the present Mayor, which had for some years persistently persecuted Mr. Clarkson, and alleged all sorts of things against him. Out of previous actions the plaintiff had always come victorious, and on each occasion the jury had said there was no justification for the attacks made upon him, which had made his life at Tamworth a regular burden. Mr. Hugo Young traced at some length the formation of the Ratepayers' Association at Tamworth, the head of which was Mr. Alldritt, with the defendant, his lieutenant and henchman. The object of this association, he said, was to return to the town council adherents of Mr. Alldritt, and so get a majority for this gentleman. Mr. Alldritt and his friends were successful at the 1901 November election, and one of the first actions of the council was to give Mr. Clarkson three months' notice terminating his engagement. The first of two slanders complained of on the present occasion was alleged to have been spoken at a complimentary dinner given to Mr. Alldritt on January 15, 1902, to celebrate the success of the Ratepayers' Association. Counsel read from the local Press lengthy extracts from a speech made on that occasion by Mr. Alldritt, a master, as Mr. Young suggested, of violent language. One of the statements used was—"We have managed to get rid of the services of one of the most undesirable officials it was ever the lot of any municipality to possess." Later Mr. Alldritt said: "On November 1 last whoever can remember a more scandalous proceeding than the borough surveyor of this town, and actually members of his own family party, himself using his skilful lying tongue to depreciate and defame honest men who were trying to get into the council. He was bribing the community in every direction." For these and other slanders, counsel went on to say, Mr. Clarkson brought an action in which Mr. Alldritt pleaded that the statements were true, and brought no fewer than 51 charges of misconduct. All these were thoroughly sifted, and Mr. Alldritt was ordered to pay £100 damages. On Oct. 22, 1902, at another complimentary dinner to Mr. Alldritt, the latter made another speech in which the following sentences occurred:—"If he (Mr. Alldritt) had not been more guarded in regard to certain matters which had been made known to him only in a degree which was yet insufficient to bring them thoroughly home, he could have proved to them that anything he had yet said only touched the fringe of the most abominable life (meaning, it was contended, the life of the plaintiff) that was ever connected with any municipality in the world. If they could only get an investigation into the various books of the different public bodies in the neighbourhood, a state of things would be revealed which, to use a Krugerian phrase, would absolutely stagger humanity." At that meeting the defendant was present, and called out "It is true!"—thereby adopting, as Mr. Hugo Young contended, all the slanders uttered by Mr. Alldritt. For these slanders the Mayor himself was sued at the last Assizes, and agreed to pay a further £100 damages. An injunction was also granted restraining him from repeating the statements. The second slander was alleged to have been spoken at a meeting of the rural district council on December 20, 1902, in which the defendant referred to an account paid to Mr. J. Morris, of Hurley, of £5 18s. on November 15, 1899, in which beer supplied to workmen was charged as bricks and mortar and was initiated by the surveyor. The explanation of this, said counsel, was that a number of men employed on sewage works declined to continue working unless they had beer, and by Mr. Clarkson's instructions it was supplied by Mr. Morris, who also supplied bricks. A difficulty arose as to whether the account for beer would pass the auditor, and on the suggestion of a clerk Morris made out another account in which the amount due was all charged as bricks. This account, with others, was put before Mr. Clarkson, who, no doubt under the

impression that it had been checked by his clerk, initialled it. This matter was thoroughly threshed out at the hearing of the last action, yet the defendant, knowing Mr. Clarkson's explanation and that he had been acquitted of anything dishonourable, although it might have been irregular, made the charge again in a way to create a wrong impression. Defendant had also made certain improper suggestions against Mr. Clarkson in relation to his performance of certain work on behalf of the trustees of the Shuttington School. After evidence, and the reply of defendant's counsel, his Lordship having summed up, the jury found, in regard to the first slander, a verdict for the plaintiff for £10. The foreman stated that in reference to the second slander, the majority of the jury were of opinion that it was not malicious, and therefore privileged. The question of costs then formed the subject of argument. Mr. Amphlett contended that on the finding he was entitled to the second issue, and therefore at least to a portion of the costs. This matter was, however, reserved for further argument. Mr. McCardie applied for an injunction restraining the defendant from repeating the statements; but on the defendant giving an undertaking not to utter them again, his Lordship expressed the opinion that this would meet the requirements of the case. Mr. Amphlett asked his Lordship to stay execution in view of the possibility of appeal, but the application was declined. Mr. Justice Ridley observing: "There has been quite enough slander from Tamworth, and I hope to put an end to all this litigation. I shall not give you any stay, in the hope that this will end the whole matter. There is plenty of room for municipal life and enterprise without scandal."

BUILDING BY-LAWS.—Robert Harbottle, builder, was summoned at the Most Hall Police-court last Saturday on a charge of having contravened the by-laws of the Walker Urban District Council. Mr. Newlands, who prosecuted, said the defendant presented plans some time ago of an intended new building, and in the notice which accompanied these plans he stated that the external, party, and cross walls would be 14in. and 9in. thick. He proceeded with his building, and at the time he commenced there was already on each side of the site an existing building, the gable walls of which he intended to use. These walls were 9in., and they were a certain height. Defendant, however, determined to carry his building higher than the adjoining building, and, in order to do that, he ought to have continued the 9in. wall on each side at the same thickness. What he did instead was to carry up the new part of these walls at a thickness of 4½in. instead of 9in. In January last, proceedings were taken against him in that Court, and the justices then dealt with the case. He was then fined, and the understanding was that he would put it right by an arrangement with the adjoining owner. But, instead of doing that, he had built against it another 4½in. wall, and had supported it by a batten resting at one side against a flue. The offences against the by-laws were that this wall had not a proper "footing," and that "bond" timber had been used in the wall. The by-laws were for the purpose of insuring safety, and he would call evidence to show that the building in its present condition was unsafe. Evidence was given by Mr. T. W. Lycock and Mr. J. P. Spencer. On the suggestion of the Chairman (Mr. Wigham Richardson) it was agreed between the parties that the case should stand adjourned for two months, to allow of the defendant putting an iron girder on the level of the old wall. It was agreed in that event that, if the work was satisfactory, the summonses would be withdrawn, each side paying their own costs. The Chairman accepted the task of seeing the work was done satisfactorily, and intimated to the defendant that he had chosen a very particular inspector.

A WALL AND A QUESTION OF RIGHT.—John Lockwood, Underbank, Holmfirth, brought an action at Leeds Assizes, on Tuesday, to claim £95 8s. damages for breach of agreement and trespass from the West Riding County Council and others. Mr. Waugh appeared for the plaintiff, and Mr. J. A. Compston represented the defendants. The case was tried without a jury. It was stated by Mr. Waugh that plaintiff was owner in fee of certain premises, consisting of two houses, in the Dunford-road. The premises were erected 60 years ago, and in their construction use had been made of the wall of the main road for support. This wall had got out of repair, and the county council had pulled down part of the plaintiff's property in order to make it good. The view taken by the county council was that plaintiff was responsible for the repair of the retaining wall. The wall in question had been pulled down and set back about 4ft. Mr. Justice Phillimore assumed up the situation by saying that plaintiff had consented to the county council pulling down the house abutting on the wall on the council agreeing to rebuild without expense to the plaintiff. The building was pulled down, when a third party, the district council, stepped in, and claimed the right to interfere with the frontage, and upon that the county council refused to rebuild until

plaintiff had settled with the district council. Now the county council could not throw up their agreement without the plaintiff's consent, or the existence of some law rendering it illegal for them to carry out such agreement. His Lordship held that plaintiff had not released the defendants, and that the county council had failed to show that the district council possessed powers preventing them from carrying out their agreement. His Lordship then heard evidence on the question of damages. Judgment for £75 8s., with costs, was ultimately given. Mr. Compston asked for a stay of execution, as it was an important case for his clients, who might take it to another court. This was granted under terms.

CHIPS.

The church of St. Mary, Black Torrington, was reopened on Thursday week after restoration. The church is an ancient one, dating from the latter half of the 14th century, and was originally cruciform, but later alterations and additions have effaced this feature, and the present tower, built in the 16th century, stands at the west end of the nave. Among other "finds" during the progress of the work was that of the parish stocks, which were discovered hidden away in the roof. The funds raised for the work amounted to £1,333, and an additional £500 is required.

The building committee of the Rochdale Corporation have, during the past month, approved plans for the erection of nearly 250 new houses in the borough. Of these 195 are to be built at Deepdish. A joint conference of representatives from the building, waterworks, and health committees is to consider the type of water-closet to be adopted in the borough. The Local Government Board have intimated their sanction to the borrowing of £2,350 and £650 for the extension of the sewage disposal works at Trub, Castleton Moor.

The Bishop of Salisbury reopened Ramsbury Church on July 27, on completion of its restoration at a total cost of £7,000 to £8,000, the last portion being some oak benches costing about £1,000. The church is an ancient one, and the work of restoration has been spread over about thirteen years.

Messrs. E. H. Shorland and Brother, of Manchester, have just supplied the patent warm air ventilating Manchester grates to the Clifton-street Schools, Swindon.

Exhaustive tests seem to show that sulphate of aluminium is one of the best fireproofing substances for wood, as it checks combustion by forming an infusible and non-conducting coating, while such substances as ammonium sulphate or ammonium phosphate when heated check combustion by emitting an incombustible gas.

The foundation-stone of a new Sunday-school building for the Congregational body at Teignmouth was laid last week. Mr. J. J. Hayman is the contractor, and he will work from the designs of Messrs. Bridgman and Bridgman, of Torquay and Paignton. The building is to consist of a main hall, 26ft. by 3½ft., and six large classrooms, affording accommodation for some 400 children.

At the meeting of the Wolverhampton Board of Guardians last Friday it was stated that the fees paid to Mr. Marshall, of Nottingham, the architect for the new workhouse, have been: As architect £6,585, and as quantity surveyor £1,656; total £8,241.

The Westminster City Council have adopted a recommendation of the Improvements Committee to contribute £40,000 towards the cost of widening Piccadilly from Sackville-street to Piccadilly-circus, which the County Council decided to undertake at its last meeting, as reported last week, subject to the Council contributing a fifth of the cost. An amendment in favour of contributing £20,000 was lost.

The extension of Glasgow University buildings is likely to cost about £90,000. Estimates amounting to £67,000 have been accepted; but these are exclusive of the internal fittings and furnishings of the new buildings, which, it is expected, will probably entail a further expenditure of £20,000.

The inhabitants of Ropley, Hants, are placing a new clock with two large dials, from the design and plans of Lord Grimthorpe, in the tower of their parish church, and striking hours on large bell. Messrs. Wm. Potts and Sons, clock manufacturers, Leeds, have the work well in hand. They are also making a large clock for the parish church, Kirkby-in-Furness, Lancs, for Mrs. Todd-Newcomb in the memory of the late Mr. Todd-Newcomb, which will show the time on large bronze dials and strike the hours on large bell, from Lord Grimthorpe's designs and plans.

The Manchester City Council on Wednesday last approved the sale of the old town-hall site in the centre of the city. The site contains about 1,500 square yards of land, and it was bought by Messrs. Charles Heathcote and Sons, architects, at £110 a yard for a banking company.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the BUILDING NEWS, Clement's House, Clement's Inn Passage, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to THE STRANO NEWSPAPER COMPANY, LIMITED.

Telegraphic Address:—"Timeserver, London."
Telephone No. 1633 Holborn.

NOTICE.

Bound copies of Vol. LXXXIII. are now ready, and should be ordered early (price 12s. each, by post 12s. 6d.), as only a limited number are done up. A few bound volumes of Vols. XXXIX., XL., XLVI., XLVII., XLVIII., XLIX., L., LII., LIII., LIX., LX., LXI., LXII., LXIII., LXIV., LXV., LXVI., LXVII., LXVIII., LXIX., LXX., LXXI., LXXII., LXXIII., LXXIV., LXXV., LXXVI., LXXVII., LXXIX., LXXX., LXXXI., and LXXXII. may still be obtained at the same price; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

Handsome Cloth Cases for Binding the BUILDING NEWS, price 2s., post free 2s. 4d., can be obtained from any Newsagent, or from the Publisher, Clement's House, Clement's Inn Passage, Strand, London, W.C.

TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 6d. (or 6dols. 30c. gold). To France or Belgium, £1 6s. 6d. (or 33fr. 30c.). To India, £1 6s. 6d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 6d.

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of eight words, the first line counting as two, the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except situation advertisements) is 6d. per line of eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Situations and Partnerships.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" and "Partnerships" is ONE SHILLING FOR TWENTY-FOUR WORDS, and sixpence for every eight words after. All Situation Advertisements must be prepaid.

*Replies to advertisements can be received at the office, Clement's House, Clement's Inn Passage, Strand, W.C., free of charge. If to be forwarded under cover to advertiser an extra charge of sixpence is made. (See notice at head of "Situations.")

Rates for Trade Advertisements on front page, and special and other positions, can be obtained on application to the Publisher.

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page advertisements and alterations in serial advertisements must reach the office by Tuesday morning to secure insertion.

RECEIVED.—B. R.—Bodanza.—W. R. and Co.—M. J. R.—W. Condor.—S. B. W.—J. Manners.

Correspondence.

PUBLIC LIBRARY, BROMLEY, E.

To the Editor of the BUILDING NEWS.

Sir,—The Competition Reform Committee approves of the existing conditions of the above, but is endeavouring to obtain a revision of the same.

Reason: No independent assessor.

Architects are requested to abstain from competing unless they receive a further communication to the effect that the conditions have been satisfactorily revised.—I am, &c.,

HENRY A. SAUL, Hon. Sec.

10, Gray's Inn-square, London, W.C., Aug. 1.

COMPETITION FOR PROPOSED SCHOOL, NEW BROMPTON.

Sir,—The committee of the Competition Reform Society disapproves of the existing conditions of the above, but is endeavouring to obtain a revision of the same.

Reasons: No independent assessor.

Readers are requested to abstain from com-

peting unless they receive a further communication to the effect that the conditions have been satisfactorily revised.

N.B.—Members are requested to send to the Hon. Sec. particulars of any open competition which may from time to time come to their notice, and which may not have been advertised in the building papers.—I am, &c.,

HENRY A. SAUL, Hon. Sec.

10, Gray's Inn Square, London, W.C., Aug. 4.

ALL HALLOWS', EXETER.

Sir,—Mr. Read, of Exeter, whose Christian name happens to be the patronymic of a prominent West-country architect, can easily blame other people if, in so doing, he sometimes causes trifling confusion.

Still, the fact remains that Mr. Edward Hall-Harbotte, F.R.I.B.A., of this city, and of Bridge Hill, Topsham, worthily holds the appointment here of Cathedral and Diocesan Architect and Surveyor. As a matter of fact, he not only is so now, but did so years before Mr. Harbotte Read (with or without the "E") had ever been heard of in these parts.—I am, &c.,

Exeter, Aug. 1.

EXON.

Intercommunication.

REPLIES.

[11995].—Tree and Foundations.—None, I should say; lateral roots being cut off. There are thousands of dwellings under similar circumstances all about—REGENCY PARK.

CHIPS.

The Newcastle-under-Lyme Town Council last week resolved that Mr. Wilcox's estimates for the amended scheme for the sewage disposal works, amounting to £20,325, be approved and adopted, and that the town clerk be instructed to make an amended application to the Local Government Board for their sanction to the borrowing of the sum of £25,800, being the estimated cost of the proposed works.

A new ambulance station has been opened at Ipswich. The builder was Mr. G. B. Berry, 311, Woodbridge-road. There is a spacious drill-room, 41ft. by 33ft., and an adjoining classroom, 25ft. by 33ft. The larger building is a corrugated iron building, matchboarded inside, and supported by iron principals, designed by Messrs. Cocksedge and Co. There are the necessary lavatories, &c., and at the back is a good drill-ground, about 150ft. by 25ft.

Last week the Bishop of the diocese reopened the parish church of Lower Guiting, near Cheltenham, and dedicated the restoration work which has been recently carried out, and a combined vestry and organ chamber which has been added at an outlay of about £2,600. The whole of the chancel, with the exception of the priests' doorway, has been taken down and rebuilt, and the nave and transepts have received new roofs and been otherwise renovated, while a vestry and organ chamber have been built over the heating chamber.

Adjoining the hotel at Shirley, Hants, a commodious hall has been erected, with seating accommodation for nearly 400 people, adapted to the purposes of a concert, public meeting, or dinner. Designed by Mr. A. A. Burnett, F.S.I., the building has been constructed by Mr. Henry Cawte, of Shirley. The hall is 36ft. wide by 53½ long, with stage, two dressing-rooms, ladies' and gentlemen's cloak-rooms, vestibule, and refreshment-room.

The Ramsgate Royal Sailors' Rest and Bethel will be completed about October next. The entire cost will be some £8,000, towards which £3,700 has, within some fifteen months, already been given and promised.

The construction of the long-talked-of Tenterden Railway has commenced. A considerable quantity of fencing has been done, and contractors' rails have been laid. The railway will bring the place in direct communication with Tenterden, Robertsbridge, and Hastings.

Lord Balfour of Burleigh will perform the ceremony of laying the memorial-stone of the technical school now being erected through the efforts of the Duchess of Sutherland at Drummie, near Golspie, on Tuesday, September 8.

Cornell University has established an alternative course in architecture leading to the degree of Bachelor of Architecture, from which physics, chemistry, geology and botany, and the higher mathematics are excluded, the change being made in pursuance of the belief of the trustees that some students will receive greater benefit from devoting the time thus saved to practice in design than in application to uncongenial science.

Our Office Table.

THE Public Buildings Bill, now before the House of Commons, authorises the issue out of the Consolidated Fund of £1,790,000 towards the cost of the Government offices now being erected at Westminster. The construction of the buildings has already been sanctioned by the Legislature, and the intention is to raise the money as the work proceeds. The building at Westminster will be bounded on its four sides by Charles-street, Parliament-street, Great George-street, and St. James's Park, the frontage in Great George-street being 700ft. and that in Whitehall about 320ft. Practically its dimensions will be identical with those of the block in which the Foreign Office, Colonial Office, India Office, Home Office, and Local Government Board are located. Accommodation will be provided at the new site for the Local Government Board, the Board of Trade, the Board of Agriculture, Board of Education, and some other departments. The Bill includes £800,000 for land in Great George-street, including that upon which the Institution of Civil Engineers stands. Another item is one of £10,000 for the purchase of No. 5, Old Palace-yard, the residence of Mr. Labouchere.

THE last day of the Royal Academy for the current year attracted the usual crowd of holiday-seekers on Monday. Sales for the season have been well up to the average of recent years, a large number of the smaller canvases having found a market at easy prices. A fair proportion of the larger and more costly pictures have been sold, the list being headed by Mr. C. Napier Hemy's yachting study entitled "Youth," which has fetched the sum of £1,260. Sir E. A. Waterhouse's landscape, "Warkworth Castle, Northumberland," has been sold at £800; and Mr. John Charlton's battle picture of the "Charge at Rossbach" has brought £525. Sir E. J. Poynter's "Cave of the Storm Nymphs," and Mr. Joseph Farquharson's charming snow scene "The Shortening Winter's Day is Near a Close," have both been sold, but the price in each case has not transpired. Mr. Orchardson's study in portraiture, "Other Days," has been sold at £150, and the popular picture of Alain Chartier, the poet, receiving a kiss while asleep from Margaret of Scotland, in the presence of her attendants, has been disposed of at £600. The "Wonders of the Deep," by John R. Reid, has been sold at £84, and E. W. Waite has sold his "Autumn in her Weeds of Yellows" at £262 10s. and his "Now Autumn's Fire Burns Slowly Along the Woods" at the same price. Mr. W. Frank Calderon's "Lot 97, a Grey Mare," has brought the round sum of £500, and "Faith," by C. E. Perugini, £400. The two most popular canvases of the year have evidently been purchased by the Chantrey Bequest—viz., Mr. David Murray's "In the Country of Constable," which fetched £630, and "Autumn in the Mountains," by Mr. Adrian Stokes, for which the sum of £300 has been given.

THE Coal-smoke Abatement Society, which in 1901 organised a series of tests in order to ascertain which open grates were best adapted for the prevention of smoke, has received a report from the jury of experts nominated by the society, who have recently been conducting a further series of tests in connection with the Lighting and Heating Exhibition at the Crystal Palace early in the year. Of the grates entered for competition at that show, five were selected by the jurors as being in theory nearest the ideal, in order to undergo an exhaustive series of practical tests in a building specially placed at the disposal of the society by his Majesty's Office of Works. The result of the experts' investigations and experiments is that Messrs. Chavasse and Kerr, of Birmingham, have been awarded a certificate by the society for their grate, known as the "Tropicana," which came out first among those tested for heating purposes, diminution of smoke, and economy of fuel used. The object of the society in arranging these tests is to secure, if possible, the production of a grate which, in burning the ordinary household coal, will consume its own smoke.

THE report of the Select Committee on the Ventilation of the House of Commons was issued last Friday. The committee investigated the condition of the air in the chamber, and found it to be purer than was found in many similar buildings. The conclusion, however, was not confirmed by the subjective test of the members'

own feelings, who complained of lassitude and feelings of heaviness after a lengthy stay in the House. The committee, besides making certain recommendations on the present system of ventilation, recommend the appointment of a sanitary officer to superintend the ventilation of the House, the placing of the whole of the cleaning arrangements under one authority, and the more frequent removal, for cleaning purposes, of the open-work matting on the floor which covers the air entrance under the present system. The committee believe that particles of dirt and other impurities must be borne into the chamber by the air passing through this matting.

The Public Buildings Expenses Bill contains an item which illustrates the decline in the value of public securities. By the Public Buildings Expenses Act of 1898, £2,550,000 was appropriated for the construction of public buildings; but as the expenditure of the money must be spread over several years the bulk of it was invested in Consols. The Bill now before the House contains an item of £80,000 to make good the depreciation in the value of the money invested since the year 1898. The original estimate for the buildings sanctioned has also been exceeded by £500,000, and for this sum a vote is also taken.

The members of the Bridge House Estates Committee met last Friday at the Guildhall, under the presidency of Mr. Deputy Pryke, the chairman, to sign a report in favour of a scheme for rebuilding Southwark Bridge at a cost of nearly £350,000. It is proposed to lower the crown of the structure by 7ft., a work which will in no way impede the navigation on the river, while it will reduce to a very large extent the excessive gradient on the City side. It is owing to the steep gradient on the City side that Southwark Bridge has of late years been avoided by the drivers of heavy vehicles. A proposal from the County Council to run an electric tramway over the bridge into the City is also under the consideration of the Bridge House Estates Committee.

An amalgamation has been made between Messrs. Measures Brothers, Ltd., of 53a, Southwark-street, S.E., and H. and G. Measures, of Croydon. The purchase price agreed for the goodwill, plant, tools, and stock works out roughly at £43,000, of which £20,000 is to be paid in cash and the balance in ordinary shares. This includes plant and stock of Messrs. H. and G. Measures at Battersea, where there is a building site with a frontage to the river, which Messrs. Measures Brothers propose to lease for fourteen years with the option of purchase of the freehold during the first seven years. Messrs. Measures Brothers have secured the opposition business for about one-ninth of their total capitalisation; so that about 85 per cent. of the amount paid or to be paid to H. and G. Measures for the whole of their business is in available and tangible assets.

The effect of automobiles on roads is attracting considerable attention here, where there is an opinion gaining ground that the large pneumatic tires passing rapidly over the surface suck the binder from the interstices of the stone. The *Engineering Record* has been investigating this subject, and has failed so far to find among American road experts any confirmation of this foreign view. The only engineer who has noticed any effect which might be due to this cause is Mr. Louis L. Tribus, commissioner of public works of Richmond borough, New York, who writes: "While we have noticed some of the suction action mentioned, we have not as yet discovered that any serious damage has been done—that is, to be able to charge it particularly to the rubber tires of automobiles." Mr. Henry Manley, assistant engineer in the Boston Engineering Department, believes that "the rapid currents of air created by the broad wheels, independent of any suction, might produce the effect noted." Mr. Henry I. Budd, State commissioner of public roads of New Jersey, and Mr. Wm. Pierson Judson, deputy state engineer of New York, doubt if automobiles have any tendency to ravel macadam. Mr. G. A. Roullier, of Flushing, N.Y., believes that the tires of these vehicles may cause trouble when they become sufficiently numerous. "If, in certain sections, the extent of this suction becomes so great as to cause inconvenience," he writes, "the binding material might be mixed with a certain amount of limestone, so as to consolidate it as much as possible. At this writing I have in mind a piece of limestone road which is well travelled by automobiles, and I am aware that there is no raveling on that. It is perfectly

certain that no plain or ordinary binding material having no adhesive qualities of its own will resist the sucking action mentioned."

The site proposed to be acquired by the Garden City Pioneer Company, Limited, for their first enterprise is near Mitchin, on the Great Northern Railway. The estate, which is 4,000 acres in extent, can be reached from London in about an hour; it will furnish an abundant water supply, and it is for the most part 250ft. to 300ft. above the sea level. Upwards of £40,000 has already been promised towards the special fund of £50,000 which is being raised in order to enable negotiations to be completed, amongst the amounts subscribed being £20,000 by Mr. J. P. Thomasson (Bolton), £10,000 by Mr. George Cadbury and family; £2,000 each by Mr. Ralph Neville, K.C., and Mr. H. W. Lever; and £1,000 each by Mr. Aneurin Williams, Mr. H. D. Pearsall, and Dr. R. O. Moon.

The new *Times* building, in New York, offers some novel problems in construction. It is to be not only some twenty stories high above the street, but is to have three stories underground, the floor of the press-room being 55ft. below the curb. In addition to this, the city subway is to run through it, 22ft. below the curb; so that the press-room and composing-rooms will have a railroad above them. This feature is, however, regarded as advantageous, on account of the facilities which the subway will afford for distributing the various editions of the paper. Ventilation for the basement stories is to be secured by means of a shaft for supplying fresh air, while foul air is exhausted by a shaft, through the middle of which runs the main smoke-stack.

ARIOCH WENTWORTH, a retired marble manufacturer, a millionaire, and one of the largest estate owners in Boston, U.S.A., is dead at the age of ninety years. He began work in a granite yard, but left this to enter a soapstone factory, which he afterwards purchased. He afterwards took up the marble business, employing as many as 300 men upon all kinds of imported and domestic marbles. He was a great traveller, and had visited nearly every part of the globe. Arioch was one of the most venerable masons we remember hearing of. 'Tis said the reason no really old stonemasons are ever seen in London is that, when they reach their 40's, they become donkeys on Blackheath!

PETERBOROUGH, according to the *Birmingham Daily Post*, makes enough bricks in the course of a year to put a girdle four times round the earth. It is estimated that the busy brickmaking yards, which have grown up in great number round the ancient city in the last twenty years, turn out 800,000,000 bricks annually. As the length of a brick is about 8in., then, if Peterborough's annual output were laid out in a single line it would stretch over 100,000 miles. The brick industry has revolutionised the trade of Peterborough. Such is the wealth of clay and the profit to be drawn from it that one part of the brickmaking district has been fitly named "Klondyke." It lies in beds of enormous area and depth, and some of the experts say they could go on taking out the easily accessible clay for the next century without taking thought as to where the next supply of the material is to come from.

TRANSVERSE breaking-tests of plate glass furnished by several different makers were recently made at the Watertown Arsenal. From particulars given in the *Iron Age* we gather that the thickness of the glass varied from 1in. to 1in., and the span from 8in. to 24in. The modulus of rupture, which ranged from 2,000lb. to 8,000lb. per square inch, was generally greater with the lesser thicknesses. Of the various kinds of glass tested—rough, ribbed, polished, and wired—there was little difference in strength, except that the wired glass showed a little greater strength than the other kinds. The strength was also greater for the "sandwich rolled" than for the solid rolled wire glass. The strength of glass set in frames was practically double that of the specimens tested transversely.

There is a belief that the agitation for a new bridge over the Medway at Aylesford is beginning to have effect. A grant not exceeding £10,000 by the County Council would, it is held, meet all the necessities of the situation. The Rochester Bridge Wardens, it is believed, are prepared to contribute £25,000, and the Corporation of Maidstone, although the bridge will be entirely outside its jurisdiction, is relied on for £2,000 under a resolution passed some years ago. From other

sources contributions are expected which will, in the event of £10,000 being granted by the County Council, bring the total funds available up to at least £40,000, a sum sufficient, it is believed, to defray the entire cost of the new structure and of the necessary approaches. The plan which commends itself to the advocates of the new bridge is that of inviting competitive designs with a premium of, say, £100. This course, it is contended, would secure to the County Council, as the responsible authority, the best advice obtainable on bridge building, giving at the same time a sufficiently wide choice in the matter of architecture.

In the annual report of the water engineer to the city of Liverpool, Mr. Joseph Parry, there are several points of general interest. The total supply for 1902 was 17,572 million gallons—31·739 gallons per head of the population per day. This is distributed as follows: For domestic use and leakage on all pipes, 18·536; for trade purposes and meter, 7·822; for ships by meter, 0·578; for workhouses and industrial schools by meter, 0·672 per cent.; for extinguishing fires, ·020 (there was no serious fire during the year); for water for condensing at the pumping stations, 0·87; for miscellaneous purposes by assessment, 1·825; for public purposes, sewers, &c., 1·827; salt-water supplied for trade and public purposes, 0·372. Twenty per cent. of the visits of inspection resulted in the discovery of leakages, &c. The difference between the maximum and minimum week-day supply is only 9 per cent., but the Sunday demand is little more than half. A diagram showing hourly fluctuations indicates that the moment of maximum demand is between 10 a.m. and 11 a.m. in summer, but in winter this maximum is maintained almost throughout the day until 5 p.m. There is then a steady decrease until 2 a.m. or 3 a.m.

A NEEDLE-LIKE building has been planned by Mr. Arnold W. Brunner to occupy a 26ft. by 46ft. plot of land on New-street and Exchange-place, New York. It will be 18 stories high, and will be built for Mr. W. F. Havemeyer. After taking out the necessary space for elevator shafts, stairways, and corridors, each floor will have a rental space of 24ft. by 31ft. The structure is particularly interesting, because its erection will cut off the light of part of a large office building, which has already suffered from other neighbours in this way. The first of these lofty office structures were eagerly sought by people who desired to be isolated in airy, well-lighted rooms, but as their number has increased it has been found that, except on street frontages, an office on the fifteenth floor, say, may be no better than the accommodations afforded by the old buildings a few stories high.

Trade News.

WAGES MOVEMENTS.

SUNDERLAND.—There seems every probability of a lock-out occurring in connection with the operative joiners employed in the northern counties, this serious situation being, of course, largely attributable to the present Sunderland joiners' strike. The notices, which state that the lock-out will take effect on August 29 next, will be issued by Mr. W. H. Hope, of Sunderland, the secretary of the Northern Counties Federation of Building Trade Employers. If the dispute is not settled by a lock-out the Federation will then call upon the Yorkshire, Lancashire, and the Cheshire Federations, which combine to form the northern centre of the building trade employers, and with whose approval the present steps are being taken.

DESIGN AND SUPERVISION.

WHETHER the artist is always the most capable supervisor of his own design is a question of some interest. The modern professional architect, brought up and trained in an atmosphere of draughtsmanship and office routine, without the technical knowledge and experience of the craftsman, is certainly not the best supervisor of his own work. Even in the days of Vitruvius, who lays down the qualifications of the architect, it was considered that he was not the most skilful operator. The two functions are very different. A skilful planner may certainly not know the best mode of wall construction, or of laying foundations; and the artistic designer of an elevation may be quite ignorant of the best manner of giving effect to his design or details. The two things are quite separate, and will remain so, though there is no reason why the artist may not make himself a proficient supervisor of building operations as well. Certainly, if he wants to see his designs carried out in their integrity, in the true spirit in which they have been conceived, the best thing he can do is to make himself a master of the trades, and the way they should be carried out. And the earlier he makes himself a master of practical construction and technical methods of execution, the sooner will he be able to understand why certain designs and details he turns out of his office are misunderstood by the workman, or thought to be impracticable—why, in short, his detail drawings are sometimes altered, to their disadvantage in some respects, and why there is so much friction between himself and the contractor. And by making himself acquainted with the practical difficulties of execution, he will be perfecting his architectural training in the only real way. His practical training in the workshop and on the building in progress will react upon his design. He will begin to see things in a different light. For example, when he knows how to cut economically a block of stone for a cornice or a set of mullions, the detail of his cornice or the section of his mullions will be modified in a manner that will commend itself to the mason, if not to his own satisfaction. We can imagine the youthful and enthusiastic architectural designer sending in his first details, and the humility he must experience when the builder tells him they cannot be executed as shown. He may indeed feel indignant at any criticism on the part of the builder or workman, at the barefaced suggestion that his years of architectural study and sketching are to be thrown away simply because the mason or carpenter cannot understand the design, or has not science enough to grasp the solution. To him it resembles a druggist refusing to make up a doctor's prescription because he does not understand it. Probably the youthful architect would exclaim, "All things are possible if only competent craftsmen could be found." Such an idea, no doubt, has risen in the mind of many a young architect who has received his first "snubbing" at the hands of a workman by being told his drawing is not practicable. We do not deny that building contractors of a certain type are very obstinate in refusing to see any advantages in the architect's design; often ignorant of methods of doing work that they do not understand, or have not seen done before. There are occasions when the architect is right and the contractor wrong; when the

latter will not see things rightly because he has an interest in repudiating them, and is determined for the sake of a few pounds' saving to do the work his own way. Such men are, we hope, rare. Circumstances alter cases. When cost is not a consideration, the architect may be justified in disregarding economical methods of stone or timber cutting, in using solid masses; but the wiser policy is to endeavour to cut material to the best advantage, to use none wastefully. Experience in building operations will at least make it easier for the designer to co-operate with the craftsmen by making his detail drawings conform to methods of workmanship without exposing his design to the charge of being unworkable. The architect will have the satisfaction of being able to call to his aid methods of execution that will enhance the effect of the design. By knowing how certain things, like joinery, are executed, and the tools that are used, he can make them subserve his purpose. Ornamental effects may be obtained by the use of the tool to the surface of the wood in cutting simple devices, and in framing pieces together to produce a moulded effect. To take the construction, for example, of a wooden cornice over a shop made up of several pieces of wood. A joiner will have his own way of joining the pieces, of rebating and grooving and tonguing them together in the most economical manner. His method may not be the most satisfactory from the architect's point of view; but by knowing the method of cutting and jointing the latter may be able to construct a cornice that will give the effect of his design without cutting the mouldings out of the solid timber in a wasteful way. Small members may be moulded and grooved and tongued together and fixed on the brackets behind, which will give the desired effect with all the appearance of solidity obtainable in the solid. So in the detail of a skirting, very massive-looking and ornamental effects can be obtained by tonguing the separate moulded pieces together and fixing them on shaped backings without using any thick piece of wood or several mouldings cut out of the solid. Yet we have seen details drawn of a complicated set of mouldings without any reference to the methods of joining up the parts. We only instance these as examples of the value of understanding the trade methods as a means of producing the desired detail. Masons, carpenters, joiners, smiths, plumbers employ certain rules and methods of construction. If these are not understood or recognised in the architect's design, so much the worse for him, for the workman does not scruple to alter and misinterpret the intention where he finds it disobeys them. If workmanship is a true test of design, which it must be in architecture, the more skilled the architect is in the trades, the more likely he will be to express his ideas with truth and clearness. But this, we know, is a rather disputed question in the profession: while every architect acknowledges the importance of workmanship, there are many who consider it is distinct and subsidiary to design; that the architect should not be hampered or restricted by it. This opinion is strongly held by nearly all the members of the profession who belong to the older régime. They contend that the architect should be independent of the workman. In a particular sense, design is above craftsmanship. There are others of the more advanced school who believe that craftsmanship is the basis of design, that the architect must be a craftsman himself to enable him to embody honestly his intentions, and to this latter school many of our leading architects have attached themselves. The "handicraft movement" has considerably influenced the profession. We do not mean only in its opposition to machine labour, which it only does when machinery involves a loss of some artistic quality, but because of the deeper meaning

that handicraft is the only source of all good art in the past. The handicraftsman, to succeed, must be one who is able to determine every design by the gift of feeling, without which he can be no artist, as, for example, when and where machine labour may be used, and when not. And as design is largely a matter of feeling of artistic discrimination between right and wrong, it must be largely determined by the hand in co-operation with the eye or mind. It is in this sense—the gift of feeling, that design must to a very large extent be based on craftsmanship. The handicraftsman selects his own material, he considers what his work is to fulfil, and he shapes his material accordingly in the most convenient way, and this is the root idea of all true design. The extravagant phase of the French *L'Art Nouveau* style is the direct antithesis to this; it is really the result of making design independent of handicraft; it contradicts construction, makes everything subservient to a perverted perception, however bad and aimless; so that in these two modern movements we may very fairly judge the differences which divide the profession as to whether workmanship is the test of design or not. The test of the sensitive eye is absent in the New Art craze, which indulges in the most rococo and luxurious forms. The professional artist who looks with ill-concealed disdain at the workman's simple design is really in sympathy with the "New Art" which uses materials, not for their intrinsic value or beauty, but as fancy materials that can be made to imitate any other substance, and can be cut or tortured into shapes and purposes for which they are ill-adapted. Handicraft, on the contrary, follows the honest traditions of the best periods. One writer thus significantly puts the case. "In the old days the workman was his own designer. No one is prepared to assert that the Gothic carvers worked from other men's designs. But they did not have to work in different styles, which means that they applied themselves to their own, knew it, and could exhibit taste on it. Nowadays many workmen execute their own designs. But the times are evil; the workmen have to work in different styles, of which they know very little; facility and speed are everything, taste is nothing; the workmen's work is never really looked at—it is only part of the assertion of opulence, and is itself never cared about. With a revision to a simple style, one on which the workman can feel his way to individual expression, and in which he no longer repeats the formula of other times, he will be able to design simple patterns, and to make them evidence of intelligence and choice on his part." These observations apply not only to ornament, but to all architectural work. The designer commits himself to a style he does not know, because he has never been trained in it; but the old craftsman who was also his own designer, worked in one style—that in which he was brought up. Instead of designing in half a dozen or more diverse styles, he confined himself to the one which he had learned thoroughly, both on the building and in the workshops, and to which he could devote his whole time. The consequence was he could supervise his own design and make it appear just what he intended it should be—the only favourable condition on which design and workmanship can be united. As it is now, design is made a profession by itself; the architect learns to design in any style, it is a commercial transaction with him. But few men can learn to make careful drawings of work and master the handicrafts engaged in production at the same time. The design and work must go together—the artistic handicraft in short. Therefore we come to the only true conclusion, that the workmanship basis of design is the real one; the more the artist knows of the method of producing his work in certain materials the more

perfect he is. The sculptor and carver both execute their own design in the highest class of work; that artist is the most masterful and effective who can in the management and handling of the technical part of his art—the pigments, mixing, and manipulation—translate his ideas and impressions or passion on the canvas. The real artist has always been his own executant—the architect's work alone is divided. But it will be said the architect cannot execute his own designs in the same manner as other artists do. Under modern conditions it is impossible; the art of design has passed into the hands of a profession, the execution of construction into those of builders and contractors. The supervision of building is the one thing left to the profession to remind them of their original craft. It may be taken to be a remnant of the earlier practice, when the architect was the chief artificer and was master of the work. If the practice of supervising went, there would be nothing left to connect the architect's design with the real building. And yet there are some in the profession who would not trouble if this slight tie was also severed; they think that the superintendence of a building should be left to clerks of works who have been trained in the work. Practically this is the case already in the majority of large buildings, where the architect seldom puts in an appearance on the works unless it is convenient. The subject is one too large to discuss in one article. There are occasions when the complex nature of the building and its size renders the services of a resident superintendent indispensable; no architect engaged in professional work would have the time or opportunity of inspecting and examining everything in operation that was taking place. The practitioner likes to feel he is in touch with the building, and the process of superintendence enables him to be so. It enables him to have some control over work, to check irregularities or correct what is being done amiss, and to verify the work and details as the building proceeds. After actual execution of the work or the craftsmanship, superintendence occupies an important part, as it implies, of course, an acquaintance with the construction and methods of building, and its several trades. Hence it follows that the most competent superintendents of building operations are to be found amongst those who have a practical knowledge of the trades, and that clerks of works are generally recruited from men who have occupied the position of building foremen or master tradesmen. The architect has no such claim to practical knowledge of detail. He may, however, do much by assiduous attention, observation, and study to fulfil the duties of general supervisor of buildings over which he has control. Being the designer, he ought to be able to put his ideas in the material he employs, to master the best methods of carrying out his own details, though there are duties which might imply a considerable amount of personal observation and study of building operations far beyond the attainment of the average young architect, who has few opportunities of inspecting buildings during his three or four years' articleship, and his course of studies for the professional examinations. An ancient authority on architecture has said the architect should be more skilled as a judge than an operator. The observation leads us to a consideration of the question whether the judicial mind, one capable of weighing evidence or niceties of practice and of forming a comprehensive idea of the whole design, is not, after all, quite as well, if not better, qualified to supervise his own design than the craftsmen employed in the execution of the building. We do not deny our first enunciation that workmanship is the basis of design, but have to consider the modern practice of architecture as it obtains to-day—a number of separate trades employed by a

contractor who undertakes the work on commercial lines, and who has no personal interest in the design. Each workman may be the best judge of his own part of the work, but not that of his co-workers. The trades often overlap, or are in conflict with each other. A jury of workmen selected from the whole number may be competent to pronounce on the general excellence of the various trades as isolated features in the building, and yet be quite incompetent to give an opinion of the execution of the design. Here it is the competent architect's judgment is of value, not so much in assessing the merits and excellence of each trade as in determining the artistic merits of all trades as a whole. It is in this sense we think the supervision of the architect must be regarded. He is better able than the mechanical expert, generally untrained in the art of design, to judge of the effect of his work in relation to the whole building, to make allowances for conditions, to weigh the small *pros* and *cons.* of the technical observance of details to which many workmen attach too much importance, and to judge of the result and harmony of the work as an *ensemble*.

COTTAGE BUILDING.

ONE of the few classes of practice which often tax the architect is cottage building; and although there have been numerous letters, essays, and books published on the subject during the last quarter of a century, and it has claimed a large share of attention from social and sanitary reformers, the question of cottages for the labouring class is still a matter of controversy. The enormous increase of the population in our great towns and rural districts has led to the attention of all thinking men to the problem. Yearly a great number of the agricultural labouring class are drawn towards the large towns, where they seek work and recreation. The Garden City scheme has had many admirers, and the experiment has been tried with some success; but the requirements of the agricultural labourer and town workman are not to be met by the Garden Cities like Port Sunlight and Bourneville. They form a class of themselves. The agricultural labourer, it has been pointed out, has acquired his own habits of life; he does not study social problems with the same relish as his town brother; he is rather fonder of the village inn than of the club or mechanics' institute, and his home requirements and tastes are much more limited and more humble. The country cottage is a type of dwelling that cannot be compared with any we can show in the large town. The circumstances and conditions of each are different. In the country, of course, a good area of ground is required; there must be a garden—and what more reasonable or desirable? Another essential is that there should at least be a good-sized living-room, with a small scullery, bath, and sink attached. A common room, spacious enough for the family and a few visitors, is more necessary than two smaller rooms. It can be used as a parlour, a reading-room, or a washhouse. A few useful remarks on the subject were made the other day by Mr. Martin Shaw Briggs at the conference held at Bradford. As he said, much depends on the character of the landlord as to the character of the cottage. The Model By-laws have very seriously hindered the landlord in building cottages. These are points that have much to do with the kind and character of dwelling. The same writer said the "so-called cottages erected by artists and other Bohemians to recruit in the country at the week-end are of no use as types to follow," as they abound in "ingle nooks" and "dens," and other dainty little excrescences which the labourer does not require. Nor will the "flat" system of cottage-building help

the landed proprietor. As to materials and cost of building, the locality must in every case be considered. Where stone is plentiful, as in the North, Midlands, and Western districts of England, no material could be better, and good cottages, with parlour, living-room, and washhouse may cost anything between £250 to £350 in some parts where labour is moderate. Brick and concrete cottages can certainly be built cheaper in places where bricks and gravel are obtainable, and in blocks of three or more the price may be reduced. As an average estimate, 4½d. to 6d. per foot cube is reasonable in brick districts; for the latter sum per foot, brick and stone dressings, slate or tile roof, wood floors, and plastered walls may be obtained, the cottage comprising a parlour, a kitchen, small scullery, larder, and bedrooms, &c. Cottages of this general description have been erected in many parts of Hampshire and Sussex.

The requirements of plan vary with the condition and modes of life of the tenant. In the country, with a large plot of ground, a group of cottages will be often the best and most economical plan. There should, of course, be a front and back entrance. The size and number of the rooms will be determined by the requirements. In the smallest house there must be a common room or living-room, say 15ft. by 10ft. or 11ft., or about 150ft. square. It should be free from unnecessary breaks or furniture, yet arranged so that the fireplace should form a comfortable centre, cut off from direct draughts from door or window. Mr. Briggs mentions an elementary type of plan adopted by the Liverpool Corporation for their concrete flats. It has a living-room 15ft. by 10ft. 3in., with a large fireplace, the sink and copper occupy a small space of 4ft. by 3ft. 6in. at the back. The washhouse is also small. These flats cost only £100 each. A common washhouse is often essential, with bathrooms. The following are necessary on the ground floor: a living-room of the area mentioned, a ventilated food cupboard, such as may be seen in the Guinness Buildings in London, or washhouse or scullery with copper and sink, and perhaps a bathroom. Two types of plan are given in detail, which we may briefly describe. The front door opens into a lobby about 3ft. square, with stairs in front, about 2ft. 10in. wide, cut off from living-room; the latter is entered by a door on left of porch or lobby. It is about 160ft. square, with large fireplace in opposite wall, and cupboards in the recesses made by the jambs. An angle cupboard is suggested by the author of the paper. The window being in the entrance front, a good left-hand light is obtained for cooking. The height of rooms where oil is burnt may be lower than ordinarily, and 7ft. 3in. to 8ft. may be sufficient. The latter is the By-law regulation, but for country cottages the low rooms are more conducive to picturesque effect externally, as the eaves of roof can be kept low. The architect may indeed render these country cottages more pleasing if the old type of cottage is studied in the grouping and roofing. A small larder is obtained, and a store under the stairs with a door leading out of living-room. Behind is a small scullery, 10ft. by 6ft., with sink and bath, with door at the back protected by a small verandah which runs along the back front. Some ingenuity is necessary in planning a small scullery that will contain a 20-gallon copper, a sink, and a bath; though it has been done in several plans we have seen. It is certainly not necessary to trap a cottage sink if a discharge-pipe be provided over a three-gallon tipping basin above the ground or by other similar means. In another type of plan a parlour is placed in front of living-room, both being entered by the porch with a door between the two rooms. The parlour has an angle fireplace, the flue being taken into the stack of the living-room fireplace. A side window is shown for the latter. The

scullery, stores, and larder are arranged as in the first plan. We do not think a second sitting-room desirable in this form of cottage: it detracts from the size of the living-room. The front parlour, it is truly said, panders to a popular prejudice; it may be smaller than the living-room behind it. In Yorkshire Mr. Briggs says it is used as a Sunday afternoon sitting-room, and for the display of family photographs and ornaments; but the space it occupies is better used in making a larger living-room or kitchen—a more useful apartment for the agricultural labourer. The bedroom plans over show three rooms ingeniously arranged from a small stair landing, with three independent doors opening into them. The partitions are so formed as to give bed recesses in some cases in the smaller rooms; there is a linen closet from the front bedroom over lobby. The area of each bedroom ought to be about 80ft., each with small register stoves: the front one larger. We have thus described two types of cottages illustrated by Mr. Briggs. In both cases the coal-store and c.c. are detached, outside. We do not think they are the most perfect in plan for every situation. The lobby and straight staircase are rather cramped for a country cottage, and we think it is possible to devise a larger lobby entrance between every two cottages, the recesses internally being utilised for stores or larder, and the stairs made to ascend from the living-room at the inner side by a few return steps from the room. For single or double groups of cottages where there is ample space, corner porches or lobbies can be arranged within the boundary lines of main walls. The types of many of the old country roadside cottages with gabled projections other than rectangular in shape, afford considerable variety of elevation and roofing, and can be utilised by the architect. More comfort internally can be secured by a cottage with few well-devised breaks and recesses than in one of the box-like type, and many old cottages in Surrey, Sussex, and Devonshire furnish suggestions. The conditions of country life are not to be found in the town, so that the most perfect self-contained examples of model town labourer dwellings afford us very little to the purpose. One writer who has studied the question of cottage plans makes a few useful remarks. One of the paramount duties of the cottage-builder is to closely study the life and habits of the tenant; except we do, it is impossible to design a house to properly accommodate that life. The living-room, being the one most continuously used, must be liberally provided. The agricultural labourer lives largely out of doors; when he comes home for shelter and rest he naturally looks for one room—the living-room—it is the room where the wife prepares the meals, which is constantly in use, where the one fire can be lit for cooking and warmth, where the daily domestic work will be done, where the children will be gathered during the winter months. It should, therefore, be roomy and comfortable, having a cheerful aspect and outlook. There should be room in it to move about, to work, and to obtain rest. It should have a good cooking-stove, good cupboards, and dresser; the doors and stairs should be so placed as not to create draught or destroy the comfort. The doors ought to be not in a direct line with the fire, a plan that is best secured by having a recessed porch, so as to screen the fireplace, and provide seats near the window, which would thus be recessed. An inset porch answers the purpose best. The outer door should act as a screen to the fire, not, as is often the case, so placed as to create a direct draught across the window to the fire, and so spoil the most useful part of the room for sitting. The architect, in his planning of cottages, above all other kinds of dwelling, has to make the very best of his space, to consider the position

of the occupants at work or at rest, to allow space for the absolutely necessary fittings and furniture, and to endeavour to impart a sense of comfort in his living-room and bedrooms. The less the accommodation provided the more it is necessary to study these details of plan, so as to utilise to the utmost every square foot and inch of the space. To this end the design of all useful fittings and furniture should be considered in the plan. The positions of cupboards, seats, dressers, sinks, and stoves ought to be settled in the scheme quite as much as the position of doors and windows. As the landlord is the builder of country cottages, not the speculative builder or the company, the designer of these buildings has to approach the problem on a different level. The cottage has to be built for the poorest class, and every effort has to be made by the profession engaged on this class of work to avoid useless expense if they desire to keep the country cottage out of the hands of the speculative builder, or to encourage the country landlord to improve the accommodation and appearance of these humble structures. No doubt there is something to be said for Government undertaking the purchase of plots for this purpose; but the question need not be discussed here.

EXTENSION OF THE BRITISH MUSEUM.

A SCHEME for the extension of the British Museum has been for some years in contemplation, and is now about to be partially carried out by the designs of Mr. Henry Tanner, I.S.O., F.R.I.B.A., of H.M. Office of Works. A plan, we believe, was prepared by his predecessor, now Sir John Taylor, K.C.B., for certain additions to the edifice many years ago, but was never carried into execution. Sir Robert Smirke's columnar front in Bloomsbury was considered in its day one of the masterpieces of the Classic Revival. About a million sterling was, we believe, spent in its erection. The original architect had a good site to deal with, and was almost unfettered, yet perhaps few buildings were more criticised in its day. The original Montague House which it replaces was taken down piecemeal to make room for Smirke's design, the eastern side of which, that towards Montague-street, was first built in 1828, when the Royal library of George III. was deposited in it. The north, south, and western sides were afterwards erected as we now see them. The style, as most of our readers know, is Grecian Ionic, and few who look upon the huge façade towards Great Russell-street will hesitate to acknowledge that thousands of pounds were wasted on the erection of the colossal portico and the colonnaded wings. Fergusson, who was no admirer of Classic for new buildings, refers to the absurdity of placing forty-four useless columns 45ft. in height just round the front while the flanks are left bare. But the design of the present architect to H.M. Office of Works will be a commonsense addition of an important block facing Montague-place on the north side. The elevation, while it carries on the proportions of the façades, will be dignified for its purpose, and this scheme of external blocks round the north, east, and west sides of the present building will eventually afford ample space for the vast collections stored therein, besides rooms for students, &c. When the scheme is complete, the new blocks will, in fact, form the three sides of an external quadrangle, with space between the old and new buildings. The plan of the present museum is indeed a complete quadrangle, with its main entrance front towards Great Russell-street. The portico and colonnades will remain as they are. Describing the design, which, through the courtesy of Mr. Tanner, the architect, we have been able to see, we may say that the proposed extension will form a long range of galleries on the north side, towards Montague-place, about 380ft. in length between the corner blocks, which will unite it to the east and west blocks when complete. The block to be built comprises a central entrance portico of six detached columns, with flight of steps to the ground floor, a central hall with a long gallery 166ft. by 50ft. on each side. Above the ground floor there is a mezzanine, comprising rooms for assistants, studies, and offices, about 27ft. by 24ft. each. The east half of the floor is for the

prints and drawings department, and on the other half will be housed the Egyptian and Assyrian antiquities. A row of presses are also shown on the inner side. On the floor above are provided students' rooms and galleries. The top floor is lighted by skylights, without windows, and is included within the blank walling, cornice, and attic above the first-floor windows. The basement of the building comprises ample storage room, the side of the area being extended by means of glass roofs, between which and the main area are piers. There is a wide space also under the front, top-lighted. The sub-ground floor is devoted to receiving and packing-rooms, 55ft. by 40ft., in addition to storage area. Between the new and the old building, and connecting them on each floor, is a small block containing lavatories and waiting-room on the one side, and the stairs and conveniences on the other. These blocks are placed in the open area, between the two structures, and are isolated on both sides, affording good ventilation. The ground-floor story will have a height of 22ft., the mezzanine 14ft., and the upper story 20ft. We hope soon to illustrate the plans of the new block and the elevation towards Montague-place. The central hexastyle portico and the extreme projecting wings, when these are completed, will correspond in style with the remaining portions of the museum. The two tiers of windows are plainly treated, and will give ample light to the main ground story and one above. Portland stone and brickwork will be used in the construction—the former in the portico, columns, entablature, and window-dressings—and the estimated cost of the proposed extension is £200,000, of which £50,000 will be provided out of funds bequeathed to the trustees of the British Museum. The sketch plans have been on view in the tearoom of the House of Commons. When the scheme is fully carried out the museum will be considerably increased in area. The new façades will incase, as it were, the existing old galleries, and will be in accord with the architectural style of the building. As the great national storehouse of the antiquities of the Empire, in which are stored the finest remains of Greek and Roman art collected by the late Charles Townley, the famed Elgin marbles from the Parthenon, the pedimental sculptures, the Hellenic marbles, and the Egyptian and Assyrian sculptures, the British Museum will always possess intrinsic value to the connoisseur and architect for study. The new galleries will afford the student and collector better facilities for their research and labour than they have hitherto possessed, and we therefore look forward with satisfaction to the additions about to be made to render this treasure-house worthy of its reputation.

STANDARD SECTIONS FOR TRAMWAY RAILS.

WE have received a copy of the "Tramway Rail Specification" issued by the Engineering Standards Committee, a publication which will be welcomed by all engineers and promoters and authorities engaged in tramway construction. The Engineering Standards Committee, which is supported by several influential professional institutions, including the Institution of Civil Engineers, the Institution of Mechanical Engineers, Naval Architects, and of the Electrical Engineers, has accomplished a very useful work in publishing sections and specifications which will be of indispensable service to all engineers who are planning and specifying tramways. The clauses are numbered for specification purposes. The first clause provides that "the steel for the rails shall be of the best quality made by the acid Bessemer, basic Bessemer, or other approved process," and gives the chemical composition, in which the carbon is to be from 0.40 to 0.55 per cent., and the manganese from 0.70 to 1.0 per cent., &c. Referring to the sections, minute particulars are given. The sheets of full-size sections show every dimension and radius of the smallest curve, and range from "B.S." section 90lb. per yard to "B.S." section 116lb. per yard for use on curves. There are ten sections given and numbered. No. 1 section, 90lb. per yard, gives a rail 6½in. depth to lower bed-plate or flange, and 3½in. wide at the top, and 6½in. at the bottom flange, so that the depth and lower flange width are the same. Clauses are given for every section for straight or curved track only necessary to be filled up by the No. weight per lineal yard, and a table of general dimensions of "B.S." rails is appended. No. 3 section has a

height of 6½ in. and a width of flange of 7 in., and has a weight of 100 lb. per foot run; No. 4, 7 in. by 7 in., weighs 105 lb., No. 5, of the same dimensions, weighs 110 lb., and this height and width are the greatest. Rails are to be paid for according to the actual weights before drilling or punching, and such weight is to be ascertained during the rolling. Two sets of templates, internal and external, of each "E.S." section, are to be supplied by the manufacturers (if required) before the rails are manufactured. The length of rail for straight track is to be either 35 ft., 45 ft., or 60 ft., and clause 10 provides the maximum proportion of short lengths which shall be accepted. The normal length of rails for curved tracks is 35 ft., and 5 per cent. in number of rails are to be accepted in lengths of 30 ft., 2½ per cent. in lengths of 25 ft., and 2½ per cent. in lengths of 20 ft.

Referring to the tests, it is provided in clause 17 that out of each 80 rails one may be selected by the inspector as a sample, and a 5 ft. length cut therefrom which shall be supported on solid iron bearings 3 ft. 6 in. apart in the clear. Such piece of rail is to receive a blow in the middle from a ball or tup weighing not less than 2,240 lb., the striking force of which shall have a radius not greater than 9 in.; the tup shall have a fall of 15 ft. for rails less than 100 lb. per yard, and of 18 ft. for rails of 100 lb. and over per yard. The ultimate tensile stress required (clause 18), is not to be less than 40 tons per square inch, with an elongation of not less than 12 per cent. on a length of 2 in. The bending test is equally severe: the rail shall be bent sideways by pressure to a curve of 30 ft. radius without showing signs of cracking. If not satisfactory, these tests are to be repeated; in the case of tensile stress a second rail is to be tried, and if it fails the whole of the rails may be rejected. Clauses 22, 23, &c., specify the holes to be made for fish-bolts and joint-plates and their diameters and position. All rails accepted are to be stamped in the presence of the inspector. The fish-plates are also shown on each of the illustrated sections. For the inner fish-plate of the lighter sections of rail, they are to be 2 ft. long and 22½ lb. weight, and for the outer fish-plate the same length, 27½ lb.; for rails 105 lb. weight the inner fish-plates are to weigh 26 lb., and the outer 30½ lb. We may state, for the information of the reader, that copies of the specification and sections may be obtained on application to the Secretary of the Committee, Mr. Leslie S. Robertson, M.Inst.C.E., 28, Victoria-street, Westminster, or from the publishers, William Clowes and Sons, Ltd., 23, Cockspur-street, Charing Cross. Separate copies of each standard tramway rail section can be obtained, price 1s. 1d. post free, also sets of templates. We must assume that the sections given are those which scientific knowledge and experience have dictated. The groove for the wheel measures in all the lighter sections, ¾ in. by 1½ in., though bevelled to a narrower width at bottom of groove with rounded corners; the flat bearing portion of upper flange varies in the lighter sections: it measures 1½ in. from groove to outside of flange, in the heavier sections 2 in. and 2½ in. The upper bearing flange has a bevel or slope of 1 in. 21 to the inside of track, and a thickness of 1½ in. to 1¾ in. The tendency is to increase the depth of groove, and to make the "lip" of rail extend, especially in curves. There is ample play given to the tire of wheels, and the curves are such as to minimise the friction on surfaces as much as possible.

"BUILDING NEWS" DESIGNING CLUB.

A BAND STAND AND TEA PAVILION.

AMONGST the multifarious undertakings imposed upon the county councils and district councils by the Legislature and needs of the times, few duties are more obvious and necessary than the work of securing open spaces and recreation grounds in populous places. Parks and public gardens necessitate band-stands and refreshment pavilions. These generally are designed by surveyors and their draughtsmen, who obviously, judging by results, are quite incapable of producing suitable plans for such buildings, and manufacturers of cast-iron goods are contracted with to design and supply kiosks and such-like erections, but it is only too seldom that vulgarity is avoided, and monstrosities result. The fact is, the authorities themselves, like the man in the street or the free and independent ratepayer, generally display the utmost indifference to art

influences, thinking, as a rule, that so much frilling of ornament, so-called, adds more or less, according to price, to the beauty of any building, and specially to park architecture. The more pretensions the more one is supposed to get for the money. Besides, garishness appeals to the vulgar, and popularity is accorded to a project so perpetuated. It can be only by hammering away in season and out of season that matters in this respect will be mended. The best way to insure such a much-to-be-desired result is by practical demonstration to show how such buildings ought to be designed. With this idea we set the subject for our Designing Club; but, we fear, with only qualified results. As a matter of fact it requires a considerable amount of skill and good taste to produce an artistically designed band-stand, which shall serve its purpose properly, and present an attractive appearance without being overdone. It is the easiest thing in the world to draw out a bald baldachin on square or circular posts—a sort of cow-shelter which, with a thatched roof, would do very well in a field or wilderness park. That only presents the elements of the problems. A refined taste, probably, would not depart far from the elementary idea; but clearly, to be a success, a band-stand should carry the conception to a more decided conclusion. Our readers must judge for themselves as to whether "All British," "Needle Points," and "Solo," the three designs which we have awarded places to in this order, merit approval or not. They are the best of all the designs submitted in this the final contest for the Club session, 1902-3. "All British" says his mission as an architect is "to deal rather with larger issues of building, leaving the craftsman to fill in the detail which he [the architect presumably] inspires as he moves among them." In the absence of a venacular art it is hardly clear what the result of such a relegation of detail would amount to, and we doubt the redemption of labour to a higher plane while trade-unionism levels labour by destroying all chance of individuality by penalising it in every direction. Be that as it may, an architect can only rely on himself, and the more carefully he details his work the better the result will be. The pretty fancy of the tubular bells electrically operated to justify the sort of ventilating turret which "All British" calls his "little belfry," rather reduces his design to toy-like proportion with its dodecagon plan and flying buttresses. The shutters would be rather bothersome to shift. The tea pavilion is better than any of the others; but we do not understand what the scale-like flounce to the verandah openings at the ends is intended to represent, and it is not clear as to how "Rhoda's Pagoda" flag would be hoisted through the ventilator box.

"Needle Points" brings matters more nearly to the ordinarily possible, and on the whole he assimilates the likely with an amount of refinement which must be recognised, though we are aware that his proposal suggests too much the cabinet-maker with the puny spandrel panels and commonplace trusses on which the semicircular wood archings rest. This shape is a brick or stone form, and is not adapted to wood, particularly out of doors, for it is bound to crack and weather badly where it is cut out of the cross grain. The roller shutters look ugly when down, but they are more handy than shifting leaves hooked in on pins as in the first design. The tea-room plan is good, but we do not like its exterior. It is wanting in simplicity.

"Solo," the third man, does not improve his bandstand by the sight of his detail. The Ionic half-columns are much too tall in proportion for such mutilation, and their volutes are badly drawn. The inner ones would be soon knocked off by the shutters running up and down. The roof is not happy. In perspective it would look like a flat, with a spire rising in the centre to carry the vane. The pavilion is better with the corner set bays; but all four should have been thrown into the room, and the kitchen would have been better located as a wing to the rear, something like the one "Needle Points" has drawn.

"Lot" would have stood higher if he had not made the initial mistake of dropping his revolving shutters from the eaves of his bandstand, so that, being without guides to run in, they would hang into space beyond the lines of the angle-posts, and thus have a space between. He draws all upon one side of his sheet of paper, crowding the parts together, and doing his plan to half-scale, leaving any amount of paper vacant. "Lot" should stand better another time. "Brassey" gives a

circular bandstand, and puts sinking sashes to drop into pockets which are segmental on plan, and so are calculated to give trouble by hanging up awkwardly. His design is quiet and commonplace, but his pavilion, with half-round bays, would be pretty. "Pan" cuts the angles off a square plan for the bandstand, and fills the eaves in with lead quarry glazing in "cathedral" glass, possibly with bull's-eyes. The ceiling is flat, and shutters revolve from behind a cove. "Icicle" disappoints us again. He mixes up all kinds of detail so, and lets go good proportion entirely. We really cannot spare the time to pull his detail to pieces; but he is good man enough to realise that carved work and copper repousse ill-accord with strutted circular-cut timber projections mortised into sole-pieces. Shaped flat balusters of varied shape quarrel with the moulded cappings to the posts. The roofing of the tea-room is too clever by half, and inside the room is crowded. "James" sends an ugly fronted pavilion with recessed segmental seats. The detail is better than the small scale for the band stand would suggest, as his columns are not shaped really like tapering sausages, as if entasis was got by a mere swelling in the middle of a length. "The Kid" is no doubt a clever one with a fancy for Arts and Crafts vagaries full of odd fancies. The four little courting alcove rooms called ingles would never do for a public refreshment pavilion in a park, though the idea is suggestive. Upstairs there is a balcony which is omitted in the side elevation. Why the lamp should be placed in the centre of the outlook, to knock the spectator in the eye is not obvious, with its spiky Japanese freedom, done in copper, and Noah's ark trees to match. "Bon Bon" sends a sort of bandbox design, with a pepper-caster roof. He shows ingenuity, however, and is painstaking, but misdirects his energies into circular forms till we get a circular kitchen half open to the room, the completed figure being made up with counters. The centre of the tea-room is devoted to a dog-legged stair leading to two cramped balcony bays above, which would only lead to a difficulty in police supervision among the visitors who of necessity are very mixed in public parks. "Peg," if more ordinary, avoids such difficulties, and at least his designs are practical and roomy. His bandstand is better than the pavilion. "Calabar" prints his name so that it can hardly be read. His designs are involved, and want simple notions. "Ogee" is a most careful worker, drawing with a fine line and showing on all his scantlings. We wish we could place him higher.

The following were the conditions for the competition issued to the members of our club:—"A teak-constructed Bandstand, for erection by a county council in a public recreation ground, and a detached Refreshment Pavilion in half-timber. The former to be 25 ft. diameter, and open at the sides, with shutters to moderate the draught and exclude the weather. The roof to be covered with oak shingles. The floor to be 2 ft. above the ground level. A detail of one bay to ¾ in. scale to be provided, with sections of parts shown. The structure can assume any suitable form, but simplicity is desired, and the detail must be adapted to an exposed situation. The Refreshment Pavilion is to be 30 ft. long by 18 ft. wide, and to have a small kitchen included in these dimensions at one end for making tea, &c. A counter is essential, and a feature may be made of projecting bays for table alcove recesses out of the room. The eaves to be 10 ft. above the floor, which is 1 ft. above the ground level. No exception would be taken to a verandah. Roof to be red-tiled and have good eaves, but no ornamental cresting. No sanitary provisions are needed, as a convenience exists in the vicinity of the proposed pavilion. The cost of both buildings will have to be submitted to the Local Government Board. Scale, 8 ft. to the inch, and sufficient drawings to illustrate the scheme, but no perspective sketches. The plans, if space is limited, may be drawn to a less scale."

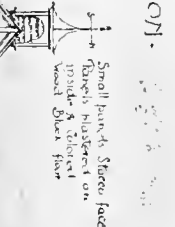

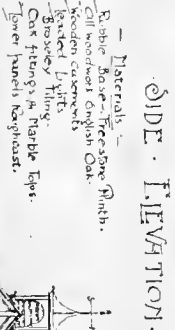

The new session of the BUILDING NEWS Designing Club will commence in October, when the award of the prizes for the past session will be announced.

A scheme of sewerage and sewage disposal is about to be carried out by the Guildford Town Council, for which a loan of £1,475 has been sanctioned by the Local Government Board.

The Castle Museum Committee of Nottingham Corporation, at the next meeting of the Corporation, will ask for a loan of £10,000 for restoration and other works at Nottingham Castle.

RULES AND REGULATIONS FOR ADMISSION TO THE SCHOOLS OF THE ROYAL ACADEMY.

1. **A**DMISSION to the schools can, subject to passing the required examination, be obtained at any age. But no student is eligible to compete for any scholarship, prize, or medal who is more than twenty-eight years of age on the date fixed for the delivery of the competition works, or of the works for the admission of probationers (see Rule 3).

2. All instructions in the Academy is gratuitous: but the student must provide his own materials, with the exception of clay for modelling, which will be provided and maintained by the Academy, and is not to be removed.

3. Applicants for admission must obtain from the Registrar, through the written request of any member of the Academy, or other artist or person of known respectability, a printed form, to be filled up and delivered at the Royal Academy, together with a certificate of birth and the works required as specimens of ability, on or before January 1 or July 1. Architects must also send a certificate from an architect member of the Royal Academy, of the Royal Institute of British Architects, or any other public Institution for teaching art and science, certifying that the applicant has followed up the study of architecture and architectural drawing, and has acquired a fair degree of proficiency in the same. The age and sex of the applicants must in all cases be stated on the face of the works submitted, and also the place where they have studied.

4. The works required are:—

Painters: (1) A finished drawing in chalk, not less than 2ft. high, of an undraped antique statue; (2) a drawing of a figure from the life; (3) a painting of a head, life size, from the life; (4) a design for a composition. The size of each work to be 30in. by 22in. and unmounted.

Sculptors: (1) A model, in the round, about 2ft. high, of an undraped antique statue; (2) a model, in the round, of a figure from the life; (3) a drawing of a figure from the life; (4) a model of a composition. The size of the drawing to be 30in. by 22in. and unmounted.

Architects: (1) An elevation and plan of a building, or some part of a building, to be done from the candidates' own notes and measurements, which shall be submitted with the drawing; the notes and measurements to be taken from the building itself; (2) geometric elevations of the Doric, Ionic, and Corinthian orders, with their entablatures complete, to $\frac{1}{2}$ in. scale, the columns to be 2ft. high; (3) an original perspective sketch in pencil of an existing building, or part of a building, on a quarter-sheet of imperial paper; (4) a drawing of a piece of architectural ornament from a cast, shaded in pencil or chalk, or tinted, and of the size of the original. All the drawings required must be on paper and unmounted; or there may be submitted instead of works (3) and (4) a portfolio of not less than six original sketches of architecture, of which one shall be an original design, and at least two others shaded studies of architectural sculptured ornament.

5. The above required specimens of the applicants' ability will be submitted, within two weeks of the date of their being sent in, to the Council, who will admit as probationers those whom they consider qualified to try for admission as students.

6. Notice of their admission as probationers will be sent to the successful applicants, and they will be summoned to attend on a fixed day at the Academy, and there execute the following works:—

Painters: (1) A painting of a head, life-size, from the life, to be done in six days of $3\frac{1}{2}$ hours each day, 9.30 a.m. to 1 p.m.; (2) a drawing not less than 2ft. high of a figure from the life, to be done in six evenings of two hours each evening, 6 p.m. to 8 p.m.; (3) a sketch of a design of a given size in black and white, from a subject to be set by the Keeper, to be done in one day, 9.30 a.m. to 4 p.m.

Sculptors: (1) A model in the round 2ft. high of a figure from the life, to be done in eleven days of $3\frac{1}{2}$ hours each day, 9.30 a.m. to 1 p.m.; (2) a drawing of a figure from the life, not less than 2ft. high, to be done in six evenings of two hours each evening, 6 p.m. to 8 p.m.; (3) a model of a design in clay or wax, from a subject to be set by the Keeper, to be done in one day, 9.30 a.m. to 4 p.m.

Architects: (1) A drawing from memory of one

of the Orders, to $\frac{1}{2}$ in. scale, the Order and height of the Order to be fixed by the council, and no book or other aid allowed, to be done in one evening of two hours, 6 p.m. to 8 p.m.; (2) a drawing from a cast, the size of the original, to be done in three evenings of two hours each, 6 p.m. to 8 p.m.; (3) an elevation and plan of a building, or of some part of a building, or of one of the larger architectural works in any museum, to be done in two evenings of two hours each, 6 p.m. to 8 p.m., from the probationer's own notes and measurements, taken from the building itself, the notes and measurements to be submitted to the Council; (4) an architectural design, to be a subject chosen by the visitor for the time being, to be done in six evenings of two hours each, 6 p.m. to 8 p.m.; the drawings to be carried far enough to explain the design, but not necessarily to be finished, it being understood that the merit of the conception will chiefly be considered; a rough sketch to be done on the first evening which must be generally adhered to in working out the design.

7. In addition to submitting the above works to the Council, painters and sculptors will have to pass an examination in anatomy and perspective, and architects an examination in perspective and the history of architecture. The examiners will be appointed by the Council.

8. Those probationers who are successful will be admitted students of the Royal Academy for a first term of three years.

9. Two scholarships, each of the value of £40 a year, and tenable for one year, called respectively the "Landseer Scholarship" in painting and in sculpture, will be given, subject to the limitation as to age (see Rule 1), to the students in painting and sculpture respectively who shall pass the best examination for admission to the first term of studentship.

10. At the end of the three years, subject to the fulfilment of certain conditions and the passing an examination, students will be admitted for a further period of two years. The full period of studentship is limited to five years, and cannot be extended or renewed.

11. All the drawings and models submitted by applicants for admission as probationers must be removed by them personally, or through an agent, within one month from the date of sending in. Any works not removed at the end of the month will be destroyed. The Academy cannot undertake to pack and forward any works.

12. Applicants who have been unsuccessful in their first endeavours to gain admission as probationers can renew their application at any subsequent period, by again going through the prescribed forms (see Rules 3 and 4); but the works submitted must not be the same as those sent in on any previous occasion.

N.B.—These rules and regulations will come into force at the examination for admission in January, 1904.

By order of Council,
August, 1903. FRED A. EATON, Sec.

MANCHESTER SCHOOL OF ARCHITECTURE.

THE Manchester School of Architecture has been established pursuant to arrangements made between the Owens College, the Manchester Municipal School of Technology, the Municipal School of Art, and the Manchester Society of Architects. On the advisory committee of a dozen members are Mr. J. W. Beaumont, F.R.I.B.A., Mr. Paul Ogden, F.R.I.B.A., the Principal of the Municipal School of Technology, and the Principal of the Owens College. Professor S. H. Capper, M.A., A.R.I.B.A., at present Professor of Architecture at McGill University, Montreal, has been appointed as director of the school. The following courses have been arranged, subject to such modifications as may be found requisite on Professor Capper's arrival in Manchester in September, viz.:—(1) History of Architecture: A general survey of architectural history from Ancient Egypt to modern times, with special reference to the evolution of styles and to constructional forms and methods. The course includes: Ancient Egypt and Assyria; Greece; Rome; Byzantine and Early Christian Architecture; Romanesque; Monastic; Gothic; Renaissance. (2) Elements of Architecture. The Classical orders, Greek and Roman, their mouldings and details; arcading, Classical and Gothic. Gothic mouldings and

details; their construction and design; elements of architectural effect; composition and style. (3) Architectural Drawing and Design: Studies of the orders; rendering with pen and brush; elementary design. (4) Freehand Drawing and Modelling. Mr. Glazier, A.R.I.B.A., Mr. Corbett, A.R.I.B.A., and other members of the staff of the School of Technology and of the Municipal School of Art will take part in the instruction given in those departments respectively. The above courses are intended:—(1) For students who intend to take the degree of the Victoria University in the Honours School of Architecture. (2) For students who desire to take a full course in architecture without proceeding to the degree. (3) For students who desire to attend any of the special lecture courses of Professor Capper. (4) For students who desire to attend special courses at the School of Technology or School of Art, including certain of the courses in the School of Architecture. An announcement will be made after Professor Capper's arrival in Manchester as to courses for a second and third year. A further announcement will also be made with regard to the classes on Building Materials and Construction, Descriptive Engineering and Sanitary Engineering. A course of four popular introductory lectures will be given by Professor Capper in the Whitworth Hall, in October and November, at 8 p.m. Subject, "History in Architecture: the Medieval Abbey and Monastic Orders and the Medieval Cathedral." Admission to these lectures will be free.

THE LARGEST STEEL BEAM IN THE WORLD.

THE largest steel beam in the world has recently been placed in the framework of the New Amsterdam Theatre on Forty-second-street near Seventh-avenue. It is 85ft. long, 12ft. wide, and weighs 42 tons. This beam was placed in position high in the air, supported only by a light and frail-looking trestle of structural steel. Of course, the steel supports of a great building that is two complete theatres in one are anything but frail; but the big beam which, standing on edge, was twice the height of a tall man, seemed perilously insecure until the network of supporting beams grew around it.

The giant piece of steel serves a unique and important purpose. From it the large gallery of the lower theatre is to be suspended, so that there will be no pillars to obstruct the view of those either in the balcony or the gallery. In addition the beam supports the floor of the upper theatre, so that it is really the mammoth key of the intricate structure. It was made in Trenton, N.J., and was shipped in sections to New York. The work of assembling these massive sections in place on the trestle and uniting them with white-hot rivets constituted an engineering feat of considerable enterprise.

Theatres have been built of structural steel before, but the New Amsterdam is claimed to be a distinct advance. A unique feature is the double stage in the main or lower theatre. It is to be so built that it can easily be lowered, divided into two and slid aside while another stage, already "set" for the next act, is brought up from a still lower level to take its place. In this way it will be possible to make the most elaborate changes of scenery required in modern productions in two or three minutes.

A further step in the new attack on Lord Penrhyn's monopoly of slate quarrying in Bethesda was taken on Monday. The Pantdreiniog Quarry, which is one of a number to be acquired by the new Co-operative Slate Quarrying Company, and which contains a vein of slate similar to that which has made the Penrhyn quarries famous, was double-staffed and worked by two gangs, one commencing work at four o'clock in the morning and continuing till noon, the other from twelve till nine.

The Governors of the Lincoln Grammar-school have selected Mr. Leonard Stokes, of London, as the architect of the proposed new school to be erected on the Wragby-road site.

The village of High Garrett, near Braintree, was brought under the hammer last week, in 20 lots, which, with the exception of three or four, made good prices. Amongst the unsold lots were the village schools, for which there was no bid, and a public-house, which was withdrawn at £1,800. The property sold realised just under £10,000. The village was formerly owned by the late founder of the great silk crape industry which has its works in neighbouring parishes.

OBITUARY.

MR. THOMAS POTTER, architect, of Sevenoaks, died on Thursday night in last week at his residence, Clarendon, Granville-road. The deceased, who was 58 years of age, was a native of Maidstone and served a term in the office of Mr. J. S. Anson, of Week-street, in that town. Removing to Sevenoaks many years ago, he started business as an architect and surveyor, and in the course of time built up a large practice. He soon began to manifest an interest in local affairs, and for many years he served the town on the old local board, and its successor the urban district council. He was appointed Conservative agent for the district, and in that capacity suggested, and afterwards carried out, the scheme of providing a club and a public hall. He was also architect for the Dunton Green Church, for the new St. John's National Schools, and for a large number of the most prominent private residences erected in the district during the last 20 years. Some two years since it was found that he was suffering from an internal growth, and the case from the first was a hopeless one. Until recently he has kept to his business, being wheeled about in an invalid chair, but about a week ago the disease assumed a most serious form, and from that time he lay in a state of coma until his death.

THE death is announced of Mr. ANDREW CALDERWOOD, J.P., builder, Ellis-street, Kilmarnock, at the age of 55 years. Besides carrying on an extensive business, Mr. Calderwood took a prominent part in public affairs. He represented the fifth ward in the town council from 1876 to 1887 and from 1891 to 1897, and was a magistrate from 1881 to 1884. He was also for several terms a member of the School Board, and he was a representative to the Educational Trust, of which he was for some time chairman. He was a Justice of the Peace for Ayrshire. Among the more important buildings he erected in the town were the Burns' Monument in the Kay Park, the Opera House (now converted into a church), the Dick Institute, and the new academy. Deceased is survived by a widow and family.

WE regret to have to record the death of Mr. THOMAS HUXLEY, the well-known builder, of Malpas, which took place at his residence, after an illness extending over three months. The deceased gentleman was in his 83rd year, and up to a comparatively recent period had enjoyed the most perfect health throughout a life of activity and hard work. He began life with the proverbial half-crown, and by dint of unremitting attention had built up an extensive business as a builder and contractor.

CHIPS.

The corporation of Liverpool have agreed to build a new hospital for infectious diseases at Fazakerley at a limited cost of £121,457, in addition to £10,000 for the land and £5,000 for the furniture.

Property of the value of £10,852 17s. 8d. has been left by Mr. Henry Francis Storey, M.Inst.C.E., of 6, Albert-road, Clifton, formerly of the Indian Public Works Department, who died on June 18 last.

The memorial-stone of the new United Free Church at Low-water, Hamilton, was laid on Saturday by the Duke of Hamilton. The church is of simple Gothic design, and is estimated to cost £2,400.

Mr. Thomas Hughes, architect and builder, late of Hockley, near Birmingham, died on Sunday last at Stamford-road, Huddersworth, aged 62 years.

A Parliamentary paper just issued shows that the total amount of advances made to occupying tenants in Ireland (exclusive of tenants of glebe land) since the passing of the Irish Land Act of 1870 up to March 31 last was £23,034,538, of which £9,932,533 was advanced under Acts relating to land-purchase passed in the years 1885-83, and £12,133,635 under such Acts passed in 1891-96. The total amount of principal repaid in respect of such advances during the whole period was £2,160,059.

The choir of Bangor Cathedral, which has been completely renovated at the expense of Lord Enniskerry (estimated at £600), will be reopened on Sunday, September 3.

The names of Mr. G. H. Jones, building material merchant, of The Avenue, Broughton, and of Mr. Messrs Higson, decorator and plasterer, Pendleton, have been added to the commission of the peace for Cheshire. Both gentlemen are members of the town council.

The Ramsgate Royal Sailors' Rest and Bath will be completed about October next. The cost will be some £3,000.

Building Intelligence.

BRISTOL.—New baths in Maze-street, Barton Hill, Bristol, were opened on Monday. The exterior is plain, but the internal arrangements are very complete. The swimming-bath is 75ft. by 30ft. There are 36 slipper baths. The boiler-house is provided with tanks for the storage of about 9,000 gallons of water, and a separate cold water storage tank is also provided for Kane's Baths. The establishment laundry is well equipped, and comprises one of Bradford's patent "sugar" washing machines, equal to washing, boiling, and rinsing 350 to 400 towels at one time. It has also boiling and rinsing tanks with hydro extractor, together with a suitable draw-out drying-closet and mangle. The engineering work, including that just mentioned, has been carried out by Messrs. Thomas Bradford and Co., of London, Manchester, and Liverpool. The building is lighted throughout by electricity, all the wiring and lights being in watertight tubes and fittings. The general contractor is Mr. A. J. Beaven, of Dean-lane, Bristol. The sketch plans for the establishment were designed by the city engineer, and approved by the Local Government Board, who sanctioned a loan for the land, buildings, and machinery. The working drawings, specifications, and superintendence of the erection of the buildings and engineering contract have been undertaken by Mr. W. S. Skinner, architect, of Edinburgh Chambers, Baldwin-street. The amount of contract for the building work is £13,680, and for engineering close on £3,000. Mr. James Hurn acted as clerk of the works. The building is equipped with fire hydrants and fire extinguishing apparatus.

IPSWICH.—The board of guardians have under consideration a report by the workhouse committee recommending the adoption of plans for additions to the new workhouse in St. John's, prepared by Mr. Frank Brown, of Ipswich. They include the enlargement of the laundry, the provision of additions to the receiving and tramps' wards, and the conversion of the former proposed bakery into officers' mess-room, with a clothes-store over it. Besides these, plans have been prepared by Mr. Brown for the addition of a pavilion on the women's side, extending from about 7ft. from the married couples' quarters to the shelter in the children's yard. This would provide dayroom accommodation for an additional 60, and dormitory accommodation for an additional 50. This wing would be used for old women's quarters, and would be connected by a corridor with the present women's pavilion. The addition of a pavilion on the men's side, connected with the present men's pavilion by a corridor, capable of accommodating the 20 men who have slept in a room originally intended for a bakery, and 68 more in the dormitories, and 93 more in the day-room. The estimated cost is over £10,000. In addition to these proposals, Mr. Hamlet Roberts, corporation waterworks engineer, has prepared a scheme for constructing an underground tank to hold 60,000 gallons of water for the better protection and supply of the workhouse. The board decided to ask the corporation "to erect a water tower for the district of St. John's, in which the union workhouse, St. John's Home, lunatic asylum, and fever hospital are situated, thus doing away with the necessity imposed on these four establishments of severally incurring a separate outlay of ratepayers' money in making good this serious defect." The request was received by the town council at their meeting on Wednesday, and was referred to a committee to report upon.

LANGLEY MOOR, CO. DURHAM.—The new St. Patrick's (R.C.) mixed schools at Langley Moor have now been opened. They give accommodation for 337 children, and have been erected at a total cost of £1,691, being at the rate of £5 10s. per head. Mr. Jos. Robson, of Waterhouses, was the builder, and they have been erected from the designs, and under the superintendence, of Mr. H. T. Graddon, A.R.C.B.A., of Durham.

MANCHESTER.—An important improvement now in progress is the clearance of the great goods storage premises at the corner of Anburn-street and Piccadilly, in the occupation of the well-known carrying firm of Thompson, McKay, and Company. The new building, of which Messrs. Charles Heathcote and Sons, of Cross-street, Manchester, are the architects, promises to be a striking addition to the street architecture of the locality. It is to be of deep red brick and buff

terracotta. The site has an area of nearly 900 square yards, of which some 200 square yards cross the Rochdale Canal, which at this point passes beneath Piccadilly at the foot of the approach to London-road Station. The canal is spanned by two arches, and upon these rest the storage premises rising to a height of eight stories and seven windows long.

NORFOLK.—The new buildings at the Norfolk County Asylum will be opened on September 17 next, just 93½ years from the time that a number of county magistrates selected the plans of Mr. William Brown, architect and surveyor, of Ipswich, from among eighteen others, for the erection of a building for the reception "of the miserable subjects of this institution." Mr. Brown's plans were fully carried out by May, 1814, when the asylum was opened for the reception of forty male patients. A premium of 70 guineas was paid for Mr. Brown's plans; but the amount paid to the contractors for the building that was put up from them is not easily to be ascertained, nor can so much as the names of the builders be traced. Many additions have since been made. The enlargements and alterations now nearing completion have cost £70,000, and, except as regards a chapel, a recreation hall, and a laundry, the annexe is now a complete asylum in itself. The scheme which is just nearing completion adds another 150 beds to the accommodation. Mr. A. J. Woods, of London, is the architect; Messrs. King, of Vauxhall Bridge-road, are the builders.

SOUTHAMPTON.—The foundation-stone of the new Corn Market, Southampton, was laid on Thursday week. The building, which will be 52ft. long by 32ft. wide, is being erected by Mr. Wm. Ward, contractor, 113, Avenue-road, to the plans of Mr. Crowther, borough engineer. It will be a one-story building of red and white brick, with carved keystone, and with carvings of shepherd's crooks and sheaves of corn, the stonework being done by Messrs. Garrett and Haysom.

Engineering Notes.

CRYSTAL PALACE SCHOOL OF ENGINEERING.—Sir Fortescue Flannery, M.P., presided last Friday at the award of certificates to the successful students of this school on the close of the summer term. The meeting was held in the lecture theatre of the school at the Palace, and among those present were Mr. J. W. Wilson, principal; Mr. Maurice Wilson, vice-principal; Mr. Botham, assistant manager, Crystal Palace Company; Mr. J. Braston, and the three examiners, who were old students of the school. The vice-principal read the names of the students who had gained certificates, T. O. Pepper obtaining the highest number of marks, 262 out of a possible 272, for the first year's course in mechanical engineering. The following won first places:—Drawing office, A. R. Hodgson-Stevens; pattern shop, J. M. S. Culbertson; fitting shop, T. O. Pepper. Second year's course, civil engineering, first term, A. Maude; second term, E. Schneider; third term, D. R. Allen. Electrical Section: First term, lecture examination, C. T. Richardson and F. C. Wright bracketed; second term, lecture examination, A. H. Drummond; drawing and fitting, F. H. A. Thoday. A certificate of honour was granted to D. R. Allen for having obtained six certificates out of a possible nine, none lower than third in order of merit.

Messrs. Bruce Peebles and Co., Ltd., of Tay Work, Benington, have secured the contract for the construction of the new electric railway being promoted by the North Wales Power and Traction Co., Ltd. The scheme is for the harnessing of the immense watershed comprised in the lakes of Snowdon. The initial contract, amounting to £150,000, will supply approximately 10,000 H.P., and includes about thirteen miles of electric railway, constructed on the Ganz high-tension system. The line will pass through some of the finest scenery in North Wales.

Mr. G. J. Perram, secretary to the Public Works Department, Assam, has been appointed superintending engineer for irrigation, Hyderabad State, on Rs.1,200 per mensem.

The new parish church at Shettleston, Glasgow, was opened on Sunday for public worship. Built from plans prepared by Mr. William F. McGibbon, architect, Glasgow, the church is of the 13th century French Gothic style, and is seated for 1,050 persons. An organ has been provided.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the BUILDING NEWS, Clement's House, Clement's Inn Passage, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to THE STRAND NEWSPAPER COMPANY, LIMITED.

Telegraphic Address:—"Timeserver, London."
Telephone No. 1633 Holborn.

NOTICE.

Bound copies of Vol. LXXXIII. are now ready, and should be ordered early (price 12s. each, by post 12s. 10d.), as only a limited number are done up. A few bound volumes of Vols. XXXIX., XLII., XLVI., XLIX., LI., LXXI., LXXIV., LXV., LXVI., LXVII., LXVIII., LXIX., LXXI., LXXII., LXXIII., LXXIV., LXXV., LXXVI., LXXVII., LXXIX., LXXX., LXXXI., and LXXXII. may still be obtained at the same price; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

Handsome Cloth Cases for Binding the BUILDING NEWS, price 2s., post free 2s. 4d., can be obtained from any Newsagent, or from the Publisher, Clement's House, Clement's Inn Passage, Strand, London, W.C.

TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 0d. (or 6dols. 30c. gold). To France or Belgium, £1 6s. 0d. (or 33fr. 30c.). To India, £1 6s. 0d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 0d.

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of eight words, the first line counting as two, the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Situations and Partnerships.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" and "Partnerships" is ONE SHILLING FOR TWENTY-FOUR WORDS, and Sixpence for every eight words after. All Situation Advertisements must be prepaid.

*. Replies to advertisements can be received at the office, Clement's House, Clement's Inn-passage, Strand, W.C., free of charge. If to be forwarded under cover to advertiser an extra charge of Sixpence is made. (See Notice at head of "Situations.")

Rates for Trade Advertisements on front page, and special and other positions, can be obtained on application to the Publisher.

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page Advertisements and alterations in serial advertisements must reach the office by Tuesday morning to secure insertion.

RECEIVED.—D. C. Q.—L. M. and Co.—E. J. D., Ltd.—R. H. and Son.—J. B.—R. R.—A. W.

R. B. WITTEN.—Certainly the Urban District Council can do so.

Correspondence.

AN APPEAL BY THE A.A.

To the Editor of the BUILDING NEWS.

SIR,—The Architectural Association has now acquired possession of the Royal Architectural Museum in Tufon-street, Westminster, and has obtained from the Ecclesiastical Commissioners a new lease for 999 years on most advantageous terms.

A contract with Messrs. Holloway Brothers for the necessary reconstruction to suit our requirements has been entered into, the amount of which is £8,440. This expenditure is a considerable one, but the committee has felt that it is bound to make adequate provision for future requirements. Donations and promises have been received amounting to about £1,500, leaving a balance of £5,000 still required to meet the building contract, furnishing, and equipment.

In view of the importance of the work of the

A.A. to the profession generally, I venture to appeal through your columns for further donations to assist us in meeting our liabilities. It is earnestly hoped that we may be able to enter our new premises free from debt.—I am, &c.,

HENRY T. HARE, President.

The Architectural Association, 56, Great Marlborough-street, London, W., August 10.

QUANTITY SURVEYORS' CHARGES.

SIR,—I notice on page 159 that you comment on the offer made by professional men to prepare bills of quantities for public bodies. This has arisen from these causes:—

1. Besides regular quantity surveyors who have been trained in surveyors' offices, or have been in architects' offices, where all branches are carried on, this branch of the profession, like the strictly architectural branch, is recruited from those who have not succeeded as builders, and these men are appointed by public bodies to undertake work at less than the ordinary charges.

2. Public bodies are most careful to insure in their contract that the workmen shall be paid the full rate of wages, no matter what his qualifications may be, but will cut the professional man down to the lowest penny. I have known a commission as low as 10s. per cent. paid by public bodies for quantities of intricate buildings. The quantity surveyors to the School Board for London cannot make anything out of alteration jobs, and not much out of new buildings.

3. All branches of the profession are so overcrowded that surveyors are anxious to get work, either by tendering low or by offering a good portion of their ordinary commission to the architect introducing the work, and, again, architects in the struggle for work are glad to receive part of the surveyor's commission, as they have in many cases to pay some kind of honorarium to the person introducing work to them.

I do not see that the Surveyors' Institution can do anything, and things are daily growing worse.—I am, &c.,

FAIR PAY.

DOL CATHEDRAL.

SIR,—The square compartments shown in Mr. Weatherley's sketch are plaster of Paris copies of the originals. These were smashed up about four years ago, when I saw them lying at the side of the road. Both sides of the porch possessed panelling, which is, I think, rather a rare feature, but it is now gone—more's the pity. The carving under the arch to the porch is also a plaster copy of the original.—I am, &c.,

ANDREW OLIVER.

5, Queen's-gardens, W.

Intercommunication.

QUESTIONS.

[11998].—Contractors' Claim.—A contract for work amounting to £500 is let and duly signed; the contractor commences work, and does £50 worth. Owing to dispute between proprietor and local authority, the work is finally stopped. What amount is the contractor entitled to claim?—HALIFAX.

[11997].—Wood-Block Floor Smelling.—A wood-block drawing-room floor, formed of oak and teak blocks alternately, emits a very strong odour when room has been shut up for a few hours, or floor been recently scrubbed—due, I take it, either to the oil in teak or galle acid in oak—perhaps both. Could any reader advise practical and effectual remedy?—CAN-CAN.

REPLIES.

[11998].—Payment of Architect.—"W. A." should not give up any of the papers until his charges are paid, especially as the client appears to be short of money.—H. L.

[11994].—Shifting River.—Dredge or form a culvert to some suitable point.—H. L.

[11995].—Tree and Foundations.—There would be no risk if the house foundations were of sufficient depth.—H. L.

At the last meeting of the London County Council a resolution was passed appointing Messrs. J. Rider Hunt and Co., Bridge House, 181, Queen Victoria-street, London, E.C., one of the quantity surveyors to both the architect's and engineer's departments, which has hitherto been held by separate firms of surveyors, and is consequently a unique position.

New cottage homes for the school children of the Medway Union have just been built in Maidstone-road, Chatham, and were opened on Friday. Mr. G. E. Bond, of Rochester, was the architect, and Alderman Skinner, of Chatham, the contractor. The cost has been £20,000.

PARLIAMENTARY NOTES.

THE ARCHITECT TO THE BOARD OF EDUCATION.—Mr. Lambert asked the Secretary to the Board of Education on Tuesday what length of time Mr. Robson had served as consulting architect to the Board of Education, whether he had received notice that his services would be terminated on September 30, was such notice due to his incompetence, if not, what was the reason for it, and whether, in view of appeals permitted by the Education Act to be made by the denominational managers to the Board of Education, he would take steps to secure that the highest expert assistance should continue to be at service of the Board? Sir W. Anson: Mr. Robson has been engaged for 18½ years as consulting architect to the Board of Education. His engagement will terminate on September 30. No question of the competency of Mr. Robson is involved. The Board of Education are making new arrangements to meet new conditions, and will, of course, take care that they are properly provided with expert assistance in the matters to which the question refers.

HOUSING OF THE WORKING CLASSES (No. 2) BILL.—This measure passed through committee of the House of Commons on Monday, clause 12 (advances for purchase of ownership of dwelling-house) and 13 (sale of lodging-house) being struck out. On the consideration of the Bill as amended, Mr. Long moved, on Tuesday, various drafting amendments which were agreed to. Sir W. Foster said this Bill went some way towards making it possible for local authorities in town districts to provide buildings for people who were driven to reside outside towns; but there were a large number of other subjects to be dealt with before they could consider that adequate and sufficient powers were given to the local authorities to deal with the serious conditions that existed in our large towns and rural districts. Sir A. Rolit, Mr. C. Hay (Shoreditch, Hoxton), and Mr. P. Thornton (Clapham) congratulated the Government on the advances made by the Bill. The Bill was read a third time.

WORKMEN'S COMPENSATION, AND THE 30FT. LIMIT OF HEIGHT IN BUILDINGS.—Sir C. Cayzer asked the President of the Board of Trade, on Tuesday, whether his attention had been directed to accidents to workmen in or near buildings less than 30ft. in height for which, under the Employers' Liability Act, they or their families were not entitled to compensation in case of injury or death, and to the fact that at Leeds lately a working painter fell 28ft. 6in., and was killed, and his family received no compensation because the building was not 30ft. high; and, if so, whether he could see his way to introduce legislation to amend the Act. The Home Secretary: I presume that the hon. member intends to refer to the Workmen's Compensation Act, 1897, as there is no 30ft. limit with reference to the provisions of the Employers' Liability Act. I am aware that under this limit, as fixed by the former Act in regard to accidents in the course of building operations, cases such as that mentioned in the question must occur, and it has been stated more than once by myself and my predecessors that this is a point which must receive attention in connection with the Amendment of the Act which this Government have under consideration.

CHIPS.

The quantity of timber exported from Norway in 1902 was 1,961,725 cubic metres. This compared with 1,805,224 cubic metres in 1901, and 2,002,243 cubic metres in 1900. In 1901 the value of Norwegian timber coming to this country was £1,187,200.

Messrs. Wm. Potts and Son, clock manufacturers, Leeds, have received instructions to make and fix a new four-dialled illuminated striking clock and bell, from Lord Grimthorpe's designs, at the Yorkshire Inebriates' Home, Cattel, near York, which is now in progress.

The exhibition of arts and crafts by members of the Northern Art Workers' Guild was opened on Saturday at the Municipal School of Technology, Manchester, and will remain open until August 29. Admission free from ten to nine daily.

At Thursday week's meeting of the Blaydon and Whickham Council these authorities affixed their seal to a contract with Messrs. D. Rowell and Co., of London, for the erection of a suspension bridge, to be placed over the Derwent at Swallow in place of the present Sands Bridge, at a cost of £160.

Mr. L. E. Ward, chairman of the Tottenham District Council, presided at the opening of Down Hills Park—26 acres of land in the centre of the district. One-third has been laid out as gardens and the remainder as a recreation ground, and it has been acquired at a cost of £31,150, of which the Middlesex County Council contributed £5,300. It adjoins the estate on which the London County Council intends to build dwellings for 40,000 persons. Before declaring the park open Mr. Ward laid the foundation-stone of a dust destructor, which will cost £27,000.

LEGAL INTELLIGENCE.

THE POPLAR DOCK ARBITRATION.—At the Sheriff's Court on Tuesday, before Mr. Under-Sheriff Burchell, the hearing was resumed of the claim by the London and India Dock Company against the North London Railway Company for £140,000. The claim is in respect of a small piece of land with a quay frontage to the Blackwall Basin, which has been taken under Parliamentary powers by the North London Railway Company for the purpose of widening their locks and entrance from the Blackwall Basin to the Poplar Dock, of which latter the railway company are the lessees of the claimants for a term of 999 years. The claim is in the major part for damage consequent upon the recent action of the railway company in their widening, rather than for the actual value of the land. Sir Ralph Littler, K.C., for the railway company asked that his clients might be supplied with plans showing the exact nature and area of the land which would have to be taken for building the new entrance to Blackwall Basin from the river which the claimants had stated would be necessary in consequence of the railway company's action. Sir Edward Clarke having agreed to this, evidence was called on the railway company's behalf, and the case was again adjourned till Wednesday, when after hearing the summing up by the Under-Sheriff, the jury found for the claimants for the sum of £5,575.

CHALK RIGHTS AND CEMENT MANUFACTURERS.—(House of Lords, before the Lord Chancellor, Lord Macnaghten, Lord Shand, Lord Robertson, and Lord Lindley.)—*Tolhurst v. Associated Portland Cement Manufacturers (1900) (Limited) and Others.*—These were consolidated appeals from orders of the Court of Appeal (the Master of the Rolls, the President of the Probate Division, and Lord Justice Cozens-Hardy), dated August 12, 1902, which reversed the decision of Mr. Justice Mathew in the Commercial Court, dated June 12, 1901. The arguments were heard on July 7 and 13 last, Mr. Pickford, K.C., and Mr. George Wallis appearing for the appellant; and Mr. Younger, K.C., Mr. Bremner, and Mr. A. G. Wright for the respondents. The question depended on the true meaning and effect of a certain contract dated January 5, 1898, and made between Alfred Tolhurst, of the one part, and the Imperial Portland Cement Co., Ltd. The facts are stated in Lord Macnaghten's judgment. The Lord Chancellor last Friday said he was inclined during the argument in favour of the appellant, but had with some hesitation come to agree with the judgments about to be delivered. Lord Macnaghten: The question, as it seems to me, depends simply and solely on the true meaning and effect of the contract of January 5, 1898, made between Alfred Tolhurst of the one part, and the Imperial Portland Cement Co., Ltd., of the other. Two alternative constructions have been proposed. One follows the letter of the instrument and adheres to it closely; the other favours a more liberal interpretation, supplying, it is said, nothing more than what is required in order to carry out the obvious intention of the parties. The question is, Which of these two constructions is to be adopted? When that matter is once determined there cannot, I think, be any further difficulty. There are contracts, of course, which are not to be performed vicariously, to use an expression of Lord Justice Knight Bruce. There may be an element of personal skill or an element of personal confidence to which, for the purposes of the contract, a stranger cannot make any pretensions. But no one, I suppose, would seriously argue that a contract for delivery of chalk from particular quarries for the use of particular cement works cannot be performed by any person for the time being possessed of the quarries, or that it can make the slightest difference to anybody who the proprietors of the cement works or the actual manufacturers may be, provided they are in a position to carry out the terms of the original contract. Tolhurst was the owner of property at Northfleet, in Kent, containing extensive and valuable chalk quarries. He sold a piece of his land there known as the Little Dockyard to the Imperial Co., and that company bought another piece of land from the British White Lead Co., who also derived title from Tolhurst. The main object for which the Imperial Co. was formed was to establish cement works at Northfleet, and carry on there the business of Portland cement manufacturers. It was, of course, important for Tolhurst to secure a regular market for his chalk, and it was equally important for the Imperial Co. to secure a regular supply of chalk for their works. The effect of the contract of January, 1898, may be stated shortly. Tolhurst made a tramway to the boundary of the land bought by the Imperial Co. from the White Lead Co., and the Imperial Co. was to make a tramway outturning Tolhurst's tramway to a convenient spot in its land in order to enable him to bring chalk to the company's works. On completion of this tramway the contract provides that "the said Alfred Tolhurst, for a term of 50 years, to be computed from the 25th day of December, 1897, or for such shorter period (not being less than 35 years) as he shall be possessed of chalk available and suitable for the

manufacture of Portland cement, and capable of being quarried and got in the usual manner above water level, supply to the company, and the company will take and buy of the said Alfred Tolhurst at least 750 tons per week, and so much more, if any, as the company shall require for the whole of their manufacture of Portland cement upon their said land." Tolhurst was to provide rolling stock and traction power, carry the chalk over the company's tramway, and deliver it alongside the company's stores, but he was not to be precluded from supplying other persons. Delivery orders were to be sent in before 4 o'clock for the next day. The price was to be 1s. 3d. per ton, to be paid in cash monthly. The average monthly payment for any year after 1898 was to be not less than £188. Then there was a clause providing for the case of strikes and unavoidable stoppages, and authorising the company at its own expense to procure chalk elsewhere in the event of Tolhurst being thereby prevented from supplying the quantity required. In 1900 the Imperial Co. sold its undertaking to the respondents, the Associated Co., and went into voluntary liquidation. Its affairs were fully wound up, and all its assets have been distributed. Tolhurst brought in no claim in the liquidation. He stood by while the Imperial Co. was in process of dissolution. Tolhurst's case now is that by parting with its undertaking and going into liquidation the Imperial Co. rescinded or put an end to the contract of January, 1898, and that he is not bound under or in accordance with that contract to furnish supplies of chalk to the associated company for the purposes of the works at Northfleet which formerly belonged to the Imperial Co., whether the Associated Co. requires delivery in its own name or in the name of the Imperial Co. Now, what is the meaning of the contract of January, 1898? I cannot think there is much difficulty about it. It is expressed to be made between Alfred Tolhurst and the Imperial Co. They, and they only, are named as the persons to perform the contract. From beginning to end of the instrument, if the contract be taken literally, there is not one word pointing to the continued existence of the contract in the hands of any other person either by succession or substitution. The obligations and benefits of the contract on the one side begin and end with Alfred Tolhurst; on the other, they begin and end with the Imperial Co. And yet the contract is to endure for a period of 50 years, or if the supply of chalk in the quarries does not hold out so long, it is to last for 35 years at least. Now, when it is borne in mind that the Imperial Co. must have been induced to establish its works at Northfleet by the prospect of the advantages flowing from immediate connection with Tolhurst's quarries, and that the contract in substance amounts to a contract for the sale of all the chalk in those quarries by periodical deliveries (less what Tolhurst might sell elsewhere), it is plain that it could not have been within the contemplation of the parties that the company would lose the benefit of the contract if anything happened to Tolhurst, or that Tolhurst would lose the benefit of the market which the contract provided for him at his very door in the event of the company parting with the undertaking, as it was authorised to do by its memorandum. Mr. Pickford said, and said truly, that those powers in the memorandum to which his attention was called placed the company in the position of an individual. That is so. But if the contract had been between two individuals—between Alfred Tolhurst and John Smith—I do not think there would have been any doubt about the matter. It is, I think, the introduction of a company—a body with perpetual succession, defined capital, and specified objects—as one party to the contract, that really creates or suggests the difficulty—that and the use of the word "their"—"their manufacture," "upon their land." But the word "their" in the case of the company must not be taken too literally any more than the word "his" in the case of Tolhurst where the contract speaks of "his" land. Something more is comprehended than the particular company and the individual Tolhurst. It seems to me that the contract is to be read and construed as if it contained an interpretation clause saying that the expression "Tolhurst" should include Tolhurst and his heirs, executors, administrators, and assigns, owners and occupiers of the Northfleet quarries, that the expression "company" should include the company and its successors and assigns, owners and occupiers of the Northfleet Cement Works, and that the words "his" and "their" should have a corresponding meaning. That, I think, was the plain intention of the parties. The contract is a contract for the mutual benefit and accommodation of the chalk quarries and the cement works, and of Tolhurst and the company as the owners and occupiers of those two properties. Construed fairly, the provision in Clause 2, about which there was so much argument, means, I think, nothing more than this—that the Imperial Company was to take the whole of the supply of chalk required for the Northfleet works (the quantity to be ascertained by daily orders, but guaranteed not to be less than 750 tons per

week) from Tolhurst's chalk quarries and from no other source whatever. As long as that is done, how can it matter who is carrying on the works? There is nothing in the contract to restrict the development of the works on the land which formerly belonged to the Imperial Company or to check the expansion and improvement in the ordinary course of things of the process of manufacture there. If the view I have expressed be correct, all difficulty vanishes. It is well settled that as a general rule the benefit of a contract is assignable in equity and may be enforced by the assignee. The assignor ought in ordinary circumstances to be made a party. But I cannot think that this is necessary when the assignor is a mere name, as the Imperial Company is in the present case, without any means and without any executive or board of directors, if indeed it has now any corporate existence. I am not aware of any authority for this proposition, but it seems to me to be in accordance with the practice in equity, and it is supported by what was said by James, V.C., in "*Castellan v. Hobson*" (10 Eq. 47). The result is that Tolhurst's action fails, because, as regards the chalk which has been supplied to the Associated Company, the company is entitled to have it at a stipulated price of 1s. 3d. per ton. The second action succeeds, but I think the Imperial Company was not a necessary or proper party. If the requirements of sections 142 and 143 of the Companies Act, 1862, have been complied with the company is "deemed to be dissolved," and therefore I should suggest that in lieu of the declaration in the order pronounced by the Court of Appeal there should be inserted a declaration to the effect that the Associated Company is entitled to the benefit of the contract of Jan. 5, 1898, they paying, as provided by the contract, for all chalk supplied to them in accordance with the contract. With this variation, I think the orders under appeal should be affirmed, and the appeal dismissed with costs. Lord Shand, who is unable to be present to-day, has asked me to express his concurrence in this opinion. Lord Robertson: I can explain in a few sentences what I find an insuperable objection to the judgment appealed against. It seems to me that the demand of the respondents is that the appellant should supply them with something different to that which he bound himself to give. The subject-matter of the contract is expressed to be the supply of 750 tons, and so much more chalk, if any, as should be required for the business of a particular company, while the demand of the respondents is that the appellant shall supply 750 tons and so much more chalk as is required for the business of another and a different company. The appellant's point is, therefore, not the bare one that the contract is not transmissible, but it is that the thing which the assign is asking for is something which the appellant never bound himself to give. Now, first of all, about the facts. It is true, or at least I assume it to be true, that the original company still exists in such sense that it can sue. But it is still more certain that it has finally ceased business; and it exists and comes into Court solely in order to enforce this contract (if it can) in favour of the new company. And the crucial fact (in my view) is that the original company is, as a manufacturer, dead and done with, and has no requirements large or small. The requirements which the appellant is now called on to meet are not the requirements of the old company, but the requirements of the new. It seems to me to be no answer to this to say that the old company might have increased its capital and its operations, so that its requirements would have been as onerous as those of the new company. This is merely the old and often rejected argument that a man can be forced to do something which he never agreed to, merely because it is very like and no more onerous than something which he did agree to. I have only to add that I should find it impossible to split up the subject of the contract, and to hold that, even if the appellant is not bound to meet the requirements of the new company, he is bound to give them the 750 tons. In a commercial contract like this the benefit of the more elastic provisions belongs to both parties, and neither the person who supplies nor the person who takes can be held to the one part of the contract when the opposite party has by his own act rendered the other part of the contract impossible of fulfilment." Lord Lindley: In January, 1898, Mr. Tolhurst, who was the owner of some chalk land in Northfleet, sold part of that land to the Imperial Portland Cement Co., and by an agreement dated Jan. 5, 1898, he agreed that they should have, for fifty years, from his adjoining chalk quarries, all such chalk as they should require for their cement works on the land they had bought. They were to pay 1s. 3d. a ton for all they wanted, and they bound themselves to take at least 750 tons a week. The company were not to come on to Tolhurst's land and get the chalk themselves. He was to get it and deliver it to them, and they were to pay him monthly for what was so delivered. Mr. Tolhurst was at liberty to sell chalk to other persons, and provision was made for the possible event of all his chalk being worked out before the expiration of the fifty years. The nature of the agreement and the time it was to last negated the

idea that it was confined to the parties to it. The word "assigns" does not occur in the agreement. But this does not show that the benefit of the contract is not assignable. An agreement for a lease, and even an option to require a lease or a renewal of a lease is assignable in equity, even although there is no mention of executors, administrators, or assigns. See "Backland v. Papillon" (L.R., E.J. 47, and 12 Ch. 67). My lords, if the above agreement had been with an ordinary individual his interest would, on his death, have passed to his executors or administrators; or if he had become bankrupt his trustees could have claimed it, and have sold it for the benefit of his creditors. It follows that on the same supposition he could have assigned such interest in his lifetime. The Imperial Co. could, in my opinion, have done the same thing; they could have assigned their interest themselves before winding-up proceedings commenced, and their liquidators could have assigned it as part of their assets afterwards. But it is necessary to look a little further and see what limit is set to the right conferred by the agreement. The Imperial Co. were not entitled to an unlimited supply of chalk, but only to so much as they might want for making cement or their own piece of land. I do not think their right to have chalk from Tolhurst's quarries could be assigned apart from their own land and cement works. The Imperial Co. could not by alienation or otherwise increase the burdens which Mr. Tolhurst undertook to bear. But this is the only limit which I can find in the present case. Mr. Justice Mathew thought that the mere fact that the Imperial Co. was a comparatively small company, and that the Associated Company was much larger, and would, or might, want more chalk than the other, involved a material increase in the burden thrown on Mr. Tolhurst. But the learned Judge apparently overlooked the fact that the Imperial Co. could have increased its capital to any extent; and could have increased its cement works to any extent which the land they had bought from Mr. Tolhurst could carry. The limit of the burden thrown on Mr. Tolhurst is in any case measured by this consideration, and this limit can no more be passed by the Associated Co. than by the Imperial Co. But then Mr. Peckford, in his very able argument, relied on the words "as the company shall require for the whole of their manufacture of Portland cement upon their said land." But throwing a strong emphasis on the words "the company" and "their," the impression may be produced that these words, which plainly refer to the Imperial Co., were purposely used to exclude all other persons. But I cannot think that these expressions indicate any such intention. There is no question here of any personal confidence or personal skill. There is no reason whatever for supposing that any personal element entered into the mind of either of the parties to the agreement, and I cannot find anything in it to prevent the Imperial Co. from assigning the benefit of it to any other company or to any individual. By so assigning it the Imperial Co. would not get rid of their obligations to Mr. Tolhurst; but the contract is one the benefit of which is assignable in equity quite independently of the Judicature Acts. The Judicature Act, 1873, section 25, clause 6, has not made contracts assignable which were not assignable in equity before, but it has enabled assigns of assignable contracts to sue upon them in their own names without joining the assignor. I cannot agree with the Court of Appeal in thinking that the Associated Co. could not sue Mr. Tolhurst on this contract without joining the Imperial Co. as co-plaintiffs. The supposed necessity of making them parties or of postponing their dissolution to enable the Associated Co. to sue as their assignees has, I think, obscured the true position of this parties. I see no such necessity. But the joinder of the Imperial Co., although unnecessary, has not increased the costs, and need not be further noticed. If Mr. Tolhurst has any provable claim against the Imperial Co., and if he is not too late, he can prove against it, and the liquidators can, if necessary, obtain the means of paying him from the Associated Co. under their indemnity. In conclusion, I will only add that the "British Waggon Co. v. Lea" (5 Q.B.D. 143) was, in my opinion, rightly decided, and is an authority very much in point for the Associated Co. The contract there was held assignable, although the word "assigns" did not occur. The appeal fails, and the order of the Court of Appeal should be affirmed with costs; but the formal order of the Court of Appeal will, I think, be improved if amended as suggested by Lord Macnaghten.

FACULTIES FOR STAINED-GLASS WINDOWS.—At Cranbrook, on Wednesday week, before Dr. Tristram, Commissary-General of the diocese of Canterbury, an application was heard for a confirmatory faculty, authorising the erection of the east window in Cranbrook parish church, which was set up in 1861 by Mr. Robert Lucas Tooth. The petition was opposed by the Vicar (the Rev. William Bell) and many parishioners. The window was erected without a faculty by Mr. Tooth, who had been for seventy years a parishioner of Cranbrook. In May, 1902, the Vicar stated to the vestry that something

must be done to the east window, which was out of repair. Mr. Robert Lucas Tooth, who resides at Grendon Park, Loughborough, Leicestershire, a grandson of the donor of the window, fearing that the window was going to be interfered with, presented a petition for a confirmatory faculty in September last; but the Vicar insisted upon his giving a new window, as the existing window was out of repair, and was wanting in artistic merit. Mr. Tooth offered to repair the window, but the offer was refused. The opponents, who included Lord Cranbrook and Lord Medway, did not ask for a removal faculty, or make any offer of a new window, and did not object to the east window being a memorial to the Tooth family, who were highly respected in the parish; but resisted the faculty on the ground that the window was defective in design and colour, and that a faculty might prejudice the chance of obtaining a more artistic window for the east end of the church. Mr. F. D. Hardy, artist, and resident in Cranbrook for fifty years, opposed on the ground that the window was wanting in grandeur of design, and the glass was inferior. The window was similar to other windows in the chancel, and set up by the same artist, Mr. O'Connor, who had been selected by Mr. Webster, R.A. The Rev. W. Bell then put in a plan of the window showing the gradual decay and perishing of the glass. Mr. Hardy stated that Mr. Tooth's offer to repair being declined if the faculty were not granted, he was told Mr. Tooth would not execute the repairs. The Commissary-General said he had never in his experience known a similar case. The lay rectors, who were the Dean and Chapter of Canterbury, were primarily liable for the repair of the chancel. If a new window was erected the inscription at the base must remain, as it was a memorial to the Tooth family. He would adjourn the case till Easter to see what the parish could do; and if the faculty was granted it would be upon terms.

IN RE JOHN HOWARD.—A first meeting of the creditors of Mr. John Howard, builders' merchant, 432 and 433, Kingsland-road, N.E., took place on Monday, under a receiving order made on July 17 last, on the debtor's own petition. The debtor states that he filed his petition in consequence of the lock-up of his capital in buildings which could not at present be realised. A draft statement of affairs was produced showing gross liabilities amounting to £17,973, of which £11,731 was expected to rank, and a deficiency of £6,315. It was resolved that the matter should be wound up in bankruptcy by Mr. R. J. Ward, chartered accountant, as trustee, with the assistance of a committee of inspection.

A LONG-ACRE ARBITRATION.—In the Westminster High Bailiff's Court, on Monday, Mr. John Troutbeck and a special jury had before them the case of "Sergeant v. The Great Northern, Piccadilly, and Brompton Railway Company." It was a claim by Mr. Arthur Sergeant, a baker, carrying on business in Long-acre, for compensation for the compulsory acquisition of his leasehold interest in his premises, which are required for the purposes of the new Covent Garden Station, the lease being 20 years unexpired. By an agreement arrived at between counsel, the plaintiff agreed to accept a verdict for £1,750, remaining in possession for two months as from last Friday, and taking away all the fixtures and the fittings, which were to remain his property. By direction of the high bailiff the jury returned a verdict in the terms stated.

A new Primitive Methodist church was opened at Oulton, near Lowestoft, last week. It has been built from plans by Mr. F. W. Richards, M.S.A., of Lowestoft. The new edifice is 40ft. long and 25ft. wide inside, and 14ft. high at the plate, and 21ft. from floor to ceiling at the collar level. It has an open roof, with principals. The building is ventilated with Messrs. Boyle's roof ventilators, and also by wall fresh-air inlet tubes, and lighted on both sides and at the front. The building is faced with red bricks, and the front is relieved with white Chertsey ware dressings. The contract has been carried out by Mr. J. S. Younge, builder, of Oulton Broad, and the cost has been £700.

There is renewed probability that the Theatre Royal, Birmingham, will be rebuilt. Messrs. Ernest Runtz and Co., the architects of the new Gaiety Theatre, have been entrusted with the preparation of the plans, and of the row of shops fronting upon New-street, which will be in a style of architecture consonant with that of the playhouse, part of which will stand above the business premises.

In Winner-street, Paignton, last week, the memorial-stones were laid of new Baptist Sunday-schools. Messrs. Briggman and Bridgman are the architects, and the erection of the building has been entrusted to Mr. R. Harris.

The Primitive Methodists of Crowland have completed their building scheme. A commodious schoolroom, adjoining the chapel, with classrooms, vestries, and outbuildings, has been erected, at a cost of £350.

STATUES, MEMORIALS, &c.

CREWE.—The Crewe War Memorial was unveiled on Saturday. The monument has been executed by Messrs. J. Whitehead and Sons, of Westminster. It is of Aberdeen granite. Two steps on either side lead up to a square block with four panels in bronze, on which the officers' and men's names are inscribed who left the town of Crewe to do duty in South Africa. The monument tapers towards the top, and finishes with an Ionic capital on which stands a bronze figure of a soldier, with rifle, bandolier belt, pouch, and water bottle. On the front of the monument stands a model in bronze of the latest type of 7ft. four-wheeled-coupled compound engine designed by a Crewe workman, Mr. J. H. Lightfoot. The whole stands on a base 16ft. square, surrounded by a granite kerb with two full-sized lions on either side.

NEWPORT.—The unveiling of the Island memorial to Queen Victoria at Newport, Isle of Wight, took place yesterday, by Princess Henry of Battenberg. An address from the Memorial Committee was read by the chairman, and presented to the Princess. H.R.H. then unveiled the memorial, the architect (Mr. Percy G. Stone) handing H.R.H. a silken cord for the purpose. The memorial takes the form of a Victoria Cross on a tall, graceful column, the figures at the base representing the regal virtues of Dignity, Fortitude, and Sympathy upholding the crown, and guarded by the lions of England. We illustrated and fully described the cross in our issue of July 11, 1902.

PLYMOUTH.—Another war memorial was unveiled at Plymouth on Saturday. The canopied and moulded base of the obelisk, of green Swedish granite, weighs about seventeen tons, and contains bronze panels on each of the four sides of the monument each 4ft. 4in. wide and 3ft. 10in. high. The Prince Christian Victor panel is the work of Mr. Emil Fuchs. The Devon, Gloucester, and Inscription panels are by Mr. Onslow Whiting. The casting of all four panels is the work of Mr. Enrico Cantoni. Carved in granite on each side of the bronze panels are smaller panels containing names of the principal engagements in which the Prince Christian, the Gloucesters, Somersetshire, and Devon Regiments took part. The shaft or obelisk above the base is of red Swedish granite, ornamented with sunk polished plates and bands finely axed on all four sides, surmounted by the Greek honeysuckle ornament. The whole of the polished granite was worked in Aberdeen. The design is by Mr. F. W. Marks, architect, of London.

CHIPS.

The will, dated June 30, 1903, of Mr. Benjamin Ebenezer Nightingale, builder and contractor, of the Albert Works, Albert Embankment, who died on July 17, was proved on July 25 by Thomas Thompson and Frank Taylor, the executors, the value of the estate being £23,894.

The death occurred on the 8th inst. of the wife of Mr. R. Clarke Edwards, F.R.I.B.A., of 37, Norfolk-street, Strand, W.C. Mrs. Ada Edwards, who was 55 years of age, died on the 26th anniversary of their wedding day, at their residence, 55, Buckland-crescent, Hampstead.

The Paviers' Company is gradually, but none the less surely, going down hill as far as numbers are concerned. A year ago the strength of the Livery was nine, but now, as stated in last week's *City Press*, it is only eight. There can be but one end—the extinction of the Guild altogether, and the forfeiture of its charter—unless there is a speedy revival.

The new central premises of the Weights and Measures Department of Glasgow Corporation in Parnie-street, Glasgow, were opened last week. The new premises, which have been provided by the local authority, have been erected according to a plan prepared by Mr. A. B. Macdonald, city engineer.

The Heston Schools, Isleworth, are being warmed and ventilated by means of Shorland's patent Manchester stoves with descending smoke flues and patent Manchester grates, the same being supplied by Messrs. E. H. Shorland and Brother, of Manchester.

At a meeting of the Ludlow Town Council on Thursday, it was decided to make application to the Local Government Board for powers to borrow £8,250 for carrying out a scheme of electric lighting, and for the purpose of a refuse destructor. The scheme has been prepared by Mr. John Parker, Hereford, and the corporation has already consulted an expert upon the details, his opinion being entirely favourable. A new general district rate of 1s. 4d. in the pound was levied.

The new church of St. Mary the Virgin, Corsley Wilts, which has been erected and endowed by bequest of Mrs. Fletcher Barton, was dedicated by the Bishop of Salisbury on Thursday week. The cost of the building has been about £5,000. A choir of £5,000 has been left for endowment.

NEW PREMISES, HOLBORN.—UPTON COTTAGE, SLOUGH.—DESIGN FOR LIVERPOOL CATHEDRAL.—PROPOSED CLERGY HOUSE.—R.L.B.A. PUGIN TRAVELLING STUDENTSHIP DRAWINGS.—HOLLINGTON HOUSE.—DESIGNS FOR A BAND STAND AND REFRESHMENT ROOM.

Our Illustrations.

NEW PREMISES, STAPLE INN, HOLBORN.

MESSRS. ALFRED WATERHOUSE, R.A., AND SON are the architects of this new block of offices, the ground floor of which is occupied by the bookshop of Mr. Bumpus. Adjoining is the famous range of timbered old houses forming the frontage to Holborn of Staple Inn. Mr. Waterhouse renovated these historic buildings a few years since with considerable care and good taste so as to preserve their ancient character. Our illustration is taken from a view made by Mr. C. W. English, who has offices in the building which forms the subject of this double-page plate. The work is in terracotta, and may be said to be typical of Messrs. Waterhouse and Son's designs.

UPTON COTTAGE, SLOUGH.

This house contains on the ground floor large hall, drawing-room, dining-room, morning-room, pantry, kitchen, scullery, storeroom, and knife and boot-room and usual offices. On the first floor five bedrooms, dressing-room, bathroom, h.m.c., and w.c.; on the second floor three bedrooms and two large storerooms, and one store-cupboard in roof. Externally the house is finished in roughcast, with a picked stock plinth. All roofs are covered with Hartshill sand-faced red tiles. The contract was let for £2,100 to Mr. James Carmichael, Wandsworth, London. The architect is Mr. W. H. Raffles, 10, Gray's Inn-square, W.C.

LIVERPOOL CATHEDRAL.

This is the concluding plate of our series of illustrations of Mr. Malcolm Stark's design for this church. During the last month or so we have printed most of his drawings, and those published herewith show sections of the nave and choir of the cathedral as proposed by this architect. Both details represent the church looking towards the high altar, the larger section showing the sides of the transepts and base of the flèche over the crossing. The previous plates of this design were given in the BUILDING NEWS for June 5, June 19, July 10 and 24, this year.

PROPOSED CLERGY HOUSE.

This drawing was recently exhibited at the Building Trades' Exhibition. It is intended to erect the clergy house, shown by the view and accompanying plan, in the West Central district. The materials proposed to be employed are yellow stock facings, with stone sparingly used, and plastered bays, the whole being very quiet in design, and effectively treated for a narrow street. Mr. Sidney B. Caulfield is the architect.

PUGIN TRAVELLING STUDENTSHIP DRAWINGS, R.L.B.A.

A WEEK or two since we gave a selection from Mr. C. Wontner Smith's studentship drawings, and we now give others. Fairford Church is princi-

pally remarkable for its fine stained glass, and it contains quite a number of really beautiful windows which are almost intact. This is accounted for by the fact that at the Reformation the glass was buried or hidden away, and only brought back when all danger of its destruction had passed. The church itself is of much interest, being chiefly in the Perpendicular style, and contains, amongst other features worthy of notice, some fine wooden screens and choir-stalls. Gloucestershire contains many old manor-houses dating from the 17th century, and although the one at Upper Swell does not compare with many in size and importance, yet it is a charming place. The work generally is simple in character, which is typical of the district. In one of the upper rooms there is an interesting fireplace with a projecting stone hood, carried on brackets and supported by pilasters. The hearth is composed of slabs of marble in squares, alternately black and white. Unfortunately, the whole of the overmantel has been treated with a coat of cream paint. In this room also is a fine modelled plaster ceiling and frieze.

HOLLINGTON HOUSE.

We much regret that, owing to the absence of the architect, Mr. Arthur Blomfield, we are unable to give particulars of this house to-day.

"BUILDING NEWS" DESIGNING CLUB: A BAND STAND AND TEA PAVILION.

(For description, awards, and further sketches, see pages 198-9.)

CHIPS.

The borough council of Hampstead have decided to spend £25,339 in extending the accommodation for the works department.

At a vestry meeting held in the Abbey Church vestry, Hexham, it was agreed that application be made to the Chancellor of the Diocese for a faculty to fill the northward window of the aisle of the south transept of the Abbey Church with painted glass as a memorial to the late Canon Barker.

The harbour board of Aberdeen, at a meeting on Monday, had under consideration a scheme for wharfing 800ft. of the north bank of the river Dee, from the eastern extremity of Point Law westwards to Ferry Place, at an estimated cost of £12,750, with the view of accommodating herring fishing vessels. The Board unanimously adopted the scheme, and a remit was made to the harbour engineer to report as to wharfing the remaining portion of the river east of Victoria Bridge.

A mission church of St. Stephen is about to be built at Seaton Delaval. The architect is Mr. C. S. Errington, of Grainger-street West, Newcastle.

The appointment of Mr. R. A. Chattock, at present electrical engineer to the Bradford Corporation, to the post of electrical engineer for the city of Birmingham, at a salary of £1,000 per annum, has been confirmed by the corporation of the latter city.

Last week the Bishop of Bath and Wells visited Lydeard St. Lawrence and dedicated the restored screen in the parish church. This ancient screen, which dates from the early years of the 14th century, has been restored to commemorate the Coronation of the King.

Sir Edward Fry, Sir Hugh Owen, and Sir John Wolfe Barry, the arbitrators under the Metropolitan Water Act, announce that the sitting of the Court on October 26 will be held in the hall of the Institution of Mechanical Engineers, Storey's-gate, Westminster.

Three German carpenters who were passengers by the *Gera* and were going out to New South Wales under contract to the Chillagoe Co., were not allowed to land on Tuesday, pending an inquiry as to whether they are skilled labourers within the meaning of the Act excluding unskilled labourers arriving under contract. On Wednesday Sir Edmund Barton allowed the three men to land at Melbourne, having satisfied himself that they possessed the special skill required, and that the restrictive clauses of the Act did not apply.

The Teddington Council, on Monday, received and accepted an offer of £1,000 from Mr. Carnegie to build a free library. It was decided that the present library premises should be given up, and a new library erected near the Council Offices on town property.

Several members of the London Geologists' Society, who are at present touring the country, visited the Fulwell quarries and the Claxhaugh Rock, near Sunderland, on Saturday, being conducted over the former by Mr. George Abbott, M.R.C.S., F.G.S., and at Claxhaugh by Mr. David Woolcott, M.Sc., F.G.S., of Sunderland.

COMPETITIONS.

ACTON.—The Middlesex County Council Education Committee, on behalf of the governors of the Acton County School, have decided to invite the following architects to prepare plans in a limited competition, the designs to be submitted by November next: Messrs. Maurice B. Adams, Clay, Giles Gough and Trollope, Pratt, Pywell, Osborne Smith, and A. H. Tiltman. The cost is to be about £8,000.

FLAMBOROUGH.—The competition for the best scheme for the local water supply has resulted in the adoption of the plans of Messrs. Elliott and Brown, of Nottingham. Fourteen schemes were submitted.

GLASGOW.—In the competition instituted by the corporation for designs for a branch free library for Bridgeton district, the successful architect is Mr. James R. Rhind, of Inverness.

GREAT HARWOOD.—The first place in the limited competition for new central co-operative stores, shops, and public hall, to cost £11,000, has been awarded to Mr. Fred J. Parkinson, architect, of 9, Richmond-terrace, Blackburn.

The new buildings erected at Furnace-road school, Muirkirk, N.B., at a cost of over £3,000, were formally opened on Monday by Mr. Baird, M.P.

New schools in Forsyth-road, West Jesmond, are about to be built for the Newcastle-on-Tyne school board from plans by Mr. Charles S. Errington, A.R.I.B.A., of that city.

The new dock built for the Government of Natal by Messrs. C. S. Swan and Hunter, Wallsend-on-Tyne, to replace the one lost on its passage to Durban about a year ago, was successfully launched on Saturday.

The cottage homes erected by the Newcastle-on-Tyne Board of Guardians at Ponteland will be opened on Sept. 10. Messrs. Oliver, Leeson, and Wood, of Newcastle, are the architects, and Messrs. E. Henderson and Son, of Ponteland, the contractors.

The memorial-stone of the new Nottingham Gordon Home for Boys, which is being erected in Cranmer-street, was laid with Masonic ceremonial on the 5th inst. by the Duke of Portland, K.G., Grand Master of the Nottingham Province. The home is being erected from plans by Mr. Ernest R. Sutton, of Bromley House, Nottingham. Mr. F. Essom is the builder.

A new place of worship, belonging to the Free Church of the Welsh, was inaugurated on Saturday in Cloughton-road, Birkenhead. It is built of brick in the Gothic style, with frontings of red Ruabon terracotta. The large hall has seating for 450 people, and attached are schoolroom, classrooms, and vestries. The electric light has been installed throughout. Including the land, the total cost is estimated at £3,000. The architect was Mr. T. Taliesin Rees, of Birkenhead.

In a large series of timber tests carried on at the University of Buenos Aires, the test pieces for the tensile tests were simple rectangular strips, 5cm. by 2cm. by 50cm., and the ends were held between the jaws of the testing-machine by means of wooden wedges. The wedges had a bearing on the test piece for a length of 12cm., thus leaving a free length of some 26cm., say 10in., at the middle of the test piece. All the specimens tested broke in this free length, and not under the wedges.

The new public baths in Maze-street, Barton Hill, Bristol, built at a cost of £17,000, were formally opened on Monday. The swimming-bath is 75ft. by 30ft., the water being 3ft. 6in. deep at one end and 6ft. 6in. deep at the other. A shower-bath and foot-baths are also provided, while there are 43 dressing-boxes. A specially-designed water-chute can be readily removed or simply raised when swimming competitions are on. A gallery for spectators is provided over the dressing-boxes, giving 250 seats. In the winter time the swimming-bath will be converted into a public hall by flooring over the bath at gangway level.

An inquiry was recently held at Tenterden by Colonel G. F. O. Boughey, R.E., C.S.I., and Mr. Henry Allan Steward (Light Railway Commissioners), into an application for an extension of time for making the suggested line to Cranbrook, for the diversion of certain footpaths adjoining Tenterden Station, and for the substitution of cattle guards for gates at the level crossings at Rolvenden Station and on the Cranbrook-road.

The quarterly central board meeting of the National Association of Master Plumbers was held in the council chamber of the town-hall, Scarborough, on Monday. A welcome was extended by the mayor (Mr. W. Morgan). A finance committee was elected consisting of Messrs. J. Skirrow, Leeds; Slater, Huddersfield; and P. Shipley, Bradford.

Designed by SOLO

Two musical staves with handwritten notes. The top staff contains a series of notes, some with stems, and a signature 'J. S. Bach' at the end. The bottom staff contains a series of notes, some with stems, and a signature 'J. S. Bach' at the end.

WATER SUPPLY AND SANITARY MATTERS.

BARROW: THE DUDDON WATER SCHEME.—One of the difficulties with regard to the right of way for the Barrow pipe track has been overcome. When Messrs. Aird and Company commenced operations at Foxfield they began to lay a tramway, but the work came to a sudden stop when a piece of land owned by the Furness Railway Company was reached. The piece of land is that on which the original line from Whitehaven to Broughton was laid. The rails were taken up when the enterprise was transferred to the Furness Railway Company. Over this narrow strip difficulties arose with regard to the laying of Messrs. Aird's tramway. An arrangement has been come to, the contractors receiving intimation that terms have been agreed to with the Furness Railway Company, so that the work can now go on.

LEEDS WATER SUPPLY.—**LORD MASHAM AND THE LEEDS CORPORATION.**—Lieut.-Colonel W. H. Wellsted, M.L.C.E., of Hull, has issued his award in the above, amounting to £46,489. The claim was in respect of 395 acres of freehold land on the Swinton Estate, the seat of Lord Masham, taken for the construction of the Colsterdale and Leighton reservoirs and the easements required for the catchwater and two aqueducts for a length of over seven miles. The claim was put by the claimant's witnesses at £196,000, which was also for consequential damage during the construction of the works and afterwards to Swinton Castle, and the interference with the sporting rights, shooting, and fishing on the remainder of the estate and the timber. The valuations of the witnesses called by the corporation amounted to £27,000. The arbitrator for the claimant was Mr. Thos. Fenwick, C.E., Leeds, and the witnesses were Messrs. G. R. Strachan, C.E., London; John Maughan, F.S.I., Middlesbrough; C. L. N. Maister, Masham; John Farrah, F.S.I., Halifax; Fred Punchard, F.S.I., Kendal; Thos. J. Wainwright, F.S.I., Liverpool; F. G. Chinnock, F.S.I., London; and F. Fowler, F.S.I., Sheffield. The arbitrator for the Leeds Corporation was Mr. Chas. Gott, C.E., Bradford, and the witnesses were Professor Boyd Dawkins, Victoria University; Henry Roife, C.E., Westminster; C. H. Hill, C.E., Westminster; E. J. Silcock, C.E., Leeds; E. L. Clare, F.S.I., Leeds; Walter Middleton, Shipley; and J. H. Hanson, F.S.I., Huddersfield.

MARGATE.—The new water undertaking of Margate, which has been carried at a cost to the town of over £120,000, was inaugurated on Aug. 6 by the mayor. The site of the new pumping station is a mile south of Wingham, 14 miles from Margate, and the supply found is so plentiful that instead of driving adits for 3,000 yards, only 1,200 yards have been constructed, and a supply of 3,000,000 gal. daily is now available. The water is pronounced to be absolutely pure. The quantity at present required is 1,250,000 gal. daily, and the supply can be further extended at any time, for the corporation possess powers to drive adits for three miles. The scheme was prepared and carried out by Mr. Albert Latham, late borough engineer.

CHIPS.

The stone-laying of a new meeting-hall and classrooms in connection with the Providence United Methodist Free Church, Broadgate-lane, Horsforth, took place on Saturday. Mr. Mostow is the architect.

It has been found necessary to strengthen the tower of the ancient Norman church at Dover Castle.

The corner-stone of the new memorial chapel, which is to form a wing of Lancaster Parish Church, and is being erected in memory of the officers and men of the King's Own Royal Lancashire Regiment who fell in the recent South African War, was laid on Friday by the Countess of Derby. The cost of the chapel will be £3,500.

The contract for four electric lifts and two hydraulic lifts in the extensive new premises of Messrs. Robinson and Cleaver, Regent-street, W., has been awarded to Messrs. Wm. Aug's Gibson, Ltd., 25, Fleet-street, E.C.

The Duke of Argyll has formally opened the new Ganavan-road at Oban. The road commences at the west-end of the Dunollie Esplanade, of which it forms a continuation, and it winds round the base of the rock on which Dunollie Castle is built, and beyond it till it reaches Ganavan bathing beach, for which it provides a carriage access. It skirts the sea for the whole distance of two miles. The whole roadway is northward of and outside the burgh boundary, but the cost has been borne by the town.

Seaweed or seagrass paving-blocks, recently invented, are being tried in Baltimore, U.S.A. They are made by compressing the seaweed until it becomes hard and solid, when it is bound tightly with wire. The loose ends of the grass are cut off, and the block is finished by being immersed in boiling pitch or tar.

Our Office Table.

WE feel there is little need to endorse the appeal of the President of the A.A. in our correspondence columns this week for assistance towards defraying the cost of adapting and improving its new premises. Five thousand pounds ought to be raised easily by the profession in aid of so advantageous a step. Always progressive, nearly always up to date, and inheriting a record of mutual usefulness and good- comradeship unsurpassed by any similar professional association in the kingdom, its latest development ought to enlist the promptest recognition and tangible acknowledgment. There are those to-day who are advocating a "National School" for budding architects. Properly supported, the A.A. has every claim to be regarded as such, and its future, in any case, will, we are sure, do credit to its past, which has been that of a fruitful training institution for the ablest of our architects, and the best possible fostering influence of professional *esprit de corps* and good-fellowship.

THE report of the Ordnance Survey, just issued, shows that considerable progress was made with the work of the department during 1902. The most important achievement was the completion of the one-inch hill-map of the United Kingdom. This map has been in hand for many years, but had been quite unavoidably delayed, although the similar compilations for Ireland and Scotland had been completed in seven and nine years respectively. The report points out the tremendous amount of labour involved in the production of such a map as this. For instance, there are 360 sheets in England, 205 sheets in Ireland, and 131 in Scotland. A single sheet of full size takes between one and two years to engrave, and it takes from four to six months to make the hill-drawing from field sketches. This is, of course, but a portion of the whole of the Ordnance Survey during the year. The renewed military activity consequent on changes of policy at Pall Mall has created a heavy demand on the part of the War Office, and a series of maps on a two-miles-to-the-inch scale has been undertaken. It is gratifying to learn that the large scale revision is proceeding at a rate which will enable the whole country to be revised once in twenty years.

MR. G. H. FOSTER, surveyor to the rural district of St. Columb Major, has received the following letter from Marlborough House, dated July 27, 1903:—"Dear Sir,—I have very much pleasure in saying that on the occasion of their Royal Highnesses the Prince and Princess of Wales journeying through your district the road throughout was very good.—Yours faithfully, ARTHUR BIGGE, Private Secretary." We congratulate Mr. Foster and his Royal Highness the Prince of Wales. An expression of opinion like this is a sensible and laudable one, and quite as much the due of some of us who contribute to the real public and Royal comfort as similar acknowledgments to civil and military authorities who take more showy, but perhaps less useful, parts in public welcomes and rejoicings.

THE oldest church organ which has come down to our own day in anything like its original condition is said by the *Daily News* to be that which is now in Barnsbury-street Congregational Chapel, Islington. It was built in 1660 by Bernard Schmidt, for Westminster Abbey, and its original cost was £120. It was placed above the stalls on the north side of the choir, and was played upon by Blow, Purcell, and Croft. In 1730 it was removed to make room for Shreider and Jordan's organ, and sold to the parish of St. Margaret's, Westminster. After being stored for many years in the tower there, it was re-erected in Barnsbury Chapel by Holditch, who added two octaves of pedal pipes outside the ends of the old case, and made some other slight alterations; but except for the additions mentioned, Schmidt's work remains practically intact.

AT Marlborough-street last Friday, in fining a scavenger (who had been previously convicted) 20s. for "rummaging" in dust-bins in streets in the West End, Mr. Denham remarked that it had been a matter of wonder to him for years that in the heart of the wealthiest city in the world there was no better method of removing refuse than the one now used, which would have been almost disgraceful in the Middle Ages. These large metal boxes of filth were stood in the footway to the danger to health and to the inconvenience of the public, and when they were

routed over by such persons as the defendant the trouble was increased tenfold.

THE Hon. W. Fred D. Smith, M.P., writes to the daily Press explaining the position in which the suggestion to move King's College Hospital to another site now stands. During the present summer a special committee of gentlemen unconnected with either the college or hospital was appointed to consider the question of a change of site; that committee reported strongly in favour of removal; and their report has been already adopted by the council of King's College and the committee of the hospital, two of the three bodies whose consent is necessary before any active steps can be taken. There remains the body of governors, whose decision will be taken early in the autumn. Meanwhile, a joint committee, of which Mr. Smith, M.P., is the chairman, has been appointed by the council of the college and the committee of the hospital; and if the decision of the governors is favourable to removal, immediate steps will be taken to collect the very large sum of money, probably amounting to £300,000, which will be required to install the hospital on a new site.

MR. W. RUSKIN BUTTERFIELD, of St. Leonards-on-Sea, states that during the last few years he has found large numbers of specimens of worked flints on the high ground in the neighbourhood of Fairlight Church, near Hastings. For the most part, the implements do not exhibit very elaborate workmanship, and Mr. Butterfield has found only two polished examples, both of which closely resemble implements from the South Downs near East Dean. Other specimens are identical in shape and working with the diminutive forms found by Mr. Lewis Abbott in the Hastings "Kitchen Middens," and figured in the *Journal of the Anthropological Institute*, Vol. XXV. pl. x., xii., xiii. The single fragment of pottery found appears to have formed part of the rim of a round vessel. It is ornamented with a number of regular oblique parallel lines.

THOMAS SMITH, aged 42 years, a bachelor stone-cutter of Reading, Pa., U.S.A., recently died at that city of inflammatory rheumatism. For years he was a recluse. He left a will, declaring that his £1,600 estate should be turned into money and be expended for a monument over his grave, as follows:—"I direct that a model of a statue of a man 5ft. high shall be erected and put on the top of my monument, and said statue shall stand upon a rough rock, and the reason why I want this said monument in the way or style in which I direct it to be made, is because I worked at the same trade near all my lifetime." Why "Tommy" should stipulate that the man mounted upon the rock should only be 5ft. high is not apparent!

A new edition of their catalogue of fire-escape iron staircases, doors, verandahs, balconies, and roofs has just been issued by the St. Pancras Ironwork Company, Ltd., 171, St. Pancras-road, in which several new features appear of interest to architects and others. The new patent non-slipping tread for staircases is a very important feature. It consists of a slab 1½ in. thick, made of steel imbedded in a peculiar manner in a special kind of concrete, on the wearing surface of which a series of lead rings is inserted. The slabs are made 10 in. from back to front and 12 in. wide, and half-slabs 6 in. wide. They drop into a rebate at the top and bottom of adjoining risers, the front edge being protected by an iron nosing. Their strength is very great: one slab a month old stood with 25 cwt. on it. These slabs can be used on both wood and stone steps, and enable a worn staircase to be turned into a new and safe one. Several illustrations of staircases, one on rolled iron girders, doing away with columns, and others made for H.M. War Office in barracks and prisons, double staircases with wrought-iron ornamental balusters, and external fire-escape staircases for fixing outside public buildings are shown. Other examples of ironwork to factories, &c., covered bridges, porches and verandahs, iron roofs, domical structures, and lift inclosures afford many suggestions of value.

The Bishop's Stortford Urban District Council have decided to acquire a site, at a cost of £4,000, for the erection of new public offices and a depot.

In the course of the storm on Tuesday, the hexagonal spire of Eton Church, near Peterborough, was seriously damaged by lightning. The weathercock, with several feet of masonry, became dislodged, and fell on the roof. The steeple was split for a considerable way down.

Trade News.

WAGES MOVEMENTS.

AMALGAMATED CARPENTERS AND JOINERS.—In the August report of the Amalgamated Society of Carpenters and Joiners, Mr. Chandler, the secretary, says:—"Judging by the numbers returned as unemployed the state of trade is not in that flourishing condition which we usually hope for and expect to find at this period of the year, and the fact that in none of the preceding months have our reports shown less than 1,500 on the books, and have even reached a total of 3,452, we may reasonably anticipate that our liabilities under the heading of unemployed benefit will again be exceedingly heavy. This experience appears general in its character, affecting both the house and shipbuilding industries, as apart from about 250 who are outside the United Kingdom, the remainder is made up by members in this country." The total membership of the society is now 72,185, and at the end of July 2,015 were on unemployed benefit, and 1,313 on sick. The available cash balance—the value of property appears only in the annual report—was at the end of June £152,255 11s. 8½d., as compared with £151,027 10s. 1½d. in March, and £169,527 7s. 5½d. in June, 1902.

BRADFORD MASONS' DISPUTE.—Sir William Markby, who has been appointed by the Board of Trade, at the request of the Mayor of Bradford, to act as arbitrator in the masons' dispute, heard evidence, on Monday, on behalf of the masons and the men. The matter in dispute has reference to the agreement which was arrived at at the conclusion of the last strike, to the effect that society men should do no more than use "moral persuasion" to induce the non-unionists to join their ranks. The trade unionists now say that this agreement operates to their disadvantage, and at the beginning of the year gave a six months' notice in reference to this clause. The notice expired at the end of last month, but no action was taken, as it had been mutually decided to submit the matter in dispute to arbitration. It is expected that the arbitrator will give his award in a few days.

SUNDERLAND.—The Sunderland house joiners have refused to accept the terms of the mayor. The suggestions were that the men should withdraw their application for an advance of ½d. per hour, that the masters should withdraw their notice of a reduction by the same amount, that the men resume work at the old rate (9½d. per hour), and that the question be considered three months hence.

With a view of endeavouring to prevent that portion of Great Clowes-street, Salford, known locally as the Cliff, from slipping into the Irwell, the corporation have decided to expend £5,551 upon the operation.

The work of restoring the fine old parish church of Hawarden has commenced. The roof and steeple are undergoing renewal or repairs, and some of the vaults in the body of the church have been filled with concrete. The cost will be £550.

CAUTION. USERS OF PORTLAND CEMENT SHOULD BEWARE OF CEMENT **ADULTERATION**

Many Cements of British and Foreign manufacture contain Rubbish of all Descriptions, such as GYPSUM, KENTISH-RAG STONE, BRICK-RUBBISH, SAND, FURNACE-CLINKER, &c., to an extent in some cases of 25 per cent.

PURE PORTLAND CEMENT—the only Cement which will stand the test of time—is made solely from CHALK and CLAY.

*INSIST ON HAVING A GUARANTEE THAT NO MATERIAL
OF ANY KIND HAS BEEN ADDED TO THE CEMENT
AFTER LEAVING THE KILNS.*

THE **RED-CROSS BRAND** IS

Pure, Well Burnt, Finely Ground, of High Specific Gravity and Tensile-Strain, and is specially adapted for use in Sea-Water.

It is guaranteed to be made solely from CHALK and CLAY without admixture.

THE **RED-CROSS BRAND** IS

Manufactured on the River Thames, at
LION WORKS, WEST THURROCK, ESSEX,
BY THE

WOULDHAM CEMENT CO.

FENCING AND WALLS.

Pontypriidd—Retaining and Fence Walls (310 yards)	Urban District Council	P. R. A. Willoughby, A.M.I.C.E., Surveyor, Pontypriidd	Aug. 17
Gillingham—Brick Wall	Urban District Council	F. C. Boucher, Clerk, New Brompton, Kent	19
Portsmouth—Fence and Gates to Allotment Grounds	—	The Borough Engineer's Office, Town Hall, Portsmouth	19
Leeds—Fencing over Culvert, Cross Stamford-street	—	The City Engineer's Office, Municipal Buildings, Leeds	19
Manchester—Setting-back Entrance Gates at Cemetery	Parks Committee	The City Architect, Town Hall, Manchester	19
Penrith—Dry Stone Wall (116 rods)	Rural District Council	Thomas Watson, Surveyor, Kirkoswald	21

FURNITURE AND FITTINGS.

Rustington—Furniture, &c., to Millfield	Metropolitan Asylums Board	T. Duncombe Mann, Clerk, Embankment, E.C.	Aug. 17
Burnley—Furnishing Hareher Clough Council Schools	—	A. J. Shaw, A.R.I.B.A., and T. E. Vowles, A.R.I.B.A., Burnley ..	23
Fudsey—Re-seating Wesleyan Chapel, Church-lane	—	Danby and Simpson, Architects, 10, Park-row, Leeds	—

PAINTING.

Crewe—Street Lamp Columns (700)	Electric Lighting Committee	H. H. Denton, Electricity Works, Elton-road, Crewe	Aug. 15
Mansfield—Post Office, Market-street	Corporation	R. Frank Wallace, Borough Surveyor, Mansfield	17
Glasgow—Crosshill and Govanhill District Library	Corporation	G. B. Walker, Measurer, 65, Bath-street, Glasgow	17
Llandilo-fawr—Parish church	Urban District Council	David Jenkins, F.R.I.B.A., Architect, Llandilo	19
Wellington—Office, House, and Outbuildings	Mrs. E. Bashforth	G. Riley, Surveyor, 45, Walker-street, Wellington, Salop	19
Wombwell—Six Houses, Hough-lane	Guardians	A. B. Linford, Architect, Carlton Villa, Wombwell	20
Leeds—Union Infirmary, Beckett-street	Rural District Council	James H. Ford, Clerk, Poor-Law Offices, Leeds	21
Pershore—Jubilee Bridge	Urban District Council	W. Bullcock, Surveyor, Wick, Pershore	25
Northfleet—Fencing (700 yards)	Urban District Council	J. Honeycombe, District Surveyor, Council Offices, Northfleet	25
Northfleet—Cemetery Buildings and Council Offices	Urban District Council	T. Clement Williams, F.R.I.B.A., 29, Southgate, Halifax	27
Halifax—Block at Gibbet-street Workhouse	—	T. Trevor Williams, Surveyor, Alexandra-road, Swansea	—
Swansea—Smallpox Hospital, Garmgoh Common	—	W. H. Jowett, Craig Vale House, Morley	—
Morley—Market Hall	—	—	—

PLUMBING AND GLAZING.

Dundee—Extension of Offices, &c.	Gas Commissioners	Alex. Yeill, Engineer, Gasworks, Dundee	Aug. 15
Glasgow—Crosshill and Govanhill District Library	Corporation	G. B. Walker, Measurer, 65, Bath-street, Glasgow	17
Portsmouth—Plumbing Work	Corporation	A. Hellard, Town Clerk, Town Hall, Portsmouth	23

ROADS AND STREETS.

Southend-on-Sea—Making-up Streets	Corporation	E. J. Elford, M.I.M.E., Borough Surveyor, Southend-on-Sea	Aug. 17
Balgray—Streets, &c.	James Lindsay	Gilbert Thomson, C.E., 161, Bath-street, Glasgow	17
Romford—Roadmaking	Rural District Council	E. G. Boden, Surveyor, Victoria Chambers, Victoria-road, Romford ..	17
Halifax—Private Improvement Works	Halifax Corporation	James Lord, C.E., Borough Engineer, Town Hall, Halifax	17
Basford, Notts—Widening Road	Rural District Council	Geo. W. Hawley, Surveyor, York Chambers, King-st., Nottingham ..	17
Leatherhead—Road Improvements	Urban District Council	T. Salkield, Engineer, Council Offices, Leatherhead	18
Wimbleton—Tar-Paving Playgrounds, Dundonald-rd, Schools	Education Committee	Thomson and Pomeroy, Architects, Hill-road, Wimbleton	19
Barnsley—Works, New Bridge-street	Town Council	J. Henry Taylor, M.I.C.E., Boro' Sur., Manley House, Barnsley ..	19
Manchester—Setting Back Gates at Philips Park Cemetery	Parks Committee	City Architect, Town Hall, Manchester	19
Wimbleton—Tar-Paving Playgrounds, Queen's-rd, Schools	Education Committee	Thomson and Pomeroy Architects, Hill-road, Wimbleton	19
Paddington, W.—Making-up and Paving Landerdale-road	Borough Council	E. B. B. Newton, Borough Surveyor, Town Hall, Paddington, W.	21
Tatam Brow—Diverting Highway	Boatle Rural District Council	John Clark, Broughton-in-Furness	21
Paddington, W.—Making-up and Paving Biddulph-road	Borough Council	E. B. B. Newton, Borough Surveyor, Town Hall, Paddington, W.	21
Bushey, Herts—Widening Aldenham-road	Hertfordshire County Council	Urban A. Smith, County Surveyor, 41, Parliament-street, S.W.	21
Stamford—Making-up Streets on Northfields Estate	—	T. W. Hayward, A.M.I.C.E., 8, St. Mary's-street, Stamford	21
Stevenage—Leveling, &c., Basils-road and Grove-road	Urban District Council	Wm. Goslow Times, Clerk, U.D.C. Offices, Stevenage	24

FRIDAY, AUGUST 21, 1903.

PREPARATORY PROFESSIONAL WORK.

IN the earlier stages of building operations a good deal of a preparatory nature has to be considered by the architect, and it is necessary to come to this task with some knowledge of requirements. There is first what we may term the negotiable stage, in which the architect has to deal with land-owners, lessees of various kinds, various easements, by-laws, and regulations of local authorities—all very important matters. Business tact and legal qualifications are necessary in the transaction of these preliminary duties. Not many architects are capable: they have not had the training; controversial business questions are quite foreign to them. The man who can make a bargain, who is clever at compromises, is the sort of individual that will succeed. Let us see for a moment the kind of transactions to be conducted. The building owner wants to purchase land for building, and the architect has to approach the land owner or his surveyor. The terms are everything, for it would not answer to purchase land at a price which would render building on it unremunerative. The architect, representing his client, cannot advise him to purchase land without knowing the conditions; it may mean many thousands for an area of land which will be reduced considerably after the requirements by the local authority are met; for instance, they may require a roadway to be formed on one side of the site necessitating a curtailment of area, or even the widening of an existing road which the ground landlord or his surveyor has not said a word about; but such astuteness is only a matter of business. On the other hand, the architect who is acting for his clients ought to be acquainted with these restrictions; he ought to be able to ascertain how much area there is really available for building, whether there is any easement to be satisfied, what drainage is necessary, what the soil is like, and other matters as to the kind of business likely to be carried on in the neighbourhood, the eligibility of the land for residential purposes;—all these are questions which ought to be in the mind of the professional adviser before he can advise his client to embark on any building speculation. These points may make a considerable reduction in the value. Even the formation of a road will cost something, besides reducing the area for plots; and the architect ought to be able to say roughly what a road of macadam will cost of a certain width. He must be prepared with a price for a certain width, say, 30ft., which will amount to, say, 20s. to 40s. or more a lineal yard, according to its construction. An architect is sometimes employed to make a plan for new business premises, or to suggest an improvement to old premises; but it would be unsafe for him to sit down and prepare a set of drawings for building or for additions without making preliminary inquiries. The client, if a business man, may know what his liabilities as a leaseholder are—whether there are any easements of light to respect, what his neighbour's rights are; but the architect is expected at least to make himself acquainted with them. Here at least his powers as a negotiator may come into play. His plans now an addition to the old building which could considerably lessen the light that now comes over it to an opposite or adjacent building which may have rights of light, and

his only course to avoid an injunction to restrain is to consult with the owner of the dominant tenement and endeavour to make terms that will be agreeable. He ought to be prepared to tell his own client what compensation or annual payment in the form of rent should be paid to the dominant owner or is reasonable, and for this purpose negotiations must take place between the servient and dominant tenement owners as to an agreement or the payment of a sum of money. By thus acting in time an action for damages may be stayed, or a mandatory injunction refused. The Ancient Lights Bill to amend the law relating to easements of light, which was read a first time in the House of Commons last session, will, it is hoped, form the basis of all future negotiations. We have lately drawn attention to the main provisions of this Bill, one of which is that the owner of a building intended to be taken down and rebuilt has to prepare plans, sections, and elevations of such building, which must be certified by the surveyor as to their correctness. This is a duty that will devolve on the architect. The certificated plans will be evidence of the correctness of the survey, and will establish beyond doubt the exact positions of all windows and heights. The dominant owner will be given facilities to inspect such plans, so that he may be able to make any objections, or state the terms on which he will permit the servient owner to erect his building. Here the obligations of the architect of the dominant owner will be called into operation. He must be prepared to point out any objections to the design of the intended building, which will entail a careful examination of the drawings certified—a responsible duty; he must be able, if necessary, to negotiate the terms of agreement, to state any alterations necessary to be made in carrying out the building or alteration, or be able to give some opinion as to the amount of compensation to be paid to his client. Or the matter may be carried to arbitration, in which case these questions will be determined, the compensation agreed to, and the costs to be paid by either party. But before any reference is made to arbitration, the architect of the servient or dominant owner may recommend to his client a way out of the difficulty. He can suggest, for instance, alterations in the plans, light-reflecting surfaces, or other means to lessen the obstruction to light, and thus avert the resort to arbitration. These are matters that the architect on either side can do much to control. Only a qualified architect will be able to inspect the plans and sections of the servient owner, and to advise his client to accept, or otherwise, the terms offered. Every client, whether he be a servient or dominant owner, must to a large extent depend on his professional adviser's opinion before he accepts or rejects the notice. After the negotiable stage is passed, another preliminary of building is to make calculations of value and cost. In this duty the knowledge and capability of the architect are tested. Many otherwise excellent designs and schemes are rendered failures by inattention and neglect of these essentials. How many commercial undertakings come to grief because of a miscalculation of the outgoings or cost of building, of the over-estimate of the net income after deductions have been made? Occasionally the fault is that no allowance has been made for capital outlay upon essential repairs or alterations, as in the case of the valuations of shop property. The gross value has been set down without deducting for necessary alterations. It will be said these are matters outside the real architect's duty, which is simply to prepare designs for a new building, and that the client is answerable for any error in judgment as to his business. In a few instances this may be true, as when the architect receives instructions to prepare a design without limit as to cost;

but in most businesses the question of profit enters largely in the scheme. Its remunerativeness is an element the architect is required to keep in view, as in the erection of a number of houses, flats, offices, or shops, or large commercial premises. The return upon capital expended is regarded as important. The purchase value of an estate for building will depend on the number of houses or tenements which can be built on the land at a yearly ground rent. If the area has not been economically planned, the value will be less; or the designer may perchance have not taken into account the cost of formation of roads and sewers at a sufficient sum, which may make a great difference. On these matters the architect is at least expected to exercise knowledge and judgment in the preparation of his scheme. A calculation of cost must be made in some such way as this: we must first set down a sum for cost of formation and sewers, and legal expenses. Then to this sum we must add the interest on non-productive capital sunk in developing the property to take a term of years, say, at 5 per cent., deducting the contribution of purchasers towards sewers, &c. Adding the cost of land we get a total sum representing it, and the cost of developing the same, which must be deducted from the estimated income derived from the capitalised ground rents, which will give the total value of estate allowing for risk and losses. The promoters of many new building estates under-rate the cost of formation and sewers, the losses sustained by not getting in the contributions of purchasers towards the sewers, legal, and other expenses—all of which have to be set against the income derived from the ground rents. There is an eagerness to make a beginning before the estate has been developed, to get builders to erect; but the rest of the estate does not go off. Again, in the valuation of land let on lease, of which term there is some years to run, judgment is necessary in considering the prospective increase of rental at expiration of lease, or a fair valuation cannot be made; to do which, of course, it is necessary to capitalise a sum deferred so many years to add to the value upon basis of existing rental. Valuations of this sort are perhaps more the business of the surveyor than the architect; but the work of the latter is so mixed up with commercial business, and schemes of building and improvement are so entirely dependent on correct valuations, that the architect at least is expected to bring to his duties as adviser a practical knowledge of valuation of estates and buildings.

Before the design for a building can be finished preliminary calculations as to cost are essential. In large contracts the bill of quantities becomes the proper means of ascertaining the cost of a building; but this has to be prepared on the basis of a specification, which should define the materials to be employed, and the class of work to be executed. The architect must necessarily determine what these are to be. It is the custom now to leave a great deal to the surveyor—a practice which may have something to commend it in certain things; but the question of determining the kind of material and items ought to be left to the architect. In a well drawn up specification there will be no difficulty as to the materials to be used in the several trades, and the particular goods specified, fittings, and decoration ought to be clearly stated. The client may have a preference for particular fittings or wall-papers, and the architect must be prepared to advise in these matters. Consultation with the employer on these subjects at the onset will save much trouble and vexation during the progress of the work. If the building is a technical school, library, or hospital, the architect ought to consult those who have special knowledge of the require-

ments before he specifies the fittings; as a matter of fact, they are often left to a later stage, after the specification and quantities have been prepared.

At no stage of professional work is preparatory study more necessary than that of the design itself. Previous training and experience may be said to culminate at this period. The architect has to bring the full equipment of his knowledge and studies to the task; the duty of thinking over the problem, how it is to be best accomplished and the client's wishes to be carried out. How many designs are ruined by a want of preparation or study! A commission is given for the design, say, of new business premises; the architect, without any previous preparation or thought on the subject, sketches out a plan like something else of a similar kind, submits it to his client, and sets to work to prepare the drawings. There is no time to study or think over the subject, to examine other works, or to consult with experts about it—it has to be done or declined. This is the modern way of conducting business. It is working at high speed. After the building is finished, often before, defects and omissions appear, the client discovers mistakes of plan, complains of the want of convenience in some parts, of serious omissions which have to be made good; but remedies are now impossible, and any serious mistake has to be altered at great expense. The error is in not considering it worth the time to think over the subject, to consult the client, and to inspect buildings of a similar kind before committing the design to paper in a final form. A week or more, if necessary, spent in consulting others, or studying existing examples, before making a plan, is always well worth the delay. It is quite impossible to bring one's mind to a subject that is not familiar all at once. Memory is apt to be defective, and some point very important is overlooked. The problem must be turned over and over in the mind after consulting examples, before it is possible to see the question in its true light. There are some architects who depend largely on precedents; volumes of professional journals are consulted, every plan that has been published of schools, or hospitals, or libraries, and baths, is hunted up—a very good means of refreshing the memory as to points of arrangement and details, if accompanied by other more direct means of obtaining information. What are these? One is to consult the client; to try and make oneself conversant with his requirements and wishes. In the design of a house or business premises this course is the most direct. The architect is at once put on the right track; he knows what his client wishes in respect of accommodation, size of rooms, or details of the business. There is a good deal that the architect must find out by question, by familiar and confidential chats, as to mode of living, the tastes and hobbies of the client; if he keeps company, the class of trade and the like; and such intercourse is the only way the professional man can understand the real and family life of his client or his habits and business. Clients are often very reticent about their private life and habits: their instructions are given in a crude and perfunctory manner, so it is the architect, if he wants to get beneath the crust, must try to feel his way. Then there are clients who are quite unable to express their wants in an intelligible manner without being drawn out, as it were, on many points. They have no knowledge of building, they cannot "read" plans and technical drawings, and the architect's difficulties are thereby increased. There are others who take their knowledge second hand; they can only point to some example of the building they require. They have no definite ideas of their own, and therefore they must trust entirely to their architect finding out what they really want. Few in the profession have the patience to

investigate the subject in this way. The majority of architects put the rough ideas of their clients into shape without any further trouble, and the consequence is there are many alterations to make after the drawings are prepared. Of course, these relate to planning and details chiefly. Another course open to the architect to obtain information is to consult experts or experienced men in the class of building proposed. This would apply to commercial buildings, factories, workshops, and to the special requirements of schools, hospitals, libraries, and the like. In the preparation of drawings for a large shop or business premises, where steel and iron-work are largely employed, much valuable time will be saved if the architect consulted a competent structural engineer before he finished his drawings, so that the depth of floor, the size of main girders and steel beams, columns and their connections, might be ascertained. Or if there is much terracotta, the manufacturer ought to be immediately consulted, so that the large pieces and blocks required for details should be at once put in hand. For this purpose careful drawings to a large scale should be made of the elevation, and every block numbered, and every ornamental or moulded block must be drawn in detail to a scale, allowing for shrinkage in burning. From the neglect of these preliminary precautions many terracotta buildings have been spoiled by the unequal size of the pieces, and the crooked and uneven lines of the mouldings. Considerable delay in building has been caused by inattention to the early putting-in-hand of details for iron and steel work, terracotta, and special stonework. These are the architect's duties, and he should allow himself sufficient time for the preparation of these details before the contract is signed. A great deal of the architect's time is also taken up in preparing for foundations, shoring of buildings where the foundations are of a treacherous kind. In the other class of buildings we have mentioned expert advice is also essential. The practical schoolmaster or librarian is enabled to give the architect useful advice on a number of details relating to lighting, size of desks and seats, the fittings of libraries, the position of lifts, stocking books, supervision, which no treatise will give. The nursing staff or hospital specialist ought to be consulted in infirmary planning and equipment before the large-scale drawings are finished, so that any little correction may be made. In these and similar buildings of a specialised class the architect cannot afford to rely too implicitly on his own general knowledge or book studies. Technical construction of various kinds is too large a field to discuss here. Take, for instance, the different floors used in fire-resisting construction. The architect must have time to think the matter over, to determine which system he ought to adopt, and to consult his client. It may be necessary to test the strength or deflection of the system used, and these preliminary investigations take thought and time. Then the application of steel and concrete to various kinds of domes, staircases, cantilever construction for theatres, cannot be done in any perfunctory manner. Preparatory studies and inquiries must be made before details can be drawn out. These and a hundred other subjects demand preliminary investigation before the architect can safely venture to adopt or specify them, and these investigations entail inquiries, visits to manufactories and workshops, consultations with engineers and others, tests, &c. Next, of course, though less direct as a source of information, is self-study through books. A great deal has to be learned in this way, such as elementary laws of physics, the principles of measuring force or stress by graphical means, the elements of manufacture, chemical processes, and the like. Treatises and books on the planning of hospitals, workhouses,

theatres, libraries, baths, &c., teach, as a rule, what to avoid and what to aim at; but reliance cannot be placed on such means of information, as they are often based on imperfect data, and the men who write books are in the habit of giving second-hand information in such a general way that it cannot be applied to any particular case in hand.

MEASUREMENT OF OBSTRUCTED LIGHT.

OBSTRUCTION to light assumes every conceivable position or attitude in relation to windows in buildings. It is either in front of the "ancient light" or a little on one side, intercepting the sun's rays directly opposite to or obliquely to the aperture. The obstructing building or wall may be parallel to the premises obstructed, obliquely inclined, or even at right angles to it. And the light is intercepted in a variety of ways, according to the position of the sun. Writers on the subject have devised ingenious ways of ascertaining the measure of obstruction. One recent authority, Mr. Henry Bridges Molesworth, M.Inst.C.E., in his treatise, "Obstruction to Light," has dealt with the question from a strictly mathematical point of view. He points out that most authors have used diagrams to illustrate their remarks which neglect the effect of vertical perspective; in short, taking a square window of nine squares or panes, the centre one being the position of the eye, say a foot from the window, he shows that it should be represented by curved sides bulging outwards, the centre pane nearest to the eye being the largest, covering more of the field of vision, the lines of sash-bars above the eye receding to a vanishing point downwards and those below it curving upwards. Vertical lines to right and left will similarly meet in a vanishing point above and below. In fact, as he writes, what is required is the projection of the object on a surface equidistant at all points from the point of vision—a condition fulfilled by a spherical surface of which the point of vision is the centre. His method is to plot the shape of any building upon a diagram or planisphere having circles of bearing and parallels of altitude, so that the angular position of any point can be plotted easily. His theory is to assume the eye of the observer as being the centre of a hollow transparent sphere, the sun's path, and the position of the obstructions being plotted on the surface of the sphere. The theory is sound, and the method of plotting on a planisphere is more accurate certainly than the method adopted on the diagrams of many authors. But it is not our object now to explain this method in detail; we would refer the reader to the book and the graphic methods used which can be acquired by any architect or surveyor.

The many kinds of obstruction to light call for a method of finding out the actual obscuration of lights in certain cases. The question which has so often to be answered in the courts of law is "What damage the plaintiff in an action of this kind has really suffered?" and this cannot be ascertained with any degree of accuracy or satisfaction, unless the actual amount of obstruction is found. At present, the methods used for the purpose are not satisfactory. The surveyor or expert can only view the premises alleged to have suffered, and try to find out from frequent visits how much the obstructing building has affected them. But as the position of the sun is always changing, and is different at various times of the day and year, the amount of obstruction is difficult to ascertain. These conditions make it almost impossible to find out the real effect of a new building. But the actual quantity of light obstructed has not been a point with lawyers. The question

has turned more on the right of the dominant tenement owner to such an amount of light as is reasonably necessary for the comfortable use and enjoyment of the dominant tenement, or for its beneficial use as a place of business, and the proposed reform in the law, Part III., establishes this view, for it enacts, after the commencement of the Act the owner of a dominant tenement shall be "entitled to such an amount of light passing over the servient tenement as is reasonably necessary for the comfortable use and enjoyment of the dominant tenement if a dwelling-house, or for its beneficial use and occupation if used as a place of business, or for any other purpose than a dwelling-house, and he shall not be entitled to any extraordinary amount of light necessary for any particular purpose, trade, or occupation." But the section does not apply to a tenement in which a trade or occupation requiring an extraordinary amount of light has been carried on for ten years. Questions are usually settled on the legal point as to whether the plaintiff's light was "ancient" or not, without much reference to the amount obstructed. A case establishing this view has just been concluded in the Chancery Division by Mr. Justice Farwell in "Barr v. The City and Suburban Electric Carriage Co., Ltd." The action was for an injunction and damages brought by plaintiff for the obstruction of an ancient light. Barr was lessee and occupier of a block of buildings, and he carried on the business of builder and decorator. The premises consisted of a cottage, with a builder's yard and workshop behind. The plaintiff had the premises for a term of 7½ years from Midsummer, 1900, and the light obstructed was in the ground floor, and the room was used as a painter's shop, where paints were mixed and matched. It was alleged the defendants had built a wall only 12in. away from the plaintiff's premises on the south side, and this wall was only that distance away from the window in the painter's shop. The defendants' ground was higher than the plaintiffs, and the top of the defendants' wall was 2ft. 5in. above the window. For defendants it was urged that if an ancient window was established the plaintiff was only entitled to very small damages. The counsel for the plaintiff referred to defendants' second wall, which was farther off than the one within 12in. of the plaintiff's premises and parallel with it; but it was argued that if the nearest wall was not there, there would be some obstruction to the window from the further wall. From the statements made by the plaintiff's counsel it was alleged that the former lessee (Mr. Leggett) lived close by, and that when he first had the workshop this particular window did not exist in 1878. He had used this shop as a kitchen and living room, and in 1878, in order to make the room suitable, made the window to have a good light. This fact was borne out by evidence, though the defendant stated the window was made within the last two years. It was very important for the plaintiff to have a good light in the painter's shop, and evidence was brought forward to show that since the obstruction the shop could not be used for mixing and matching colours, and the plaintiff had to make other arrangements, and he used one of a suite of rooms at Chelsea, which was let for 16s. a week, for the purpose. An injunction was asked for, and a small amount of damages. He asked for a mandatory injunction with regard to the nearest wall, and submitted there was also material obstruction from the further wall. His lordship held that the plaintiff's light was "ancient," and granted the injunction with regard to the nearer wall, and awarded plaintiff also £23 13s. damages. Judgment followed with costs. It is difficult from the report to understand exactly the relative positions of the two walls, which were parallel to each other; but a wall only 12in.

away from a window and 2ft. 5in. above it would, of necessity, very materially obstruct the light, to say nothing about the more distant wall. The issue was decided upon the fact that the light was ancient. But the proposed reform in the law will not do anything to alter the issue of a case like the one mentioned: every dominant owner will be entitled as heretofore to a certain amount of light passing over the servient tenement that may be reasonably necessary for the "beneficial use and occupation of a place of business," but he will not be entitled to "any extraordinary light." How that term is to be interpreted we hardly know; but at least the obstruction caused by a wall a few inches before a window will be amenable as now to the law. Sub-clause 3, which we have quoted, refers to premises in which a trade requiring an extraordinary amount of light has been continuously carried on for ten years. A painter's shop for matching colours for wall-papers may be said to come under this category, and therefore can claim a greater degree of light. We do not discuss this moot question now, but desire to point out that the dominant owner of premises ought to be protected by the most careful means available of measuring the amount of obscuration, while the servient owner should not be compelled to pay more than a fair amount of compensation for the raising or enlargement of his building. The limitation of the amount of light received by a dominant owner is one of the main objects to be attained in an amendment of the law, as the effect of the present law has been to hamper and impede building improvements by the threat of injunction and heavy compensations. In the future the claim to an "ancient" or prescriptive light will not carry with it the heavy penalties which are often the result of infringement; but the chief question will be the amount of light actually obscured in a given trade or business. There have been decisions which have conferred on the owner of the dominant tenement a greater amount of light than he possessed previously without any reference to the particular trade or business carried on. In this manner the servient owner has been subjected to considerable interference and expense. To secure justice to the servient tenement owner, the actual measurement of the light obscured should be the basis of action.

ON BUILDING TIMBERS.—XXXIV.

OAK.

OAK—*Quercus alba*, the "white oak," so called from the colour of its bark which is whitish grey—is found growing from Southern Maine to South-west Quebec, through Central and Southern Ontario, the lower peninsula of Michigan and South Minnesota, South-east Nebraska, and Eastern Kansas, and it ranges south to North Florida and Texas. This tree grows to about 100ft. high and 6ft. in diameter, retaining all through the winter its dead and withered leaves; its wood is hard, tough, and durable, the colour being a medium brown, with light sapwood. A cube foot of heartwood weighs about 46lb. On radial sections the medullary rays may be seen arranged irregularly in broad plates, giving that handsome grain so peculiar to oak; they are also seen as well-marked lines on a transverse section, reaching in some cases from the pith to the bark of the tree across annual rings, which are seldom concentric, being more or less wavy, and differing in this respect from pines and other conifers, the rings of which are usually arranged as concentric circles of even width round the central pith. It is fortunate that a description of the various oaks found growing in America in no way enters into the scope of this work, for there are no less than two hundred varieties growing in the United States alone. Enormous logs of "American oak" are brought into this country, chiefly from Canadian ports, the States usually sending oak over in boards and planks, quartered or otherwise. When Canadian oak is opened the freshly-cut surface

shows a pinkish tint peculiar to this wood, and by which it may be distinguished from the oak of other countries. The logs, which are squared, show a good deal of rotten heart, when very large, and the shakes are sometimes so large and so numerous as to make it almost an impossibility to convert the wood without wasting one-half of it.

A common defect in American oak is a twist in the log, which makes the wood quite useless for joinery. This fault is easily seen, for the wood "checks" or cracks in drying along the lines of the medullary rays, and these cracks may be seen ranging in continuous lines along each side of a twisted log, not parallel to the edges as they should be, but running across the wood in an oblique direction. In straight-grown timber, when a log is squared the medullary rays, and consequently the minute cracks, due to seasoning or drying, will all run parallel to the edges of the log. Any joinery made from a twisted piece of timber will "wind" in the work, and as nothing will keep it straight, such wood is worse than useless. Canadian oak logs are usually sold here at from £3 10s. to £6 10s. per load; common lengths are from 35ft. to 60ft., and the squares from 13in. up to 42in. The value of the timber will depend on its size and condition, large sound logs being the most expensive. As these are 50c. ft. to a load, it will be seen that the wholesale price of American oak ranges from 1s. 5d. to 2s. 7d. A fair price for such oak in sills would therefore be (material only) 2s. per cube foot, as small scantlings only are used. Oak from the United States, 1½in. and 1¾in. thick, quartered and dry, is worth wholesale (net) from 2s. 8d. to 2s. 11d. per cube foot. The same oak cut "basted" is worth from 1s. 10d. to 2s. per foot up to 1½in. thick. Prime planks 5in. thick by 14in. up to 18in. are worth from 2s. 4d. to 2s. 5d. per cube foot. Builders generally pay 1s. per foot superficial retail for "wainscot" oak in the inch. Merchants buy American quartered oak in the inch at from 2½d. to 2¾d. per foot, and ¾in. as low as 1½d. Architects should therefore see that when they specify "wainscot oak" they do not get stuff worth only one-fifth as much. In fact, the difference in the value of American quartered-oak boards and Odessa wainscot is even more than this, for the latter are of irregular shapes, leading to much waste in some cases, whilst the former are parallel-sided, and can therefore be used without much waste. A builder who pays 1s. per foot for wainscot oak in the inch will find that it has cost him 1s. 3d. or 1s. 4d. in his joinery owing to waste. An American quartered board will cost him only the odd 3d. or 4d. under similar circumstances. The use of the term "wainscot" in describing oak will assuredly lead some day to one of those disputes lawyers are so fond of, for, What is "wainscot"? and What kind of oak is "wainscot oak"? Wainscot is the panelled woodwork which is fixed against the walls of a room, and which covers these walls from the skirting to the ceiling cornice. Along Hatton Garden, and in many other parts of London built about the same time, all the houses are wainscoted from floor to ceiling in the entrance halls and best rooms. The wood used is, however, seldom any other but pine—not yellow from Canada necessarily, but Memel or Riga yellow cut from logs, called at that time "deal." It must not be forgotten in this confusion of names that when Memel or Riga "fir" was sawn into boards it ceased to be "fir" and became "deal." Deal wainscot was always fixed with very wide panels, which were glued up in several widths. The "sweating" of the stone or brickwork behind these panels softened the glue in the joints, and the latter soon gaped open when the boards shrank. To prevent this, some joiners put charcoal behind the panels, others put wool, whilst a paint made of white-lead, Spanish brown, and linseed oil smeared all over the back of the woodwork was probably the commonest preservative used, as well as being the most efficient. In passing, it may be of interest to note that this wainscoting was measured by the superficial yard in this way—a piece of string was fixed to the top of the wainscot, and this was carried along vertically on the face of the panels and rails, and pressed into the mouldings, so as, in fact, to girth the work from top to bottom; the length of this string gave the width of the wainscot; the length was obtained by measuring with a string all round the room horizontally in a similar manner; but some joiners did not girth the mouldings for the last dimension: they measured the "circumference" of the room with a rule or rod. All

openings were deducted, and shutter fronts, doors, and other joiner's work wrought both sides were reckoned as "work and half." Cornices, dado rails, skirtings, and all moulded work planted on the wainscoting were measured extra by the foot. Chimney-pieces were also paid for extra, the framing and panelling only being priced as wainscoting unless a price per yard was given at first by what the firms of that time called the "Great," that is, inclusive of all such extra work. "Norway oak" was used for wainscoting, the workmanship costing in London 2s. per yard (in the country it cost twice as much), labour and material 6s. to 7s. per yard. Plain square deal wainscoting labour only 1s. per yard; labour and material 3s. 6d. per yard. In old price books, Norway oak, wainscot, deal wainscot, "Dissection" wainscot (probably what we call bolelection moulded work), and wainscot of Dantzic "stuff" are all mentioned in the compass of less than a quarter of a page; but there is no clue given as to what kind of wood is meant by Dantzic "stuff," for Dantzic exported pine as well as oak at that time (1726). It is obvious from all this, the term "wainscot" did not define any particular kind of oak. In fact, wainscot might be "deal" or any other wood. Another name was used merely to signify a framing and panelling which covered the wall of any room from floor to ceiling. A hundred years later (1826) "Framed Wainscoting" is defined as thin "deal" partitioning, which is to be girthed with a string in measuring, as already described. Subsequently, in the same book, "Dutch wainscot" is described as "Dutch oak," of the same species as our English or Irish timber, but of a lighter quality, and the grain of the wood "far more interesting, inasmuch as it induces manufacturers in many parts of the kingdom to connect it with articles of household furniture, which in the castellated mansion and the *cottage ornée* is extremely appropriate." Further on it is said that the Dutch oak or wainscot is made use of for various purposes, but chiefly in sashes of different descriptions, and in cabinetwork for libraries, morning-rooms, and reading-rooms, its prime cost being three times that of "fir" timber or "deal." Here "Dutch oak" and "Dutch wainscot" are synonymous terms, and as this oak was frequently used for sashes, doors, and furniture, it followed that these might be made of wall lining according to the phraseology of the day. The confusion that arises ultimately from this loose way of speaking of wood converted and unconverted may be appreciated if it is considered that had Dutch oak been used in the first instance for such work only, it would be quite as correct to say that of any room that it was wainscoted with Dutch sashes! A book on practical building written in 1850 says that "a Norway oak called Clapboard is frequently brought into London, and also one that is grown in Germany called Dutch Wainscot, being imported from Holland, to which country it is brought in floats down the Rhine." It is explained that both these woods have been extensively used here, and it is probable that the wainscot will still be employed for many purposes, for though it is softer and the grain more open than that of English oak, it is also less liable to warp. From this it appears that "Clapboard" was another name for Norway oak, and "Wainscot" came to signify oak grown in Germany. In both cases the purpose for which the woods were used came to displace the names of the woods themselves. In modern price books "wainscot" doors, sashes, floors, and staircases are described and priced, not a word being said as to what the material is, the writer apparently forgetting that wainscot is wall panelling, and nothing more. Indeed, in the index to one of these books the reader is startled by finding that wainscot is mahogany, the item being "wainscot mahogany in thicknesses." Crown oak "wainscot" logs, planks, plançons, and butts are now imported from Odessa, Libau, and Fiume, some of the qualities being described as prime, fresh, English crown wainscot logs, so that trade catalogues up to date speak of Odessa "Prime fresh oak wainscot" and "Prime fresh English crown oak wainscot," the terms varying so much that the smallest difference in the wording of a specification or invoice may lead to a lawsuit, which would settle nothing but the transference of the entire value of the wood in dispute to the pockets of the lawyers. Odessa oak wainscot logs sell for from 57s. 6d. to 60s. at *per 18ft. cube*, some logs going up to as much as 70s. The shape of these logs will be given in

another article. They have one rectangular face only—that where they are cut through the heart; two sides are tangential cuts, and the fourth side is irregular, with the bark and sapwood left on—This, however, seldom exceeds 1in. in thickness. As 18ft. cube of best Odessa crown wainscot oak costs 70s., it follows that as a little more than 180 super. feet of 1in. boards can be cut out of this standard quantity, 1in. wainscot boards would be worth not about 4½d.; these boards are seldom retailed at less than 10d., taking the boards as they rise from the log, for each log, when cut into boards, is stacked separately, leaving 5½d. per foot profit for handling and interest on capital. Odessa oak plançons are sold at from 85s. to 90s. per load, there being usually from 30ft. to 40ft. in a plançon; butts of from 12ft. to 24ft. are sold from 60s. to 70s. per load. Fiume round logs are worth from 57s. 6d. to 67s., the lengths being from 9½ft. to 35ft., and the contents varying from 50ft. to 150ft., the biggest round logs being, of course, the dearest. Good Riga oak logs are worth £5 per load in the round; they are from 14ft. to 23ft. long, and from 13in. to 18in. diameter. For some reason or other during the Gothic Revival, where church roofs, seats, or fittings were specified to be of oak, it was usually English oak; as Portland stone was more or less identified with Classic work, and Russian and German oak with the same styles, all these materials were passed over, and the woods and stones of Medieval times were as closely imitated as the forms and details of doors and windows. In fact, English architecture of the present day has so degenerated into a mere imitation of bygone styles that even a specialist in arranging the plates published weekly by the BUILDING NEWS is at a loss at first sight to say whether the buildings represented are old or modern ones. The "art" architects are the greatest offenders in this respect, though they consider themselves a consecrated class, as it were, and the salt of the earth, in whose presence it is indecent to speak of practical knowledge of any kind, and outrageous to refer to "5 per cent." Their works are always miracles of self-complacency, incompetency, and absurdity. They lecture and talk much about "art," and the man who talks the most has an immense advantage over the man who thinks the most. Many art architects write "B.A." or "M.A." after their names with a view to impress the public with the high standard of culture to which they have attained, forgetting apparently that a learned man may be utterly deficient in the saving grace of common sense, and therefore a crank who may develop into a bore when he takes to pen and ink, and is allowed unrestricted space in a public journal. However, one would be thankful if those gentlemen confined their art information to professional papers, and did not let the public have it in a more permanent form! During the Gothic Revival in this country, when our architects succeeded in attaining to the apotheosis of faddism, "Dutch wainscot" was rigidly tabooed in all "middle age" work new or restored. Latterly the milder working Austrian oak has been used for pulpits, screens, lecterns, and other fittings where there is much buttressing and crocketing and little sense. Austrian oak comes here cut like wainscot logs, and it sells at from about 2s. 4d. to 2s. 6d. per cube foot. "Figury" planks 3in. thick are worth 3s., and 1in. to 2in. about 2s. 4d. per cube foot. These may be from 11in. to 24in. wide. Though English woods have not been referred to in the preceding articles, this appears to be a fitting place for a notice of our own oak, which has almost disappeared from our buildings. At one time all the carpentry and joinery of churches and private houses were of oak—English oak only. War vessels, too, were built of it. One alone, a 70-gun ship, would require 3,000 loads, or as many good-sized trees as could be grown on fifty acres of land; but this is all changed—the only oak found on a modern building being that in the home-made stock of a bricklayer's level, or the extemporised mason's square. Should the architect specify English oak sills for the window-frames, the practical man assures him that a good (sappy) imported Baltic yellow sill will last longer, and the practical man generally comes out "on top." There are two leading varieties of oak in England, *Quercus sessiliflora* and *Quercus pedunculata*. In the first, known too as the Durmast oak, the acorns grow in clusters close to the shoot, and the leaves are set on short leaf-stalks, whilst in the other (or old English oak) the acorns grow simply on

stalks 1in. or 2in. long; and the leaves are close to the twig without the intervention of a long leafstalk. Of these two kinds of oak, the "leading line" for building is the last, for it is the strongest and most durable, as well as having the most heart-wood in proportion to sapwood. As chestnut is sometimes mistaken for oak, it may be well to note that there is much less sapwood in the former than in the latter; at the very outside, six rings of sapwood in a Spanish chestnut are nearly equivalent to 18 rings in a common oak. The timber merchant buys oak standing, and it takes a man of life-long experience to make even a tolerably safe guess as to the soundness of a growing tree. An old writer said, "There is not in Nature a thing more obnoxious to Deceit than the buying of Trees standing, upon the Reputation of their appearance to the Eye, unless the Chapman be extraordinarily judicious, so various are their hidden and concealed Infirmities till they be felled and sawn out; so as if to anything Applicable certainly there is nothing which does more perfectly comprise it than the most flourishing Outside of Trees, Fronti Nulla Fides. A Timber Tree is a Merchant-Adventurer. You shall never know what he is worth till he be Dead." Unfortunately, trees are not the only thing "obnoxious to deceit" by taking them on "the reputation of their appearance," and human beings are sometimes known to have a similar failing. The oak was a favourite tree with the Druids, and cutting mistletoe from its branches was made a religious ceremony with them. The Christians, too, have always valued it, for in the early days of the Church in this country true believers knew the cross was made of oak because it was so heavy! The Venerable Bede, who had a taste for cabinet making, asserts it was of Cypress, Cedar, Pine, and Boxwood, whilst other divines contended for Cedar, Palm, Cypress, and Olive. Not only the wood, but also the juices of the oak, were articles of trade, for "by diversity of Percolation and Straining, and by mixtures, as it were, of Divine Chymistry the juices of the oak are wonderfully specific in corroborating the Entrails, Reins, Liver, Back," and other parts of the body too numerous to mention. Modern science, which divides chemistry into organic and inorganic, wholly ignoring that which is Divine, has removed the juice of oak from the list of drugs given in the "Pharmacopoeia Londinensis," notwithstanding the sanctity of its origin! With the exception of teak, oak is the most durable wood used in building in England at present. But it must be handled by a man who knows something about it, for there is no more troublesome wood if it is not carefully selected for building work. It shrinks much, and never seasons apparently, even under cover, for oak felled 300 years and stacked in a dry place will shrink after the outer skin is removed by planing. If the tree from which any scantling has been cut grew with a twist in it, which may readily be seen in the bark or naked wood, the joinery framed up with it will wind, and if straightened will wind again, and continue to wind, for the wood is all cut across the grain. If, again, there are knots in the wood, they will, if large, sink into the face of a plank at one side, and stick up on the other side of the same surface. In fact, there is no wood so valuable for building as English oak when carefully selected, or any so utterly valueless when it is used indiscriminately as it comes from the saw. In purlins, principal rafters, and other main bearing timbers, all failures occur at knots, the pieces in course of time being broken right through, though the pieces were apparently sound, and stood up to their work for some four years after they were fixed. Knotty beams "sag" a little, the deflection increases, and finally they break across, leaving a cavity, owing to end grain shrinkage all round the knot. Oak timber defective in this way should not be used for carpentry. When knotty timber is used for joiner's work it seasons crooked, and if solid oak frames of cross-grained or knotty wood are made to take sashes of teak, mahogany, or any other straight-grained wood that will not twist in seasoning, then in course of time the frames will fail, for sills, heads, stiles, mullions, and transoms will all bend and twist so much that in some places the sashes may be drawn completely out of the frame rebates. After thirty years' use of English oak in building, the writer would not look at any knotty or twisted stuff except for firewood, and timber for joinery would only be used if cut from the trunk of a straight-grain tree from below the first branch, and this

decision has been arrived at from the use of both kinds of wood under his own personal superintendence. That oak shall be durable it is necessary that it should be felled at the right time. At Portsmouth in 1813 it was found that some war vessels built of oak were sound after ninety-five years' service, whilst in others the timbers were in a state of advanced decay after twelve years. The reasons for this were found to be solely due to the fact that in the first case the trees were felled in the winter, and seasoned for four years before being used. In the latter case the trees were felled after bark stripping—that is, in summer, and they were used in a green or unseasoned state. To hurry the seasoning of timber in the dockyards, the authorities tried charring, liming, brining, steaming, boiling, and snail-creeping; but these processes, one and all, proved utter failures. Oak timber should always be cut from a ripe or fully-grown tree—that is, one which shows a dead top. As long as the whole head looks green and vigorous, the tree is growing and the wood immature. When a dead top appears, the tree should be cut down at once, and the timber cut into fitches or planks of the size required. In the old days of wooden ships there was a great demand for compass timbers; they were also used in framing the principal rafters of barns and other farm buildings. This made the wood scarce and expensive. A genius of the time worked out a plan for making trees grow to any design required by chaining the growing stems to stakes driven into the ground. Another man, also much in advance of his time, elaborated a plan for making the trunks and branches of trees grow square instead of round, thus getting rid of waste. But neither was successful, and Providence saved the nation by putting it into men's minds to build their war-craft with steel instead of oak. We cannot help regretting that the square trunk was not a success, for then the trade would not have been plagued with Iloppus, his string measure and quarter-girth, or the 113 divisor! There are some curious statistics given about the size of oak trees. In old books on forestry there is a record of one which measured four yards in diameter, breast high, and had a trunk 40 yards long! Unfortunately for the reputation of this giant, it was discovered that a slight mistake had been made in noting the dimensions, for feet were written down as yards. One hundred feet may be taken as the outside height of a fully-grown oak tree in England. Scantlings cut from the centre of the heartwood of an oak are stronger than any cut nearer the sapwood. It is also true that scantlings cut near the sapwood are stronger than heartwood. As these statements are mutually destructive, how are they to be reconciled? The heart of an old tree always decays first at the pith, and in many such trees the heart has disappeared completely, leaving only a thin shell of heartwood to support the sapwood. Before the heartwood was thoroughly decomposed, it must have passed through every stage from soundness to rottenness. At first the heartwood was harder than any other part of the tree; then it gradually failed as decay progressed, until it was no longer the strongest part of the wood, but the weakest, the strong wood then being that immediately inside the sapwood. Heart of oak is therefore the strongest wood in a tree which has just attained its maturity after vigorous growth, as it is the weakest in an overgrown tree with rotten branches, for as these spring from the heart of the tree, so when they are neglected decay is carried into the trunk until the whole is destroyed. All pollard oaks are hollow-hearted trees;—the wood being used for ornamental purposes only, makes this failure a matter of no importance.

by improved machinery has been reduced considerably, and the most artistic hangings can now be obtained at very low prices. The illustrations include not only English, but French, American, and German designs. The author's hints on the selection of papers will be found valuable. Many mistakes are made by those who select wall-paper for rooms, in regard to the height and size, and the aspect and light, and the purpose of the room. Chapters I. and II. contain useful advice on the question of selection. A cheap paper well chosen, as the author says, is often more satisfactory than an expensive one which has been selected without due consideration of the position it is to occupy. Mr. Jennings remarks "the size, shape, and light of the room must be carefully considered in selecting a paper, the light being of the utmost importance. . . . In nine cases out of ten, perhaps, the tenant or owner of house will visit the showrooms of a wall-paper dealer and make a selection for the different rooms on the same principle as that which would be used in choosing the material for a dress. Because the design is pretty or suits the taste of the person who is making the selection, it is accepted, quite irrespective of whether it is suitable for the position it is to occupy or not." For this purpose the author recommends the plan of selecting two or three different patterns for each of the principal rooms, which are to be temporarily fastened by tacks upon the walls. A few rules are laid down. The author says the occupier's taste should be consulted in making the selection, as some people have an aversion to particular colours: on some yellowish-greens have had the effect of making their heads ache, and there are certain hues which are favoured. Certain principles must be observed in the height and length of room as compared with the breadth and aspect. A dining-room should be cheerful. If it faces the south, it would not be advisable to use the same paper as if it faced the north, because the amount of sun admitted would be very different. A very lofty room might be furnished with a very deep frieze, while a low room would require a paper having vertical stripes to give apparent height. A long and narrow room, he says, "should never be hung with a very set pattern, as the perspective will tend to increase the length. It would be better to divide the walls up into panels, although this to some extent accentuates the length." These and other considerations, like light, aspect, height, and other visual elements are most important, and are irrespective of the uses of the rooms. We may call them physical or physiological reasons, and a great deal may be said on them as based on certain laws of vision. For walls intended to have pictures, the wall-paper should be considered as a background—not a pattern or a scheme of pronounced colour; but how seldom this is observed! It is one of the common mistakes. Lately a more correct taste has been followed; perfectly plain backgrounds or "ingrains" have been used, which were used in the United States many years ago. Chosen in proper colourings, and with bold, brightly coloured friezes, the author recommends them. The bright friezes may, we think, be a mistake in some rooms. Of course the flatness and avoidance of gloss is desirable, also that the colour of the "ingrain" is a neutral, so as not to detract from the colouring of the pictures. These "ingrains" are printed on faint, simple stripes or patterns. The author, in fact, is right in thinking that for "many reasons a perfectly plain ingrain or ground paper, with a bold, well-designed frieze is the perfection of good decoration." Stencil effects, he thinks, come next to ingrains in a single colour where pictures are to be hung. Taste varies in different localities; thus in some districts in the West-end the selection of papers would be such that persons in the East-end would hardly look at. That the actual merit of a good paper design has nothing to do with the price, is a sound rule; many cheap papers have a good or better design than those costing three times as much. The author considers each room separately and the most suitable paper for it, and one or two good designs are illustrated, as the "Empire" treatment for dining-room or hall, by W. Campbell and Co. Marble paper, ruled in blocks and varnished, is no longer the taste. After plain paint, suitable designs with distinct patterns to relieve the large surfaces and "highly-coloured designs" are recommended; they give warmth and cheerfulness to the hall. Many bold and excellent

designs are illustrated—some in panels, as the "Wattrau." A bold frieze and dado of some height and varnished is used sometimes with a plain paper above. For drawing-rooms more delicacy of treatment is necessary, and the "Empire" styles of decoration are certainly suitable. The colouring should, of course, be in delicate shades, and a kind of "Wedgewood" treatment looks well. For old-fashioned heavy furniture the design should be in character, and a bolder treatment is necessary. The author says, "If the furniture is quite modern, it will not do to use a heavy floral design unless the colours are chosen to agree with the fabric used for covering the chairs, &c. A London manufacturer has for many years brought out chintz papers, which are much liked. These papers are copied also in fabrics, so that the fabric may be used on the furniture and exactly the same design on the walls." The author does not endorse this system, which certainly, as he says, may become monotonous. But no rule can be laid down—every room, its light, aspect, furniture and decorative accessories, carpets, drapery, must be carefully considered. For a dining-room comfort is desirable, and rich warm colours are recommended; if there are pictures a plain ground with a deep frieze is one of the best treatments. If there is a pattern it may be made subordinate to the pictures. "Stripes or a small dotted design" is said to look well with a bold frieze. But here, again, no general rule can be laid down, as the treatment to be adopted depends on the dimensions, the aspect and light, the kind of furniture, and if there are pictures. Oil paintings in heavy gilt frames suggest a quiet colour, but one not so delicate as if the wall were hung with small water-colour drawings or etchings. Bold patterns can be used with effect in large dining-rooms. Other suggestions are made for music-room, study, morning-room, bedrooms, boudoir, nursery, &c. The purposes of these rooms should suggest the treatment and colour: thus for bedrooms the paper ought to be quiet in pattern and colour. Anything like a design that is prominent, and appears as if it "would hit you" or too rigid in pattern must be avoided, and much the same caution is desirable in a study. Nor is a set pattern desirable in a bedroom for a sick person. Many very suitable designs are given, and several designs are shown for nursery friezes and panels of a playful and up-to-date character. Ceiling decoration or papering are also dealt with. We notice designs in stucco relief, and several examples of Lincrusta, Anaglypta, Tyne-castle canvas relief, and other wall decorations. English, American, and French wall-papers are dealt with in separate chapters; and the various kinds, such as "blanks" or "pulp," machine and hand painted, gold-bronze papers, "satins," "flocks," sanitary papers, "ingrains," silkettes, Japanese leather, Oriental tapestries, &c., are fully described. The tools employed in paper-hanging are described. Ceiling decoration, dados, fillings and friezes and drapery, pleated and lace decorations, form the subjects of other chapters of Mr. Jennings's useful and comprehensive handbook. The illustrations are very numerous, and exhibit the manufactures of well-known firms and the wall-hangings on the market.

CHURCH OF ST. JOHN BAPTIST, ADEL.

THE church at Adel is five miles from Leeds station, three miles from Arthington Junction (N.E.R.) and Kirkstall station (M.R.), and two miles from Horsforth station (N.E.R.). The key of the building near the church where the Roman remains are kept may be obtained at the rectory. Founded at some time between A.D. 1075 and A.D. 1130, and dedicated to St. John the Baptist, the church remains to this day a typical example of a small Norman church. There are indications in the shape of curious stones which have been discovered in the foundations of the former existence of a previous town church. The etymology of the name is not certain; but the earliest form of it, Adele, favours the attractive but pure conjecture that it was connected with the name of Adela, mother of King Stephen, and fourth daughter of William the Conqueror. Other forms of the name have been Adell, Addle, Athill, and Adle. That it was a place of some importance in earlier days is proved by the remains of a Roman settlement which were found here in the last century, and the still extant mound of a Roman camp, which may be seen on the left, near the road that leads north from the church, about 200 yards

WALL-PAPERS AND WALL-COVERINGS.*

A PRACTICAL handbook on the above subject for decorators, paperhangers, architects, and others, by Arthur Seymour Jennings, Editor of *The Decorator*, &c., has just been published by the Trade Papers Publishing Co., Ltd. The author, in the well-reproduced illustrations and text of this volume, gives a good general idea of the progress made in the materials and methods of wall-hangings, and the manufacture of wall-papers. The cost of production

beyond the bridge which crosses the beck. It may have owed its importance to its natural position, and its proximity to one of the main cross roads from east to west, and it would appear that the site of the church was chosen to meet the needs of a population scattered over a much wider area than that of the present parish. It is not known by whom the church was founded. The length of the nave is about 47ft. 9in. by 21ft. 7in., and that of the chancel about 25ft. 1in. by 17ft. 8½in. in width inside. The style is of the Norman period at its richest. The south porch and chancel arch are exceedingly fine specimens of the art of this period. The sculptures over the archway of the porch are each on separate stones fitted into the irregular space formed by the gable and the outer line of the arch, and not carved upon the courses of masonry—a method usually adopted in later and modern work. There is a peculiar dragon's head at the apex of the gable, with eyes of inlaid work. On the door itself, which is not old, is a fine bronze handle, perhaps contemporary with the church, and used as a sanctuary handle, smaller than, but not unlike in style to, the one on the door of Durham Cathedral. The idea of it is that of some malignant power trying to swallow the head of a man, but not succeeding. Around the church under the eaves runs a corbel table of grotesquely carved heads, 75 in number, and also nine others on the upper part of the west wall. As seems to have so often happened in the 17th century, the roof of the building fell into decay by the removal of lead or some other cause, and the only repair that was done was to place a flat lead-

covered ceiling over the nave, which was done in the year 1686. The roof of the chancel was never lowered to the same extent; but the original Norman roof had become much decayed, and for several centuries it was not known that any of it remained. In the year 1843, however, the Rev. Geo. Lewthwaite, rector, in making an investigation for repairs, found that a considerable portion of the original timbers of the Norman roof had been left and used in the construction of the existing roof, in such a manner that it was possible, with skilled advice, to see what the form and structure of the original roof had been. He called in Mr. R. D. Chantrell, architect, who not long after was commissioned to restore the roof as near to its original design as possible, and using as many of the old oak beams as were sound, and this was accordingly done. The present bell gable was designed by the same architect in the year 1839, and took the place of a wooden one that fell down in the previous year, and which, with one bell in it, had stood behind the west wall and resting on oak cross-beams of an older period than the lead roof of 1683. The roof of the nave itself, as we see it, was put up in 1879 by the late Mr. G. E. Street, R.A.; the vestry was erected and new oak seating put in at the same time. There is no doubt that originally all the windows of the church were of the same design—namely, the narrow lights which were characteristic of the Norman style. The first change from these was the insertion of the window in the south side of the chancel between the priest's door (now screwed up) and the chancel-arch. This belongs to the

14th or early 15th century. Then, at a later date, the two large windows on the south side of the nave were put in, and a similar window, but larger still, was inserted in 1681 in the east wall, and filled with glass of the period, which may be seen in the vestry, to which the window was removed by Mr. Street. The two lower windows in the west wall were inserted in 1839 by Mr. Chantrell, and took the place of two modern ones that had been made to light a gallery. When the coatings of wash were removed from the walls in 1878, portions of the Holy Scriptures were found painted on the two earliest coatings in Elizabethan characters. Over the priest's door were the words: "Keep thy foot when thou goest into the House of God," and on the north wall of the nave were painted the Beatitudes and the Ten Commandments. In the vestry may be seen a painting of the interior of the church as it was from 1681 to the restoration of 1878-1879. We have nothing but conjecture to guide us as to the purpose of the stone bracket near the pulpit: it has every appearance of being contemporary with the church itself, and was probably a stand for a crucifix or image. From the "Survey of Church Lands for 1649," in Lambeth Palace Library, it will be found the church had a narrow escape from being pulled down; but it is not known what fortunate occurrence prevented this from being carried out. The Registers of this church begin in 1600, and have been printed by the Thoresby Society, from whose secretary copies are still obtainable. It only remains to add, note as to the stone coffins and other antiquities preserved in the building near the west gate

the churchyard. The most interesting relics are three small Roman altars, on one of which are the words "Deae Brigant," which were found, were the coffins, in the fields across the beck the north of the church opposite the site of the

camp. There is also a large round stone, apparently the capital of a Roman pillar; and one very rudely carved, with a diamond pattern, and having the appearance of some decoration having been chipped from the centre. There is also a

stone with the rudely-carved words "Priminus Mutula."

These are a few of what was once a large number, most of which have unhappily been lost.

FRED WADE.

WHAT IS THE CHEAPEST PAINT?

By J. CRUICKSHANK SMITH, B.Sc., F.C.S.,
Member of the Society of Chemical Industry.
(Author of "The Manufacture of Paint.")

IN order that we may arrive at a correct appreciation of what will be in the long run the cheapest paint, four points have to be attended to:—

(1) *The Composition of the Paint.*—This strikes every person as being an important, if not the most important, point to be attended to. Unfortunately, however, there is vast difference of opinion as to what is under normal conditions the best protective coating for exterior iron or steel work. It has for long been the writer's opinion that the ultimate composition of the paint materials is not a matter with which the user need concern himself, provided he has placed himself in the hands of a scientifically-trained paint manufacturer for the supply of his protective materials. It is a little disconcerting, however, to have to place on record the fact that the number of paint manufacturers who have studied the question of corrosion, and the best means to be adopted for its prevention from a scientific and technical point of view, is almost as limited as the number of practical engineers who have an exact and technical acquaintance with the subject of paints. The outcome of this is that the paint-maker, being in many cases unable to advise in a rational manner as to the selection of materials for use under given conditions, the engineer is obliged to make the selection himself, with the result that he talks of white-lead paint or red-lead paint or zinc paint as if these terms always referred to materials of exactly the same composition, and possessing in every case identical physical and protective properties.

But let the paint manufacturer come to the engineer and say: "Here is a paint made of certain selected materials, which my experience and technical knowledge assure me are calculated to yield satisfactory results. Experiment has proved that this paint will, under ordinary conditions, protect an iron or steel surface more effectually and for a longer period than any other paint with which I am acquainted." Surely such a statement, made by a firm of repute, and whose *bona-fides* are beyond suspicion, ought to command attention. At any rate, such procedure would surely be preferable to the present chaotic state of matters, in which one manufacturer says, "Here is my genuine white-lead paint: this is the best and cheapest material you can use for protecting your bridges;" while a second manufacturer says, "Here is my genuine zinc-white paint, which every expert agrees is the only durable protection for your iron bridges;" and a third paint manufacturer says, "Here is my specially selected oxide of iron paint, which, as everyone knows, has not an equal for protecting your iron bridges:" and so on, *ad infinitum*.

The selection of the materials in the paint is undoubtedly a matter of the first consequence, but unless the engineer is prepared to make himself acquainted with the theory and practice of colour-making, paint grinding, oil boiling, and the methods adopted in blending these materials so as to produce the mixture known as paint, he is not in the best position to judge as to what are the most suitable constituents. By throwing on the manufacturer the onus of the selection of the materials used in the paint and of the thinning of the same before use, the engineer causes the latter to assume a considerable responsibility, but not a greater responsibility than the implied claim to be considered a technically qualified manufacturer warrants.

(2) *Prime Cost of the Paint.*—Too often this is regarded as the end-all and the be-all of the question. That it is not so can, I think, be very easily shown, and I have endeavoured to bring this point out in a graphic manner by means of tables. Indeed, one may go the length of saying that of all the factors that go to make up the ultimate economic value of a paint, that relating to its prime cost is the least important. This statement must not be interpreted as a contention that ridiculously fancy prices for protective paints are to be defended or are even necessary. What I want to bring out emphatically is that in nine cases out of ten far too much attention is paid to the prime cost of the materials and far too little to the other dominant factors.

(3) *Covering Capacity of the Paint.*—The term "covering capacity" is here used in the sense in which it has come to be employed as a scientific

term to express the area that can be coated with a given weight of paint. To value a paint, therefore, in terms of its economic value we must know the area covered by a given weight, or inversely, the weight of paint required per unit of area. It is well to have some definite figure that can always be employed as a unit in this connection, and a convenient unit is a hundred square feet. This figure should always be determined experimentally by the prospective buyer. There is sometimes undue exuberance in the figures quoted by paint manufacturers as representing the covering capacity of their products. The latter is a property that should be determined by the engineer himself, and the experiment should be carried out on a sufficiently large scale, and under sufficiently rigid supervision, to insure reliable results being tabulated.

We here assume that the paint is supplied by the manufacturer in the condition in which it is to be used. If this is not so the remarks made under (1) do not apply, because the indiscriminate use of oil and turpentine, especially turpentine, may practically ruin the protective qualities of a paint which but for such additions might have been eminently satisfactory. If one point more than another has to be hammered into the heads of persons concerned in the protection of iron-work, it is that the materials must not be thinned in the indiscriminate rule-of-thumb method that applies (and quite legitimately so) in ordinary house painting and decorating. From the figure representing the covering capacity per unit area can easily be deduced the cost of material per unit area for one, two, or three coats.

(4) *Durability of the Paint.*—This is a factor that is frequently lost sight of, or if not entirely neglected is considered as being of less importance than it really is. When considered only in relation to a comparatively short space of time, such as three or five years, the durability of paint is not such an important matter; but if we make the basis of our calculations 20 years, then the number of occasions during this space of time on which the paint has to be renewed exercises a very important influence on the ultimate economic value of the paint.

It may be well to point out a confusion in terms and ideas that sometimes occurs in connection with the term "durability of paint." We have to make a distinction between the durability of the surface of the paint and the preservative action of the paint on the metal beneath. The two things are by no means identical. It is a well-known fact that many paint films may present a comparatively perfect appearance from the outside while the metal beneath is corroded in a marked manner. This has been pointed out by many observers. Guber examined a large number of iron and steel bridges with the view of discovering the best means of preventing rust. In all cases rust was found below the paint (vide *Engineering*, 1895). Hence only very careful examination and scraping of the surface will determine whether after a certain lapse of time a paint is really durable in the sense of protecting the metal beneath it. It is herein, no doubt, that those who advocate oxide of iron paint as the preservative *par excellence* of ironwork have been led astray. Oxide of iron can be made into a paint which will preserve its continuity of surface and general appearance of durability from the outside for very considerable periods; but underneath the surface the corrosive action may be proceeding rapidly.

These, then, are the four essential points that have to be known and allowed for before a reliable opinion can be expressed as to what is the cheapest paint. The following table which I have compiled from data which may be regarded as fairly reliable indicates how an engineer can figure out for himself what is the comparative economic value on a 20 years' basis of various anti-corrosive paints that may be brought under his notice. The cost of labour of application is not included; obviously the charge on this account will increase rapidly the greater the number of renewals that may be necessary.

TABLE OF RELATIVE COST OF VARIOUS PAINTS, ON A TWENTY YEARS BASIS.

Covering Capacity.—Calculated from the figures given by Mr. G. H. Hurst that 10lb. of the following paints cover on metal—

White lead	648sq. ft.
Zinc white	1,138sq. ft.
Red lead	477sq. ft.
Red oxide	870sq. ft.

Durability.—The relative figures are those

currently accepted by British and American engineers.

Cost.—This is estimated at what is probably a maximum figure for the very best materials in large quantities.

The paints here mentioned are understood to be supplied ready for the brush, and to be made with special reference to the purpose for which they are to be used.

	White Lead.	Zinc White.	Red Lead.	Red Oxide.
Covering capacity in square yards per cwt.	836	1,411	504	1,039
Price per cwt. in shillings ..	32s.	36s.	32s.	29s.
Cost (in shillings) per 100 square feet	44	28	60	28
Times painted in 20 years ..	5	5	3	7
Cost in shillings per 100 square feet for 20 years ..	2.20	1.40	1.80	1.96
Relative economic value on 20 years basis, the highest value being represented by 100	64	100	77	71

Let us suppose that in the above table the figure under zinc white representing the number of renewals necessary in twenty years be written 7 instead of 5, then the cost per 100sq.ft. for twenty years will be 1.96 in place of 1.40, and the economic value of zinc paint will be brought down under that of red lead, and equal to that of red oxide; yet between the prime cost of materials in the case of red oxide and zinc white there is, on our assumed price, a difference of 8s. per cwt. This shows the fallacy of laying undue stress on the cost of the paint.

One other point suggests itself in connection with the comparison with the economic value of paints, and that is, how is it possible in practice to wait for, say, 20 years before an estimate can be formed as to the comparative merits of different projective materials? Of course an opinion has to be formed after a comparatively short interval, say three or six months; but the trained eye of a person who has intelligently studied the subject practically can in the great majority of cases detect signs of wear and tear long before the paint has actually perished. In such matters it is, after all, not the skilful engineer or the erudite chemist who makes a bee-line for truth, but the man with observant eye and logical mind. As Huxley has said, "Science is, I believe, nothing but trained and organised common sense."

ROAD MATERIAL TESTS.*

IT is only of comparatively late years that the tests of materials of construction have been carried on in a systematic way, and the history of the tests of road materials is of still more recent date. Doubtless the ancient Roman engineer satisfied himself of the suitability of his materials to the end in view, but this was probably done in a very general way, or some records would have come down to us of the methods employed. Many of the earlier writers on macadam road building noted the superiority of wear in certain varieties of rock, and reference is often made to the desirability of hard and tough rock. As early as the middle of the 19th century compression tests were made on rocks in the endeavour to determine their road building quality. The systematic testing of road materials may be said, however, to have first started in France during the seventies, where it has been steadily developed ever since. The Portuguese Government was the next to take up the subject, adopted some of the French tests, and conducted them with much precision. While the importance of the subject has been recognised in England, yet, aside from the limited investigations of a few individuals, almost nothing has been done. The same is even to a greater extent true of Germany, and the other Continental nations have left the subject practically untouched. The United States is the only other country where this work has been carried on in a systematic way. In 1893 the Massachusetts Highway Commission, in collaboration with the Lawrence Scientific School of Harvard University established a road material laboratory at the latter institution. Although the testing of paving brick was begun previous to this date, this was the first laboratory in the United States for testing road materials. The Deval abrasion test was adopted, and tests for determining the cementin power of rock dust were first developed there. Since then laboratories have been equipped with appliances for testing road materials at Maryland

* A paper read before the American Society for Testing Materials, by LOGAN WALLER PAGE and ALBERT S. CUSHMAN.

Geological Survey, Columbia University, Wisconsin Geological Survey, Cornell University, the University of California, and the Road Material Laboratory of the Department of Agriculture.

TEST OF ROAD MATERIALS IN FRANCE.

In December, 1878, the French commission on national roads decided to introduce certain mechanical tests at the laboratory of the school of roads and bridges, to be conducted in addition to and parallel with the road tests. A test, known by the name of its designer as the "Deval" test, for determining the resistance offered by road materials to abrasion, had already been found to be reliable by the street department of the City of Paris in testing the rock used in contract work, and for selecting new quarries. This test, having proved satisfactory, was accordingly adopted by

and quality. We will understand hardness, therefore, to be the resistance which a material offers to the displacement of its particles by friction. The measure of hardness will be inversely as the loss of weight arising from the scoring by an abrasive agent. Toughness is understood to mean the power possessed by a material to resist fracture under impact. As the surface of a road is continually subjected to the pounding of traffic, it can be seen that toughness is an important property from the standpoint of the road builder. With heterogeneous materials like most of the rocks used in road building, toughness depends on a number of factors. Among these may be mentioned the interlocking crystals, the nature of the crystals themselves, and, in some cases, the nature of the cementing or binding agent. The binding power, or, as it has now come to

Apparatus for Abrasion Tests.

the commission and a laboratory was founded which has steadily increased in usefulness. Before proceeding with an account of the methods of testing at present in use in this country, it will be necessary to consider the three chief qualities essential to good road materials. These are hardness, toughness, and cementing or binding power. Although these properties have been long recognised (at least, hardness and toughness) by those familiar with the subject, yet they have never been properly defined, and the terms have been very much confused. This is not at all surprising, for hardness and toughness are closely related. It would be well, therefore, to define these materials from the roadmaker's standpoint before going further.

DEFINITIONS.

There is no widely accepted measure of the property of hardness. Even in the case of metals the hardness of which has received much study, there are many tests based on different conceptions of the term; but all of these tests were designed for substances of a homogeneous nature, and are consequently not at all suited for any of the road materials. Further than this, it can be seen that in their conception of hardness some of the investigators differ much. All of these methods, as well as modifications of them, may be put under two heads: Abrasion and Penetration. Different demands of technology give rise to different definitions and methods of test, and the method used in any particular case must have a measure of the value of a new material for the purpose to which it intended. Only one test has yet been devised for determining the hardness of road materials. This is the Dorrey test of the French School of Roads and Bridges, and consists in grinding specimens with sand of a standard size

be called, the cementing value of a road material, is the property possessed by rock dust or other finely-divided material found in nature to act as a cement on the coarser fragments composing crushed stone or gravel roads. This property varies, not only with different kinds of rocks, but also with those which are practically identical in classification and chemical composition. The absence of cementing value is so pronounced with some varieties of rock that they can never be made to compact with the road roller or under traffic. As the binder surface of a macadam or gravel road is most exposed to the action of wind and rain, as well as the wear and tear of traffic, it can be seen that the presence of this property is most essential to good results. The impervious shell obtained by the use of a rock of high cementing value gives the greatest protection to the foundation of a road. It is a matter of common observation that a good surface which binds well is less dusty and less muddy, while the economy is great, as it is only the loose, unbound material which is ordinarily carried away by wind and water. In view, therefore, of the importance of this property, it has been made the subject of especial study. It was important to know the cause of the cementing value with a view to learning if anything could be done to modify the conditions of service. From an investigation carried on in the laboratory (see paper by A. S. Cashman, *Journ. Am. Chem. Soc.*, May, 1903) it appears that this property is undoubtedly related to that of plasticity in clays, and, in a few words, is due to amorphous colloidal particles which, by reason of their characteristic porous structure, are able to absorb water, thereupon assuming a plastic and coherent condition. Heating above a certain temperature destroys this structure, and the powder no longer possesses

the slightest cementing value. It is hoped that this theoretical investigation will lead to important practical developments.

THE ROAD MATERIAL LABORATORY.

The Road Material Laboratory was established in December, 1900, in the U. S. Department of Agriculture. Up to the present time about 450 samples have been reported on, representing a geographical distribution over thirty-eight States of the Union, including a number of samples from Cuba. The aim of this laboratory is to carry out standard tests on road materials, free of charge, for any citizen of the United States. In addition to this, allied problems may be presented for study, such as the suitability of clay for the manufacture of paving brick, drain tile, cement, &c., the testing of cements and concretes for road foundations, drains, gutters, and highway bridges. It is the intention of the department to aid as far as possible in the solution of all the problems of road building, but more particularly with reference to rural highways. It is not, however, the policy of the department to undertake scientific investigations or tests of materials for manufacturers or others who desire to use the information thus acquired to promote commercial ends. The tests as at present carried on are as follows:—

ABRASION TEST.

A modified form of the Deval machine, as adopted by the French School of Roads and Bridges, is used for this test. It consists essentially of four cast-iron cylinders, into which samples of the rock broken to a size between three and six centimetres are put. Five kilograms are taken for the test. The iron cylinders are fastened to a shaft, so that the axis of each cylinder is at an angle of 30° with the axis of rotation. The shaft which holds the cylinders is supported on bearings, and has at one end a pulley-wheel, by which the cylinders are revolved, and at the other end a revolution counter. In the test the cylinders revolve at the rate of 2,000 revolutions per hour for five hours. The fragments of stone are thrown from one end of the cylinder to the other twice in each revolution. They thus grind and pound against one another, and against the ends of the cylinder. At the end of 10,000 revolutions the contents of the cylinder are removed and placed on a $\frac{1}{16}$ in. mesh sieve. The sieve and the fragments of rock remaining on it is then held under running water till all adhering dust is washed off. After the fragments have been dried they are weighed, and their weight subtracted from the original five kilograms taken. The difference obtained is the weight of detritus under $\frac{1}{16}$ in. worn off in the test. In the French School a standard rock of superior wearing quality was always placed in one of the cylinders as a standard of comparison, and the proportion of the weight of the dust under 0.16 centimetre of the standard rock and the rock to be tested was assumed to give the relative resistance to abrasion of the two. It was found, however, that only the best varieties of rock gave less than 100 grains of powder under 0.16 centimetre—i.e., 20 grammes per kilogramme, or 2 per cent. of their weight. The number 20 was, therefore, adopted as a standard of excellence, and the "coefficient of wear" for any rock tested was obtained by the following formula:—Coefficient = $20 \times 20 \div W = 400 \div W$, where W is the weight in grammes per kilogramme of detritus under 0.16 centimetre. This French coefficient has been in use for many years, and is familiar to road builders; so it is still determined in this laboratory, although many rocks have been found that give a result higher than 20, which is the maximum of the French standard of excellence. Besides the French coefficient, the percentage of material under 0.16 centimetre in size is always given.

CEMENTATION TEST.

The binding or cementing power of rock dust is such an important element in road building that much time has been spent in the endeavour to devise a suitable test for determining it. Many have been tried, but as yet only an impact test, carried on in a uniform manner as described below, has given satisfactory results. One kilogramme of the rock to be tested is broken sufficiently small to pass 6 millimetres, but to be rejected by a 1-millimetre mesh screen. It is then placed in a ball-mill and allowed to grind for two hours and a half. This ball-mill contains two chilled iron balls, which weigh 25 lb. each, and is revolved at the rate of 2,000 revolutions per hour. It was found by experiment that

two hours and a half of grinding, on rock thus prepared, was sufficient to reduce it to a powder that would pass through a 0.25-millimetre mesh. The dust thus obtained is mixed with water to about the consistency of a stiff "dough," and is kept in a closed jar for twenty-four hours. About 25 grammes of this "dough" is then placed in a cylindrical metal die, 25 millimetres in diameter. A closely-fitting plug, supported by guide-ropes, is inserted over the material, which is then subjected to a pressure of 100 kilogrammes per square centimetre. It is most important in making these briquettes that they should be compressed in a uniform manner, and for this a special machine has been designed. The height of the briquette should be 25 millimetres. If the first briquette is not the right height, the requisite amount of material is added or subtracted to make the height of the next briquette the required 25 millimetres.

(To be continued.)

PIPE SUBWAYS.

THE reconstruction of many of our thoroughfares and the commencement of new streets ought to be the right opportunity for laying down subways of brick or concrete of an approved form. Expense should not be spared in discovering the most efficient system; for a portion of Broadway, New York, a plan of pipe subways was suggested, and we believe is about to be carried out. A plan was prepared for the construction of pipe galleries in connection with the Rapid Transit Railroad. Dr. James C. Bayley, the consulting engineer, has worked out a scheme. There will be a large subway under the street surface on either side of the tracks of the double-track conduit electric railway running down Broadway. These subways will be for gas and water-pipes and similar conduits. Outside these and running to the curb on either side is a double-deck wire gallery. The upper ducts of this gallery are for the signal and other low-tension wires, while the lower ones are for lighting and power conductors, the two portions of gallery being separated by a passageway running parallel with the sidewalk. There are to be no manholes in the street. Access to the subways and galleries will be through manholes in the sidewalks, or through doors from the vaults of buildings into the passageway. The subways are to be built of concrete, with steelwork in the roof, which carries the pavement of street. This description, which we gather from the *Engineering Record*, ought to lead the municipal authorities of other great towns, notably London, to consider the subject of double-deck wire galleries and pipe subways for our main streets. The cost and delay to traffic caused by the tinkering system in vogue of cutting through the street paving for rails for tramways, flooding out leaky gas and water pipes, and the continual obstruction to footway traffic caused by removing the paving stones or asphalt to get at the conduits and wires on the foot pavements, are matters which call for immediate attention.

The additions to the Wallacetown Schools, Ayr, are being warmed and ventilated by means of Shorland's patent Manchester grates, the same being supplied by Messrs. E. H. Shorland and Brother, of Manchester.

Alfred Worth, aged 50, a foreman builder, living in Corporation-street, Falsworth, died on Saturday from injuries received in the course of the heavy thunderstorm which took place on Friday afternoon. Worth and three other men who were working upon a building in Ashton-road West, Falsworth, were struck by lightning, and two of them were killed on the spot.

The Board of Trade inspection of the Devonport Corporation's extension of the Devonport and District Tramways took place on Saturday. The inspectors were Colonel von Donop, Board of Trade Permanent Ways Inspector, and Mr. J. P. Trotter, Electrical Inspector of the Board of Trade. The routes inspected were those from Stoke-terrace to Ford Hill terminus, via St. Lavan's-road, and from Stoke-terrace to Camel's Head, where the party walked across a new bridge in course of construction, and resumed the journey in another car to St. Budeaux Station, from whence the lines are being extended to Saltash Passage. The work has been carried out from plans by Mr. J. W. Endean, general manager and engineer. Messrs. Griffiths, of London, were the contractors for the permanent way, and Messrs. R. W. Blackwell and Co., London, the contractors for the overhead equipment. Mr. J. C. Stretton was the clerk of works.

OBITUARY.

WE regret to announce the death of Mr. JAMES HENRY COOK, architect, of Liverpool, who, at the early age of 41, has passed away at his residence, Mostyn-avenue, West Kirby. The deceased gentleman was in indifferent health towards the close of last year, and he spent six months in Switzerland. But about a fortnight ago alarming symptoms again developed, and he was confined to his bed until the end. Mr. J. H. Cook had had an interesting career, which has closed at a highly promising stage. He was born in Liverpool, being the son of Mr. (now Alderman) Thomas Cook, F.R.I.B.A., architect and valuer, of Liverpool and Birkenhead. Having been educated at Liverpool College, in Shaw-street, he was articled to the late Colonel Walker, architect, and on the completion of his indentures he became associated with his father, in whose business he assisted for many years, and in 1887 he was awarded the silver medal for measured drawings from the Royal Institute of British Architects. Some twelve years ago he crossed to America, and during his eight years' stay in that country he acquired much knowledge that stood him in good stead afterwards. While in America he assisted some of the most prominent architects in New York and Philadelphia. Perhaps the most important work with which he was connected was that of the memorable World's Fair at Chicago, in which he aided the late Mr. Richard Morris Hunt. In Philadelphia he was also associated in several undertakings with Mr. Frank Miles Day. About four years back he returned to England and became connected with the business carried on by his father at 12, St. George's-crescent, Liverpool, the alderman retiring from the architectural department altogether and leaving that entirely under the control of his son, while he devoted all his energies to the valuing work. During the last few years Mr. Cook obtained the third premium in the recent Dock Board contest for the new offices which are to be built upon a portion of the old George's Dock site; while again the design he prepared was highly commended in the recent Liverpool Cathedral competition. Five of the competitors in the latter contest were selected to compete and eight others were highly commended, Mr. Cook being one of the latter, and the only Liverpool man to be so honoured. We published his design in our issue of Nov. 23, 1902. Among his works at Birkenhead are additions to the Oxtown-road Congregational Church, and large contracts he carried out for Messrs. Buchanan in extensions to their mills on the Dock estate and the construction of a grain silo. He also designed a house for Mr. Thomas Gilton in Budworth-road, while his practice in Liverpool extended to Seaford, where, two years ago, a Congregational church built to his design was completed. Other recent works were warehouses for Messrs. McCombish and Co., and for Messrs. Robinson and Co., a lecture-hall at Chadwick Mount Church, and additions and alterations to the Jewish Baths, all in Liverpool; and additions to Rake-lane, Wallasey. As recently as June 1 last he formed a partnership with Mr. Otis D. Black. He leaves a widow and three children.

BURSLAM has lost the services of a prominent public man by the death of Mr. JAMES BOWDEN, which took place on Sunday night at his residence, Oak House, Endon. The deceased, who was 65 years of age, was a native of the town. He established a successful business as a builder, from which he retired about ten years ago. He, however, maintained his interest in the building trade, holding the office of secretary to the North Staffordshire Master Builders' Association up to the time of his death. He was a member of the Burslem School Board for many years, and represented the borough on the Wolstanton and Burslem Board of Guardians. He was first elected a member of the town council in 1889, and was elected to the office of Mayor in November, 1900, his mayoralty being marked by the successful termination of the movement for the establishment of a commission of the peace for the borough.

A new clock, from the designs of Lord Grimthorpe, was formally set going at Sattrington parish church, Yorks, by the Right Hon. Lady Middleton, on Tuesday last. It has been made by Messrs. Wm. Potts and Sons, clock manufacturers, Guildford-street, Leeds, and Newcastle-on-Tyne, who are also erecting a new illuminated quarter chime clock at the parish church, Stanwix, near Carlisle, from the design and plans of Lord Grimthorpe.

PROFESSIONAL AND TRADE SOCIETIES.

CAMBRIAN ARCHAEOLOGICAL ASSOCIATION.—The annual meeting of the Cambrian Archaeological Association, which was opened at Portmadoc on Monday, under the presidency of Lord Glanusk. The local secretaries are Mr. C. E. Breece and Mr. T. E. Morris, the Lord Lieutenant of Carnarvonshire (Mr. J. E. Greaves) being the chairman of the committee, and Mr. R. H. Wood, Pantglas, Trawsfynydd, the president-elect. During the week visits have been made to the old church at Penmorfa and the house associated with Owain Glyndwr at Clenny, the ancient mansion of Sir John Owen, Dolbenmaen, Llanystumdwy Church, Crickieth Castle and Church, Ystumlyn, the historic home of Howel Ap Rhys; Harlech Castle, Llanfair, Llanbedr and Llandanwg, Llanarmon, Llanybi, Llanallhaiarn, and Beddgelert churches. The readers of papers have included Principal Rhys, Professor J. E. Lloyd, Mr. W. George, the Rev. J. Jenkins, the Lord Lieutenant of Merionethshire (Mr. W. R. M. Wynne), Dr. Walter Williams, Professor Anwyl, Mr. Romilly Allen, Mr. T. E. Morris, and the Ven. Archdeacon T. Williams.

CHIPS.

A Local Government Board inquiry was held on Tuesday at Croydon into the application of the town council to borrow the sum of £2,549 for extension of water-mains in various roads, £1,850 for works of surface-water drainage in various roads, £750 for new surface-water culverts at Norbury, £1,150 for sewer in Brewery-yard adjoining the water-works, Surrey-street, and £725 for works of sewerage, Woodside.

The city council of Liverpool are about to commence the transformation of St. Mary's Cemetery, Walton-road, Kirkdale, into an ornamental ground. Monuments unclaimed will, of course, be lowered and covered with soil. This represents an improvement of much moment to a densely-crowded neighbourhood. Liverpool now possesses forty-five public parks and gardens, with an aggregate area of 834 acres.

The new market hall for Leeds, which has cost £100,000, and occupies the central site between Kirkgate, Vicar-lane, and Ludgate-hill, is approaching completion. Messrs. Leeming and Leeming, of Westminster, are the architects, and Mr. J. Reid is the clerk of works.

The Frome Urban District Council have appointed Mr. F. W. Jones, the assistant surveyor, to the post of surveyor and inspector of nuisances, in the place of Mr. Philip Elinger, who has retired after thirty years' service.

The King, on the occasion of his visit to Ireland, has appointed Mr. Henry Williams, Secretary to the Board of Public Works, Ireland, to be a member of the Fifth Class of the Royal Victorian Order.

The borough engineer for Halifax has been instructed by the town council to proceed with the extension of the tramways from Hove Edge to the George Hotel at Brighouse, at an estimated cost of £10,378.

The private Bills passed during the last session include 218 private Bills, seven Electric Lighting Order Bills (confirming Board of Trade orders in respect of 52 districts), and two Tramway Confirmation Order Bills (confirming Board of Trade orders in respect of tramways).

A memorial stained-glass window has been erected at Lichfield Cathedral in memory of the Staffordshire Yeoman and Volunteers who fell in South Africa. It was executed by Messrs. Burlison and Grylls, of London.

Extensive additions have just been completed at Blairs College, near Aberdeen, from plans by Mr. R. G. Wilson, of Aberdeen. The additions, which have cost £33,000, and are executed in granite, completes three sides of a quadrangle, with, on the north front, a lofty square tower, furnished with a central crown dome and four angle turrets. The contractor was Mr. James King, of Aberdeen.

Mr. Percy E. Nobbs, A.R.I.B.A., of Trafalgar-square, Chelsea, has been appointed to the McDonald Chair of Architecture at McGill University, Montreal, in succession to Mr. S. Henbest Capper, M.A., A.R.I.B.A., who is returning to England to act as Director of the School of Architecture at Manchester.

The fire preventive qualities of the "Fawcett" fireproof floor were again amply demonstrated in a fire which occurred at the folding-box factory of Messrs. Cropper and Co., Southwark Bridge-road, on the 12th inst. In a letter to Messrs. Mark Fawcett and Co., Mr. H. J. Cropper states that a very considerable fire raged on the ground floor, but was kept from spreading by the Fawcett floor and ceiling.

ILLUSTRATIONS.

RUTLAND COURT, KNIGHTSBRIDGE.—NATIONAL PRIZE DRAWING: CHRIST CHURCH PRIORY, HANTS.—RAILWAY HOTEL, LYME REGIS.—NEW HIGHER-GRADE ELEMENTARY SCHOOL, FINCHLEY.—DESIGNS FOR LIVERPOOL CATHEDRAL.—ST. JOHN'S CHURCH, ADEL, NEAR LEEDS.

Our Illustrations.

RUTLAND COURT, RUTLAND GATE, S.W.

There are four blocks of flats, two facing the High-road, Knightsbridge, and directly overlooking Hyde Park, and two fronting Rutland-gardens. They occupy the site of Stratheden House, and of the surrounding grounds. The house was at one time the residence of Lord Campbell, who therein wrote his "Lives of the Chancellors." The elevation has been carried out in red brick and Portland stone, the floors are fireproof, and, where the floors are 60ft. above pavement level, supplementary staircases have been provided. Each block has an electric lift, and is electrically lighted. The plans of the different floors vary considerably: the bulk of the flats are self-contained; but some are in the form of maisonnettes. The site was largely dominated by ancient lights, which have been successfully negotiated by the architect. Block 1 consists of basement, ground, first, second, third, fourth, fifth, sixth, and seventh floors. Block 2 consists of basement, ground, first, second, and third floors. Blocks 3 and 4 contain basement, ground, first, second, third, fourth, and fifth floors. The buildings have been carried out by Mr. H. Lovatt, at a cost of about £12,000, from the designs of and under the superintendence of Mr. Delissa Joseph, F.R.I.B.A.

VIEW FROM THE TRIFORIUM, CHRIST CHURCH, HANTS.

The triforium of this famous priory church is particularly interesting, and over the groining there are still remains of colour decoration in fresco of Mediaeval date. The view given by Mr. Harry Whitcomb's water-colour sketch, which we reproduce to-day, shows one bay of the Norman arcade, and looking into the church Perpendicular additions can be seen in contrast. We gave some measured drawings of Christ Church Priory by Mr. Percy Stone and Mr. Chas. J. Irwin in the Building News for Oct. 29, 1886. A view of the building from the north was published in our pages for Dec. 8, 1893, and details of the north porch will be found in the number of our journal for Dec. 16, 1887.

RAILWAY HOTEL, LYME REGIS.

This hotel is to be built with Pinhoe bricks and Ham Hill stone dressings on the ground floor, the upper story being in cement finish with a coarse surface. The roof will be covered with hand-made tiles. Mr. Arthur W. Yeoman, of Chard, is the architect.

FINCHLEY HIGHER ELEMENTARY SCHOOL.

This school is in course of erection on an admirable site on the Great North-road, between East Finchley and Whetstone, and will provide

accommodation for 330 scholars. The general scheme of plan shows ten classrooms grouped round a large central hall, with separate main and playground entrances for boys and girls at each end of the school. Two stairs, one at either end, are external to the main buildings, and give access to science and art classrooms, which are placed on the first floor. Special provision has been made for the lighting and ventilating of these classrooms. The buildings will be of brick, faced with red sand-faced bricks; the dressings will be of Monks Park stone, and the roof slated with Westmoreland green slates. The whole of the floors will be fire-resisting. The architect is Mr. W. G. Wilson, A.R.I.B.A., of Bloomsbury Mansions, Hart-street, W.C., whose design was selected by the Finchley School Board, it having been placed first by Mr. T. Colcutt, F.R.I.B.A., the assessor.

LIVERPOOL CATHEDRAL.

This double-page illustration gives a transverse section through the nave, showing lantern, transepts, and transeptal towers. It formed part of the series of drawings submitted by Messrs. Austin and Paley.

CHURCH OF ST. JOHN BAPTIST, ADEL.

(For description and further sketches, see pages 233, 234.)

CHIPS.

Colonel R. E. Slacke, an inspector of the Local Government Board, has held an inquiry at New Mills into the application of the urban district council for sanction to borrow £3,000 for the enlargement of the gasworks.

The Hon. Dudley Gordon, the second son of the Earl and Countess of Aberdeen, is fitting himself for life's battles by working as a joiner for an Aberdeen firm.

The British Ambassador in Berlin, Sir Frank Lascelles, acting on behalf of the King, unveiled, on Saturday, a memorial to the late Empress Frederick in the English Church at Homburg. It takes the form of representations of the four Evangelists in high relief above the pillars of the middle aisle, which have been executed by Mr. W. Ohly as a labour of love.

The Finance Committee of Aberdeen Town Council have found, on opening the tenders for the reconstruction of the interior of the Town House, that they considerably exceed the estimate of £10,000. Further consideration of the subject was deferred.

Major Druitt, of the Board of Trade, has inspected the further extensions of the Doncaster electric tramways, the chief being a line from Station-road to Beckett-road, Wheatley, and the other a loop line from Station-road to High-street.

Mr. George Prewett, for the last thirty years foreman of the joinery department at Southampton Docks, died on Thursday in last week, aged 71 years.

The Ipswich Corporation at their last meeting adopted the recommendation of their Electric Supply and Tramways Committee that Mr. Frank Ayton—who had been engaged since October last as resident engineer, representing Messrs. Kennedy and Jenkin—be appointed as engineer and manager of the electric light and power station and tramways undertaking, at a salary of £401 per annum, with an understanding that his salary would be increased by £40 per annum for three years.

Lord Windsor, the First Commissioner of Works, has intimated to the urban district council of Barry that it is his intention to construct a promenade, at a cost of £5,000, along the whole extent of the foreshore, from Friar's Point to Nell's Point.

The war memorial which has been erected in the Queen's Park, Crewe, to commemorate the services of the Crewe Reservists, Volunteers, and others who took part in the Boer war, was unveiled on Saturday by Lord Stalbridge (chairman of the L. and N.W. Railway). The monument faces the pavilion, and is constructed in Aberdeen granite. Above a square block, with panels in bronze, is a pyramidal finial crowned with an Ionic capital, supporting a figure of Tommy Atkins, showing rifle, bandolier, belt, pouch, and water-bottle. On the front of the monument, which was erected by Messrs. J. Whitehead and Sons, of Westminster, stands a model in bronze of Mr. F. W. Webb's latest type of 7ft. 4-wheeled-coupled compounds (four cylinders). This was designed by two Crewe workmen, Mr. J. H. Lightfoot and Mr. R. Bebbington.

Councillor W. H. Barrett, estate agent, Deansgate, Manchester, the chairman of the Salford Corporation Improvement Commission, has been placed on the Commission of the Peace for Salford.

COMPETITIONS.

GREAT HARWOOD.—In the limited competition for new central co-operative stores, shops, and public hall, to cost £11,000, in which, as we mentioned last week, the assessor has awarded the first premium to Mr. Fred. J. Parkinson, of Blackburn, the second and third premiums respectively have been awarded to Mr. Walter Stirrup and Mr. H. S. Fairhurst.

HEYWOOD FREE LIBRARY.—The conditions for the competitive plans and designs for the new library have been issued. No style of architecture is specified. This is left to the competitors; but it is suggested that it shall be of an imposing and ornate character, and that the elevation to Church-street shall be of stone. The cost of the buildings, boundary wall, gates, and other items must not exceed £4,500, the intention of the committee being that the whole scheme, complete with furniture, shelves, counters, fittings, supervision costs, and architect's fees, shall not exceed £6,000. Three premiums are nominally offered for the designs, of £30, £20, and £10 respectively; but the premium in the case of the architect selected to carry out the work will be merged in the commission. The date for sending in designs in this competition, advertised in our last two issues, has been extended by the town council from September 14 to October 1.

NEWARK-ON-TRENT.—The governors of the Magnus Grammar School, Newark, recently advertised for designs, offering premiums of £25, £15, and £10 for designs which "the governors may adjudge to be of sufficient merit, and place first, second, and third." The designs were returned with a lithographed letter to the effect that none of them were considered to be satisfactory. No premiums were awarded, and it has ended in the matter being placed in the hands of a local firm. In the advertisement, "Architects who have had experience in building technical schools" were invited to compete. Our correspondent, who has recently carried out more than one group of secondary schools, and who cannot, therefore, be regarded as inexperienced in planning, although he would not, we should think, claim an intimate knowledge of "building" such structures, adds: "I suppose the sixteen of us who competed are helpless in the matter. I imagine this was a settled affair from the first."

The memorial-stone of the public library, town and recreation-hall, and municipal buildings for Stornaway was laid last week by Major Matheson, proprietor of Lewis. Provost John Anderson explained that the buildings were undertaken for the purpose of supplying a much-felt want by giving shelter to the 2,500 Royal Naval Reserve men and fishermen who frequented the port during the herring fishing season. The total cost of all the buildings will amount to £11,000.

Mr. W. B. MacCabe, M.Inst.C.E., assistant to Mr. Spencer Harty, city engineer of Dublin, and who has been for some years past in charge of the Dublin waterworks, has been appointed chief engineer of Calcutta.

During excavations at Staylittie, Llanidloes, Mont., an ancient burial urn of the Bronze Age was found deposited in an inverted position under 7ft. of earth, surrounded by and imbedded in stiff blue clay. It contained charred human remains. The urn is of rude earthenware, slightly baked in a slow fire, and bears the rudest ornamentation, with herring-bone pattern around the rim. The diameter of the top is 15in., base 6in., depth 13in. The computed age is 2,000 years.

Important drainage investigations are being conducted as part of the irrigation studies which Mr. Elwood Mead is directing for the United States Department of Agriculture. Drainage ranks next in importance to reservoir construction in the arid and semi-arid regions of the States. Large areas have been rendered unfit for cultivation by an excess of water, which drainage will restore to productiveness. In addition, considerable water now lost by evaporation from marshes and shallow ponds can be made available for use elsewhere by constructing ditches.

The Jackson Park sewerage system, which is about to be constructed by the board of local improvements of Chicago, is planned to drain 6,200 acres between Sixty-ninth and Eighty-seventh streets, Ashland-avenue, and Lake Michigan. The system of sewers, planned by Mr. C. D. Hill, the engineer of the board, is for a large part below the lake level, and will converge to a pumping-station at Seventy-third Street and Railroad-avenue, where the sewage will be raised 6ft., and discharged into an intercepting sewer now under construction. The cost of the work is estimated at £175,000 sterling.

NEW HIGHER GRADE ELEMENTARY SCHOOL FINCHLEY.
W G WILSON ARCHT.

Architectural floor plan of the 1st floor of the 'NEW YORK' building. The plan shows a central hall (60' x 30'0") with multiple elevators and stairs. Surrounding the hall are various rooms including Class Rooms (e.g., 40' x 30'0", 30' x 30'0"), Class Rooms (e.g., 40' x 30'0", 30' x 30'0"), and a large Meeting Chamber (40' x 30'0"). The plan also includes a Gymnasium (40' x 30'0"), a Library (40' x 30'0"), and a large Hall (40' x 30'0"). The building has a main entrance on the right and a side entrance on the left. The plan is labeled 'NEW YORK' and '1ST FLOOR'.

JOHN A. WALKER

Building Intelligence.

BARTON HILL, BRISTOL.—New baths have been erected in Maze-street by the corporation. The exterior is exceptionally plain; but internally all the requirements of a first-class bathing establishment are provided. The swimming-bath tank is 75ft. by 30ft., the water being 3ft. 6in. deep at one end, and 6ft. 6in. deep at the other. The tank is lined with white glazed brickwork with white glazed scum trough. The floors of the gangways are of terrazzo, with sandstone kerb, &c. A shower-bath and foot-bath are also provided. Forty-three dressing-boxes are made to fall back against the wall. The main walls are lined with glazed bricks to a height of 7ft., and are finished above with painted Keene's cement, and roofed with steel principals, boarded, and having lantern light. A gallery for spectators is provided over dressing-boxes, giving 280 seats. In the winter-time the swimming-bath will be converted into a public hall by flooring over the plunge bath at gangway level. The slipper baths are grouped in compartments, formed by glazed brick walls 7ft. high, with open timber roofs having lantern lights. There are ten slipper baths for women, six first-class and eighteen second-class baths for men, besides two Kane's baths. The engineering work has been carried out by Messrs. Thomas Bradford and Co., of London, Manchester, and Liverpool. The building is lighted throughout by electricity. The general contractor is Mr. A. J. Beaven, of Dean-lane, Bristol. The sketch plans were designed by the city engineer, and the architect is Mr. W. S. Skinner, of Edinburgh Chambers, Baldwin-street, Bristol. The amount of contract for the building work is £13,680, and for engineering close on £3,000. Mr. James Hurn acted as clerk of the works.

COLWYN.—The Bishop of St. Asaph opened and dedicated, on Friday, the new church in Station-road, Colwyn, which is intended for the English services. The church is built of Penmaen limestone, with dressings and windows of red Hollington sandstone, with which material it is lined throughout. The style is Gothic, and the edifice comprises a chancel, nave, and side aisles. Within the nave and aisles there is accommodation for about 450 adults, and the area under the tower is intended to accommodate 60 more. The internal roof of the chancel is of oak, and that of the nave and aisles of pitchpine, and the flooring of the two latter parts of the building is of pitchpine blocks. There are six stained-glass windows. The font is of white Yorkshire stone, with green marble shafts and carved oak cover. The seating in the nave consists of oak benches, and that of the aisles of chairs. Messrs. Douglas and Minshall, of Chester, were the architects.

HASWELL.—On Saturday last the foundation-stone of the Church Hall about to be erected at Haswell was laid. The building is to consist of a hall 55ft. by 27ft., with committee and retiring rooms, also room for the caretaker in connection with the adjacent parish church. It is to be built of brick, with stone dressings, and the roof over the hall will be curved timber trusses with Venesta boarded barrel ceiling. The architectural appearance will be Domestic Gothic, harmonising with the architecture of the church. Mr. R. Wade, of High Moorsley, Hetton-le-Mole, is the contractor, who will erect the building from the design prepared by Mr. George Fox, A.R.I.B.A., 18, Mecklenburgh-square, London, W.C.

KINGSWOOD HILL, BRISTOL.—A hospital is about to be built at Kingswood Hill, to be known as the Cosham Memorial Hospital. The building, which will accommodate forty-four patients, has been designed by Mr. F. Bligh Bond, of Bristol. The building is treated in an Early Georgian style, the materials chosen being a red Pennant facing stone with Bath-stone dressings, and the roofs will be covered with Cumberland slates. The building consists of a main central block, containing the administrative department, and running east and west, and at the western extremity, lying north and south, are the wings containing the wards. The main entrance will have a pediment supported by coupled Corinthian columns. The tower, which is octagonal in form, is terminated with a cupola rising to a height of 100ft. A well-staircase, having a central space to take a full-sized bed lift, leads to the upper floor, which is devoted to nurses' bed and sitting-rooms, matron's bedroom, &c., whilst the attics

on the second-floor provide sleeping accommodation for the servants.

MUNDESEY.—The old parish-church, of which all but the western portion of the nave has long been in ruins, has, during the last few months, been undergoing restoration. Only the western half of the nave and a small quasi chancel, which stood within the walls of the old nave, have till now been available for divine service. Prior to the restoration the seating accommodation was only 200, but an additional 150 seats having been provided, the church will now seat 350. The work undertaken has included the removal of the ugly pyramidal roof, with its flat plaster ceiling, and of the temporary chancel, and the restoration of the whole of the nave and a portion of the original chancel. A new cross-braced and framed roof has been erected over the nave, the wide span of the roof rendering it necessary to provide massive tie-beams in order to prevent any outward thrust upon the old walls. The chancel, organ-chamber, and porch have had similar framed and moulded roofs, without the beams, and all have been covered with Broseley tiles upon a layer of felt. An organ-chamber has been built on the north side of the nave. The walls of the vestry at the west end of the nave have been raised several feet, and the new roof covered with Broseley tiles. The ruined portion of the chancel walls has been repaired by Mr. Clark, of Mundesley, in order to prevent further destruction, as it is hoped that the entire chancel will eventually be restored. The contractors were Messrs. Wilkins and Randall, of Norwich and Mundesley. Mr. Arthur J. Lacey, diocesan surveyor, Norwich, was the architect.

SCOTSWOOD, NEWCASTLE-ON-TYNE.—The Delaval Arms is the name of a new building which has just been erected at Scotswood by the Northumberland Public House Trust Co., Ltd., to be opened on Monday next. The lower story is of brick, and the upper is finished in rough-cast, with moulded boards to the gables. The roof is of red tiles. In the front there are stone and mullion windows, with metal casements. The main entrance is on the south side, in the centre of the building. The arch porch is in oak, and the walls in the halls are panelled, while the ceiling here, and also of the principal rooms, exposes the joists, the spaces between which are plastered. The main part of the ground floor is occupied by a dining-room, wherein sitting accommodation is provided for 150 persons. The general contractor was Mr. S. F. Davidson, of Newcastle, and Messrs. Cackett and Burns Dick, of Newcastle, were the architects.

TAMWORTH.—The foundation-stones of the new infirmary which is being erected in connection with Tamworth Workhouse were laid on Friday. The infirmary comprises three blocks. The central portion, which is to be three stories high, will be the administrative block, containing nurses' rooms, kitchens, bathrooms, surgery, and special ward. The south block will be devoted to female patients and the north to males. Each portion will be of two stories, and will contain 24 beds, the total accommodation of the infirmary being 60 beds. The building will cost £8,792.

The *Peterborough Advertiser* states that an old-established German firm of engineers are about to build engineering works near Westwood Bridge in that city, and they are in negotiation with the Ecclesiastical Commissioners, to whom the Westwood-street allotments belong, for the purchase of six acres of land. When the works are in full swing some 300 men will be employed.

An inquiry was held by Mr. Gordon Hogg, coroner, on Saturday, at Harrow, on the body of Frederick Horsman, 56, foreman to Messrs. Kingler, builders, of Oxford, who died from injuries sustained by the fall of a wall 12ft. high and several tons of earth, while he and some workmen were excavating under the wall at one of the Harrow School houses. William Collinson, a labourer, said he was working with deceased, and under his orders. Horsman, who was the only man who did not get away, for a time was working 4ft. above him, and although he was a skilled man, he had no idea that the wall would give way. Deceased had already ordered struts to be prepared, and a hole was dug to put them in. It was mentioned that two of Mr. Horsman's sons were working on the job, and saw their father dug out. Mr. Edwards, clerk of the works, produced the plan for the enlargement to Grove House, and said every precaution was taken to prevent accident. A verdict of "Accidental death" was returned.

Engineering Notes.

CONNEL AND BALLACHULISH RAILWAY.—Colonel Yorke, on behalf of the Board of Trade, made an official inspection of the new Ballachulish line on Friday. The inspection commenced with the Connel Ferry Bridge, which spans Loch Etive, and connects the new line with the Callander and Oban Railway. This bridge, which, next to the Forth Bridge, is the largest cantilever bridge in Europe, has a clear span over the sea of 500ft., and the rail level is upwards of 50ft. above high-water mark. Nine Caledonian engines coupled, and four 30-ton waggons, having an aggregate weight of about 1,000 tons, were employed as a test, and were first passed very slowly over the bridge, stopping frequently. Afterwards this heavy train was run over the bridge several times, each time at increased speed. After completing the inspection of Connel Ferry Bridge, which has been designed by Sir J. Wolfe Barry, and erected by Sir William Arrol and Co., Glasgow, Colonel Yorke, who was accompanied by the principal engineering officials of the Caledonian Railway, proceeded to Creagan Bridge, where the same tests were applied. Creagan Bridge crosses Loch Creran at Creagan Narrows, but is a less imposing structure than Connel Bridge. It is a girder bridge, with a pier in the centre, and its rail level is about 30ft. above high-water mark. The inspection of the railway, which is 26 miles in length, was continued on Saturday.

HARTLEPOOLS DOCK IMPROVEMENTS.—Mr. Newell, of Hull, the dock engineer to the N.E.R. Co., with Mr. Kirkup and Mr. Nicholson, the company's representatives in the Hartlepoons, has met a deputation representing the corporations of both boroughs, the local Chamber of Commerce, and other bodies, respecting the projected scheme of dock and harbour improvements, and submitted plans showing the modified proposals of the company. The company have abandoned the scheme for converting the present harbour and Victoria Dock into a large tidal harbour, and now propose to let the dock remain as at present, except that additional coal drops with modern appliances, and deep-water berths will be provided. The slake, behind the present fish quay, it is proposed to convert into a tidal basin, having a water area of 11 acres, with an entrance from the old harbour 80ft. in width, and to remove the fish quay to the east side of the new basin, where, it is estimated, quay space 600ft. in length would be available. The deputation strongly urged the need for a better entrance and additional quay accommodation for the timber import trade, and submitted a suggestion for the widening of the entrance to the old harbour by the removal of the projecting portion of the dock-head near the Hartlepool Custom House. Those matters the company's officials undertook to lay before the directors.

CHIPS.

At the last meeting of the town council of Brighton it was decided to apply to the Local Government Board for permission to borrow £9,792 for the enlargement of the public library.

A new Wesleyan mission chapel is being built at Dol Hey, Moses Gate, near Bolton. The building is designed to seat 450 persons, and is to cost £2,000.

At the last sitting of the Ayr Dean of Guild Court plans were passed for the erection of 46 dwelling-houses in the burgh, the estimated cost of which is £12,200.

Mr. R. H. Bicknell, M.I.C.E., of the Local Government Board, attended at Hurworth-on-Tees on Friday to inquire into an application of the Darlington Rural District Council for powers to borrow £1,150 for carrying out the necessary works in connection with the Hurworth-place sewage disposal scheme. Mr. W. Fawcett, acting clerk of the council, and Mr. Balfour, C.E., of Newcastle, gave evidence.

At Bala a pedestal has just been completed by the urban district council for a statue of the late Mr. T. E. Ellis, M.P., in the High-street. The memorial itself is being cast in bronze from a model fashioned by Mr. Goscombe John, A.R.A., and will shortly be erected and unveiled.

Among the Salford Corporation's new tram lines inspected and passed on Wednesday in last week is one leading through Eccles and Monton. When this route is opened passengers will be able to travel by it as far as Worsley, from which point there will be practically a direct line to Bolton.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the BUILDING NEWS, Clement's House, Clement's Inn Passage, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to THE STRAND NEWSPAPER COMPANY, LIMITED.

Telegraphic Address:—"Times-News, London."
Telephone No. 1633 Holborn.

NOTICE.

Bound copies of Vol. LXXXIII. are now ready, and should be ordered early (price 12s. each, by post 12s. 10d.), as only a limited number are done up. A few bound volumes of Vols. XXXIX., XL., XLVI., XLIX., L., LXI., LXII., LXIV., LXV., LXVI., LXVII., LXVIII., LXIX., LXXI., LXXII., LXXIII., LXXIV., LXXV., LXXVI., LXXVII., LXXIX., LXXX., LXXXI., and LXXXII. may still be obtained at the same price; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

Handsome Cloth Cases for Binding the BUILDING NEWS, price 2s., post free 2s. 4d., can be obtained from any Newsagent, or from the Publisher, Clement's House, Clement's Inn Passage, Strand, London, W.C.

TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 0d. (or 6dols. 30c. gold). To France or Belgium, £1 6s. 0d. (or 33fr. 30c.). To India, £1 6s. 0d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 0d.

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of eight words, the first line counting as two, the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Situations and Partnerships.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" and "Partnerships" is ONE SHILLING FOR TWENTY-FOUR WORDS, and Sixpence for every eight words after. All Situation Advertisements must be prepaid.

* * * Replies to advertisements can be received at the office, Clement's House, Clement's Inn Passage, Strand, W.C., free of charge. If to be forwarded under cover to advertiser an extra charge of Sixpence is made. (See Notice at head of "Situations.")

Rates for Trade Advertisements on front page, and special and other positions, can be obtained on application to the Publisher.

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page Advertisements and alterations in serial advertisements must reach the office by Tuesday morning to secure insertion.

RECEIVED.—W. A. and Co.—F. T.—A. M.—R. P. and Co.—S. B.—T. L. J.—G. P. K.—M. E. G.

J. AND W. STEWART.—Our abstract was taken from one of the American technical papers. The paper may possibly be printed in full in the *Proceedings* of the society referred to, the headquarters of which we think are at Chicago. Drop a postcard to the secretary.

Correspondence.

SKETCHES IN NORMANDY (?)

To the Editor of the BUILDING NEWS.

SIR,—There seem to be slight mistakes on both sides. Dol is in the Department of Ille-et-Vilaine, in Brittany, and the sketch of the porch to its cathedral's south transept (*BUILDING NEWS*, August 7, p. 171), which Mr. Andrew Oliver in to-day's issue attributes to Mr. Weatherley, as a matter of fact, is signed "Regd. T. Wheatley."

The triple hollows to each of the south, west, and east arches of the porch in question have been filled for some time by plaster models of sculptured figures (forty-two in each), and above these arches, occupying the wall space between them and the parapets above, are also models of sculpture. These occur in thirty-six

panels, each 2ft. 6in. square. They crudely represent various incidents in the Life of Our Lord. I referred to them in an article entitled "Lannon, the Land of Great Stones," in the *BUILDING NEWS* for Oct. 17 last.—I am, &c.,
Fair Park, Exeter, Aug. 14. HARRY HEMS.

TRURO CATHEDRAL.

SIR,—May an old bell-ringer and clockmaker ask where are the belfry or ringing chamber, and the bell-chamber which must be over it? And any way to the tower-top? Is it going to rival the tower of the London Law Courts, where every stone landing had to be cut through after it was built? Mr. Snell's description is silent about them all.—I am, &c.,
Aug. 15. G.

Intercommunication.

QUESTIONS.

[11993].—**Turkey Houses.**—The writer would be pleased and obliged if any reader would give him information respecting the sizes and arrangements of turkey houses for breeding purposes and for stock. They are to be erected in connection with a model farm.—TURKEY.

[11999].—**Acoustics.**—A village church is considered acoustically defective. There is no echo, but a want of resonance. It has been suggested that some system of wiring might improve matters. Would some experienced reader kindly say if this would be so, or suggest other means which would have the desired effect? The church is 48ft. wide and 60ft. long, in three spans; about 20ft. high to eaves, with open-timber high-pitched roof. The chancel is 16ft. wide by 32ft. long, and about same height as nave, and has a small chapel on one side and organ-chamber on the other.—W. FROGGATT.

REPLIES.

[11993].—**Contractor's Claim.**—I think the contractor is entitled to claim the whole of the £500. Whether he would get it depends on the evidence. It is manifest that in some cases, where plant and materials had to be fetched from a distance, the contractor would stand to lose heavily. In others, he would, perhaps, lose little. The case is one for reasonable compromise between proprietor and contractor; failing which, I should issue a writ for the whole amount and take my chance.—K.

[11997].—**Wood-Block Floor Smelling.**—I do not think there is anything for you to do except to bear the odour. The oil in the teak and acid in the oak are inherent to each. Probably disinfectant washes would be no use, although if you cared to try over a small portion to see whether it affects colour: Sulphate zinc 4oz., salt 2oz., water 1gal. It may vary small.—REGENT'S PARK.

The first portion ready for occupation of the new naval barracks at Portsmouth was taken over by the Admiralty on Friday. Within a short time the whole of the buildings will be occupied. The barracks are the largest in the world. One peculiarity of the accommodation is that the men living in them will not sleep in beds, but in hammocks, slung from the ceiling, as aboard ship.

At Tuesday's meeting of the Sedgley School Board it was decided to instruct Mr. A. Ramsell, architect to the board, to prepare plans for the enlargement of Robert-street Boys' School.

A chancel screen is about to be erected in St. Michael's Church, Middleton-Tyas, in memory of the late Lady Backhouse. The screen is of wainscot oak, and is in five bays, the centre being the doorway, with the head composed of a four-centred arch and quatrefoils and pendants. The Archdeacon of Richmond will formally dedicate the screen, which has been designed by Mr. J. P. Pritchard and Son, of Darlington, and executed by Mr. Ralph Hedley, of Newcastle, on Tuesday, Sept. 1.

At a meeting of the Bromsgrove Rural District Council on Tuesday it was decided to borrow £2,000 for carrying out the sewerage scheme adopted for Alvechurch. The amount of the loan is in addition to a sum of £519 already raised. Plans for the drainage of Clent at a cost of £600 were also adopted.

The town council of Cape Town have adopted the Berg River Hock water supply, and will apply for powers to borrow £2,000,000 for the same. The scheme was prepared by the city water engineer, Mr. R. O. Wynne Roberts, A.M.I.C.E., formerly of Oswestry, and as approved by the town council has now to be submitted to Parliament for final sanction.

The Carnegie free library at Scunthorpe, the foundation-stone of which was laid last week, is being built from plans by Mr. A. M. Cobban, of that town.

The new Roman Catholic church of St. Joseph, which has been erected at Benwell, was solemnly opened on Saturday morning, when Pontifical High Mass was sung by Dr. Preston, Bishop Auxiliary of the diocese of Hexham and Newcastle.

WATER SUPPLY AND SANITARY MATTERS.

LINLITHGOW.—The work of constructing the Linlithgow new sewerage scheme, which was commenced about twenty months ago, is now practically finished, and on Friday the works were inspected by the members of town council, the engineers, and the contractors. The scheme consists of sewers throughout the burgh, and sewage disposal works on the septic tank method, with contact beds or filters. The disposal works are situated on about four acres of ground along the west side of the Mains Burn, which has its outlet in the river Avon, about 400 yards below the works. There are two large contact-beds over which the effluent is passed by distributors for the purpose of aeration. A part of the ground for the works consists of open porous sand and gravel, and this has been converted into land filters, which take the effluent from the contact-beds, and so complete the final stage of purification of the sewage before the effluent passes into the stream adjoining the works. The entire scheme has cost about £14,000. The engineers are Messrs. Warren and Stuart, C.E., Glasgow.

CHIPS.

At Ticehurst on Wednesday week, Mr. Sweeting, one of the inspectors of the Local Government Board, held an inquiry at the Union House as to the application of the rural council for a loan of £2,000 for an infectious hospital. Mr. Caley, of Tunbridge Wells, submitted the plans, which he has prepared.

The foundation-stone of a new Wesleyan chapel at Leeming, near Bedale, was laid on Friday. The new structure is being built on the site of the old chapel, and will seat 160 persons. The cost will be £550.

A large clock has just been erected on the public hall, Bourton-on-the-Water, Glos., by Messrs. John Smith and Sons, Midland Clock Works, Derby. It has been made to the designs of Lord Grimthorpe, and has all the latest improvements.

Messrs. Knight and Parkinson, of Temple Chambers, architects and surveyors, have dissolved partnership. Mr. Samuel Knight will continue to practise at the old premises, and Mr. C. E. L. Parkinson has taken offices at 41, Bedford-row.

It has been decided to build at Felixstowe Dock a 200-quarter steep malting for Messrs. J. Gough and Sons, of Bury St. Edmunds, and also to erect eight workmen's cottages, four to be used in connection with the malting, and the other half for dock hands. The Felixstowe Dock Company have resolved to develop the north quay, so as to provide extra berthing accommodation. This work will entail a cost of upwards of £10,000, and the malting, cottages, and concomitant sidings and connections with the Great Eastern Railway system a further £20,000.

At Elgin, on Wednesday, Mr. George Cooper formally handed over for the benefit of his native town Grant Lodge and 50 acres of adjoining land which he has had laid out as a public park and recreation ground.

The Copley Society of Boston, Massachusetts, announces a Memorial Exhibition of Whistler's works, to be held in Copley Hall, Boston, next winter. The exhibition will open on Tuesday, Feb. 23, 1904.

At the tenth half-yearly meeting of the Baker-street and Waterloo Railway Company, the chairman reported that the total expenditure on the line since its commencement had amounted to £1,255,410. The western-running tunnel between Waterloo and Baker-street was through, and the eastern tunnel would be through in about seven weeks. The running tunnels had been commenced on the extension to the west of Baker-street. An agreement with the Crown had been made for a station site in the Marylebone-road, and the purchase-money had been paid. On the Southern, or Elephant and Castle, extension the lift shafts had been sunk at the Kennington-road Station; at St. George's-circus the running tunnels were being pushed forward in both directions; and at the depot site a large amount of excavation had been done.

For the post of master of works to the Glasgow Parish Council and District Lunacy Board no fewer than 130 applications have been received from architects, engineers, and others. The committee entrusted with consideration of the applications will meet shortly.

A memorial to Messrs. R. and H. Fearon, two brothers who met their death on the summit of the Matterhorn, when on a holiday tour in Switzerland last year, has just been erected in the church of All Saints', Plumpton, Sussex. The memorial takes the form of a Caen stone pulpit, with the figures of Our Lord, Moses, and Elias in large panels as a representation of the Ascension. The work has been designed and executed by Messrs. Jones and Willis, of 43, Great Russell-street.

LEGAL INTELLIGENCE.

SPALDING ARBITRATION.—At the Sessions House, Spalding, on Thursday in last week, the arbitration case of "Baker v. Neal," which had been remitted from the Lincolnshire Assizes, was heard before Mr. William Scorer, architect, of Lincoln, who was selected as the arbitrator. The claim was one by Mr. Baker, builder, of Moulton Chapel, near Spalding, against Mr. Neal, farmer, of Pinchbeck, Spalding, for work done in erecting a house for him. The case lasted five hours, numerous witnesses being called. Plaintiff claimed that he was entitled to £100, being the balance of the contract, which in the aggregate was for nearly £300. It was stated for the defendant that an expenditure of at least £100 would be required to put the house in a proper condition, owing to bad workmanship and material, and there was a counter claim for this amount. Plaintiff denied the allegations as to bad workmanship, but admitted that the bricks (supplied by defendant himself, being made on the estate) were soft and otherwise defective. After hearing the evidence, Mr. Scorer, the arbitrator, said he would communicate his decision in due course.

"UNDERTAKER" UNDER THE WORKMEN'S COMPENSATION ACT.—An important point under the Workmen's Compensation Act was decided by Judge Owen, at Newport, Mon., County-court on Friday, the point being raised as to whether the respondent in an action, Mr. R. H. Parkyn, builder and contractor, was an "undertaker" in the meaning of the Act. The application was made by the widow of Francis Higgins, a foreman carpenter, formerly in the employ of Parkyn. Evidence was given by a carriage builder named Gwatkin that he employed Parkyn to carry out some alterations to a lift at his premises, and during the execution of these by deceased he fell from the top of the lift well and was killed. Respondent contended that Gwatkin asked him to send a couple of men, and he told him that if he found the material he must also look after the men. From first to last he had nothing to do with giving orders or instructions. His honour said he had preached about insurance ever since the passing of the Act. He awarded £150 to the three children, and the balance of the claim, £131 9s., to the widow.

AGENT'S RESPONSIBILITY FOR COLLAPSE OF COTTAGES.—A charge of manslaughter against the agent of some cottage property in Henry-street, Ancoats, which recently collapsed, killing two of the inhabitants, was heard at the Manchester City Police-court on Friday. In the course of the evidence it appeared that the stability of the houses had been threatened by the unloading of a boiler in the same street, and that the managing director of a neighbouring sawmill had been so struck with their fragility that he had instructed his men to unload logs of wood "as gently as possible." It was stated, however, that the agent had attended to such complaints as had been addressed to him, and the stipendiary magistrate decided that the case was not one which ought to be submitted to a jury. It seems that three cottages collapsed, Nos. 107, 109, and 111, Henry-street. Nos. 107 and 109 were uninhabited, having been condemned about fifteen years ago; in No. 111 lived the family, two children of which were killed. Under all three cottages were cellar dwellings, likewise condemned. This wretched property belonged to a lady living at Southport, who apparently knew nothing about it except that it was managed by a trustee, an estate agent living in Manchester, who had not visited it since 1900. In No. 111 on one occasion "one of the stairs gave way and fell into the cellar"; on another occasion, last March, "the snow came in through the bad places in the ceiling." The tenants had complained of these defects, and they were remedied; but no inspection was made to see whether they were evidence of others. The condemned house next door, No. 109, had, it was stated, lost half its slates, and the rain beat through on to the party-wall, which had also been partially undermined in the cellars.

CLAIM FOR PERSONAL INJURIES.—In the City of London Court, on the 11th inst., William Tyler, scaffolder, 96, Mansell-street, Aldgate, sued Higgs and Hill, Ltd., contractors, Crown Works, South Lambeth-road, for £10, as damages for personal injuries sustained through the alleged negligence of the defendants' servants. Plaintiff was in the employment of Messrs. Lindsay, Neal, and Co., who were employed under a sub-contract by the defendants to do certain work at premises in Moorlane. While he was following his employment near a stack of scaffold boards, which it was said defendants' men had been using, some of the boards fell, striking the plaintiff on the head. As a consequence of the injuries he was out of work for three weeks, his wages at the time being 35s. a week. Dr. Ausler, who attended the plaintiff for a fortnight, gave evidence. For the defence, Carfield, the defendants' foreman, said the stack was not being used by any of the defendants' men. The plaintiffs' employer was, however, using some of the boards. Holmes, an engine-driver employed by the defendants, said that just before the accident

he observed the plaintiff getting boards from the stack. He saw the plaintiff slip and fall towards the basement. No timber fell from the stack. Other evidence was called for the defendants to show that no timber fell upon the plaintiff. It was also said, on behalf of the defendants, that the plaintiff made a claim upon his employers, and was allowed half his wages while laid up. At the end of three weeks he went to work again. The jury found a verdict for the defendants. Judgment accordingly, with costs.

LEEDS WATER ARBITRATION.—Lieut.-Colonel W. H. Wellsted, the umpire upon the claim recently heard at Westminster of Lord Masham against the Leeds Corporation, has just issued his award. The arbitration had reference to the compulsory acquisition of 395 acres of freehold land belonging to Lord Masham for the Leeds new waterworks. The claim was for £196,000, including consequential damage during the construction of the works and afterwards to Swinton Castle, and the interference with the sporting rights, shooting, and fishing on the remainder of the estate, and the timber. The valuations of the expert witnesses called by the corporation amounted to £27,000. The umpire has fixed the amount of purchase at £46,489.

RIVAL LICENSING AUTHORITIES IN LONDON.—At the Westminster Police-court on Friday the London County Council, under the London Building Act of 1894, summoned Mr. A. Carphey, engineer, of 28, Victoria-street, in respect of a composite building for showing a model railway at the rear of these premises. A temporary license for the structure was granted by the Westminster City Council, but, on behalf of the London County Council, it was submitted by Mr. Daldy, barrister, that the local body had no power to do this. Mr. Lawless, counsel for the defendant, said that Mr. Carphey was between two stools. Mr. Daldy urged that the only valid license was that of the London County Council, who held that in some respects this was a dangerous building. If the other side would come to an arrangement the County Council might overlook it. But the other side would not. For the City of Westminster Council, Mr. Rotton said that their license ran till September, and they claimed power to renew. Mr. Sheil: I will not give any immediate judgment on a matter like this. In a case of dispute between two large public bodies there certainly ought to be some better appeal than a fight in a police-court. It was agreed to adjourn the case until a date in September.

A COVENT-GARDEN ARBITRATION.—In the Westminster High Bailiff's Court, on Aug. 12, Mr. John Troutbeck and a special jury had before them the case of "Wyld and Robins v. the Great Northern, Piccadilly, and Brompton Railway Company," a claim for compensation for the compulsory acquisition of the premises, 19, James-street, Covent-garden, required for the purposes of the new Covent-garden station. Mr. Boyle, K.C., said that his clients were market gardeners, and held the premises on a lease, of which 13 years were unexpired, at a rental of £150 per annum. Covent-garden Market belonged to the Duke of Bedford, who exacted a toll varying from 1½d. to 4d. on each package sent in. This property, however, was free of toll, which often amounted to more than the rent. The takings of these premises in 1897 increased the net profits from £1,000 or so a year to an average of £3,537. Their claim was for £9,604. For the railway company, Mr. Alexander R. Stenning said the claimants would be amply compensated if they were paid £2,786, and Mr. Douglas Young assessed the value at £2,300. The jury awarded the claimants £5,435.

RAILWAY CONTRACTORS' CLAIM FOR HALF A MILLION.—Sir Benjamin Baker, sitting as arbitrator, recently commenced the hearing of a claim for £457,084 by Messrs. S. Pearson and Sons, Ltd., the contractors, against the Great Western Railway Co. for work in connection with the direct railway from South Wales to Bristol. Whilst the claimants allege that their actual out-of-pocket loss, exclusive of any added profit, amounts to £312,165, the railway company, on the other hand, say that substantially they have paid everything to which the plaintiffs are entitled. The case was adjourned until after the Long Vacation.

HETTON BUILDER HEAVILY FINED.—At the Houghton-le-Spring Petty Sessional Court last week, before Colonel Gregson, a Hetton-le-Hole builder, named Arthur Errington, was charged on four counts with having contravened the local authority's building by-laws. The case was one which has excited a good deal of interest amongst the local builders, and the court was crowded to hear the trial. Mr. W. Gough prosecuted on behalf of the Hetton-le-Hole Urban District Council. The defendant pleaded guilty to the charges. The surveyor to the council (Mr. Hardy) said the defendant was charged with first giving no intimation to the council of his intention to fill in the foundations; second, having commenced building without having first submitted plans to the council. The other two charges were similar to the first two. The surveyor, continuing, said that the defendant

had been warned, and he had also been asked to attend a meeting of the sanitary and building committee of the council, but had not done so. Mr. Gough said the case was a serious one. The defendant pleaded ignorance of the by-laws. The bench fined him 20s. and costs in each of the four cases.

CHIPS.

For some time past fears have been entertained regarding the stability of the north-east portion of the Castle at St. Andrews, N.B., known as the Kitchen Tower. Slowly the sea has eaten into the rock upon which the Castle is founded until now the walls are actually undermined. Representations were made some few months ago to H.M. Board of Works, which has now sanctioned the expenditure of between £2,000 and £3,000 in building a protection wall the whole length of the northern section of the Castle. During stormy weather the waves strike with tremendous force upon the foundation of the Castle, and the walls are to be of concrete from 10ft. to 20ft. thick. The work is to be undertaken by an Edinburgh contractor.

The Monmouthshire County Council have decided to combine the offices of county surveyor and county architect, and to pay Mr. Tanner £500 as an annual salary, instead of £350 and a gratuity of 4 per cent. for all plans and quantities.

At the town meeting of the Christchurch Town Council the town clerk reported that Mr. Rawlins, architect, of Salisbury, who acted as arbitrator between the council and the owner of Bowditch's property, which the council are acquiring for widening Bargates for tramway purposes, has sent in an award amounting to £497 4s. 4d.

Among the measures which received the Royal Assent at the prorogation were the Housing of the Working Classes (No. 2), Public Buildings Expenses, Irish Land, and Patent Office (Extension) Acts, and 37 private and provisional order Acts.

A Local Government Board inquiry was held at Bexhill on Friday by Lieut.-Colonel A. C. Smith, R.E., inspector, into the application of the town council for sanction to borrow a sum of £1,270 for sewage works and the provision of a storm-water overflow.

Mr. Justice Swinfen-Eady in the Chancery Division had before him on Friday a motion by the Ecclesiastical Commissioners as landlords of the Globe Works, Rochdale, to prevent the defendant Davenport from allowing the property to fall into a state of disrepair. At present there was nobody in possession. On his Lordship's suggestion it was agreed that the Commissioners should have leave to enter and do the necessary repairs.

A new Welsh Congregational church has been erected on the banks of the Dee at Llangollen, and the new edifice was opened on Sunday. The church has been erected, at a total cost of £3,100, from designs by Messrs. O. Morris Roberts and Sons, Portmadoc, the contractor being Mr. D. Roberts, Llangollen. The church will accommodate over 550 persons.

A Local Government Board inquiry was held at Newport, Mon., on Friday, into the application of the corporation to borrow £1,200 for new paving works in various parts of the borough. The town clerk and borough engineer explained the purposes to which it is proposed to apply the money.

A receiving order has been made in the case of John Richard Winstanley, Barrow-in-Furness, described in the order as a "quantity surveyor and fruiterer."

At an inquest held on Monday at Battersea, with reference to the death of Charles Reuben Bird, aged 60 years, a builder, lately residing at Cobbett-street, South Lambeth, who was fatally injured whilst a passenger by one of the London County Council's electric trams at Balham. A verdict of accidental death was returned. Deceased, who lived in Narbonne-avenue, got off the car when in motion opposite that thoroughfare, and sustained a fatal fracture of the skull.

The demolition of buildings abutting on the National Gallery has now been completed, and the priceless paintings contained therein isolated from any danger of fire from external sources. In the course of the work a large portion of St. George's Barracks has had to be pulled down, and the military authorities have condemned the remainder. At the rear of the National Gallery about an acre of land has been reserved in view of possible extensions of the building in the future.

The Carpenters' Company are offering two free scholarships in connection with the building and construction classes held at King's College, London. Intending candidates should forward their names by Monday, September 14, to Mr. J. Hutton Freeman, clerk, Carpenters' Hall, London Wall. The examination will be held on the following Monday.

Our Office Table.

THE British Fire Prevention Committee's operations for the summer season saw their completion last week with two tests at their testing station in Bayewater, when some armoured wood doors and an armoured concrete floor were under examination. Regarding the armoured door test, this was with tinned steel-clad armoured doors, constructed in Manchester, one being a sliding door and one a hinged door, and they were tested for a duration of one-and-a-half hours under a severe fire of gradually increasing temperature, the highest temperature being over 1,800° Fahr. The sliding door offered substantial resistance against fire. The floor test was with a composite floor of fine concrete, strengthened by steel bands, and constructed by a Swiss firm. The floor was subjected to a test of one-and-three-quarter hours under severe fire at a gradually increasing temperature to 1,800° Fahr., when the floor collapsed. Of other tests now in the report stage is a test with another pair of similar armoured doors. Further, with a floor of Australian Karri wood and with a thin partition, by a Dutch firm. All the reports will be issued in due course. In framing the reports an innovation will no doubt be found, inasmuch as the metric system will henceforward be applied in the committee's reports, as well as our own system of weights and measures, this being in accordance with a resolution arrived at at the International Fire Prevention Congress, requesting all reports of different countries to adopt the metric system as well as their local system of measurement and weight.

A NEW code of regulations dealing with the demolition of buildings within the City, and seeking to afford better protection to the public from dust, has been issued by the Streets Committee of the City Corporation, whose members have been assisted with suggestions by the Royal Institute of British Architects, the Surveyors' Institution, and the Institute of Builders. The new by-laws provide that in the future, before any demolition takes place, all windows and other openings in the external walls shall be close-boarded. Canvas or boarded screens, mats, and other suitable appliances must be used whenever required, and so placed as to reduce the nuisance arising from the escape of dust. Rubbish, lime, or mortar must not be shot or allowed to fall from floor to floor into any basement within 20ft. of the public way between 10 a.m. and 6 p.m., except on Saturdays, when it will be permitted after 3 p.m. Further, no materials arising from the demolition of buildings shall be basketed, wheeled, or loaded into carts, or carted away between 10 a.m. and 6 p.m. except on Saturdays, unless proper provision has been made for the protection of the public from dust. Any person who commits an offence against the new by-laws will be liable to a fine of 45 for each breach.

Two short extensions of the tramway routes in South London which have been converted for the London County Council from horse to electric traction were opened at the end of last week. These extensions cross one another to the south of St. Mark's Church, Kennington. The one is a continuation of the tramway system from the north end of Camberwell New-road by way of Harleyford-road and the Oval to Vauxhall Station; this section, formerly single, is now a double line throughout, and part of Harleyford-road has been widened for this purpose on the east side. The second route, a very short one, extends from Kennington Gate along the northern portion of the Brixton-road (which has been widened) to the Fire Brigade Station in that thoroughfare. By the electrification of this short link, which has been in progress for some weeks, cars can be drawn by electric power from Westminster, Waterloo, and Blackfriars bridges, to the fire brigade station, and thence through Brixton and Streatham by cable propulsion, as hitherto. The works on these sections have been carried out by Messrs. J. G. White and Co., of Clapham. The electrification of the two routes from the Elephant and Castle to Greenwich via New and Old Kent-roads, and via Walworth, Camberwell, and Peckham thoroughfares converging at New Cross Gate to the eastern terminus, is making good progress.

The Calendar for the ensuing session of the Glasgow and West of Scotland Technical College has just been published as a substantial cloth-bound octavo volume of 326 pages. The day classes open on Monday, September 21st prox.,

and will close on March 31, 1904. The department of Architecture and Building Construction is, as in former years, under the guidance of Professor Charles Gourlay, B.Sc., A.R.I.B.A., who is assisted by an able staff, including Messrs. J. S. Boyd, Jas. Brown, Charles Forsyth, Alex. T. Heathcote, W. P. McKechnie, and Archibald Scott. We note in the syllabi of this department that Course I. in "Building Construction" has been entirely rearranged, and specially suited for Scottish students; while Course III., "Design of Building Structures," has been remodelled.

MESSRS. EASTON AND CO., LTD., send us an excellent reading case, with an A B C railway guide—we wish it had been "Bradshaw,"—inclosed, which they are circulating among prospective clients in the lift industry as a method of keeping their name before their clients. It is their intention to provide their customers, should they express a desire for it, with the A B C Railway Guide free of charge at intervals in the future. It is of interest to learn that among recent contracts received by this company are lifts for the L.C.C., Admiralty, War Office, H.M. Office of Works, the Midland Grand Hotel at Manchester (19 lifts), and for many members of the aristocracy, and many leading architects all over the British Isles, and that the company's electric lifts especially are being shipped to South Africa, Australia, China, and other British Colonies at the moment. The company's output of lifts has been trebled during the past year.

THE Russian Consul-General in London sends the general rules and classification of the first International Exhibition of Industrial Art for Metal or Stone Products, which is to be held at St. Petersburg in November next. The exhibition will be held in the buildings of the Passage, 48, Nevsky Prospect, and remain open for at least two months, between November 15 (28), 1903, and February 10 (24), 1904. The exhibition has in the first place the object of making the public acquainted with the progress attained by Russian and foreign industry in the artistic finish of metal and stone products. To the exhibition will be admitted articles of Russian and foreign make, produced of metals (precious and common metals and alloys), or trimmed with such metals and alloys, such as articles of stones (precious stones, stones of a certain value, and artificial stones). All these articles must absolutely distinguish themselves through their artistic execution or some originality in their shape, design, or way of production. Cumbrous and very heavy objects are not admitted. Special freights and exemption from import duties on certain conditions have been arranged for all exhibits by permission of the Minister of Finance, and awards for the best exhibits will be distributed according to the decision of the jury. Further particulars can be obtained from the Russian Consulate-General, 17, Great Winchester-street, E.C.

The Corporation of Oldham have obtained the sanction of the Local Government Board to borrow £62,000 for tramway plant and street widening, and £17,000 for electrical equipment of the lines.

Mr. Charles Sanford Terry, M.A., lecturer in history for the past five years in Aberdeen University, and who previously occupied a similar post at the Newcastle College of Science, has been appointed to the newly-instituted Burnett-Fletcher Chair of History and Archaeology.

On Friday last the new church room in connection with St. George's Church, Llandudno, erected in memory of Dr. Kenwick Bold Williams, J.P., Morannedd, was dedicated by the Ven. Archdeacon Morgan, M.A. Mr. Edwin Turner was the architect, and Mr. Thomas Jones the builder. Oak stalls and a clergy desk, designed by Mr. Turner, and executed by Mr. Jones, have also been placed in the chancel of St. George's Church.

The new pulpit which is being made as a Victorian memorial for Whippingham Church is nearly completed. It is in oak, carved in a simple design prepared by Mr. Nutt, the architect to the Dean and Chapter of St. George's Chapel, Windsor, and is being produced by English workpeople. The old pulpit has been removed, and for the time being sermons are delivered from a lectern.

The total cost of the new buildings required in connection with the extension of Glasgow University will be between £90,000 and £100,000. Estimates to the extent of about £70,000 have already been accepted for the various works connected with the scheme, exclusive of painting, heating, electric lighting, and fittings generally, which are expected to entail a further expenditure of about £30,000.

Trade News.

WAGES MOVEMENTS.

THE LABOUR MARKET IN JULY.—The monthly memorandum prepared by the Labour Department is based on 3,383 returns—viz., 2,087 from employers or their associations, 1,231 from trade unions, and 65 from other sources. Employment continued, it is reported, to show a falling off in July, as compared both with June, 1903, and with July, 1902. In the 226 trade unions, with an aggregate membership of 555,743, making returns, 27,391 (or 4.9 per cent.) were reported as unemployed at the end of July, as compared with 4.5 per cent. in June, and 4.0 per cent. in the 222 trade unions, with a membership of 555,169, from which returns were received for July, 1902. The mean percentage of unemployed returned at the end of July during the past decade was 4.0. In the building trades employment continues moderate, and shows little change as compared with either a month or a year ago. The percentage of unemployed trade union members among carpenters and joiners was 3.3 at the end of July, compared with 3.4 at the end of June, and 2.9 a year ago. The percentage for plumbers was 6.7 at the end of July, as compared with 7.6 in June, and 6.5 in July, 1902. The total number of workpeople involved in disputes which began or were in progress during July, 1903, was 10,100, compared with 12,314 in June, 1903, and 116,814 in July, 1902. Fourteen disputes began in July, involving 5,132 workpeople, compared with 17 in June, 1903, and 25 in July, 1902. Definite results were reported during the month in the case of 12 disputes, new and old, affecting 5,393 workpeople. Of these disputes, four, involving 2,426 persons, were decided in favour of the workpeople; five, involving 234 persons, in favour of the employers; and three, involving 2,733 persons, were compromised. The changes in rates of wages reported during July affected about 59,100 workpeople, of whom 3,900 received advances and 55,500 sustained decreases. The net effect of all the changes was a decrease of about £1,900 per week. Among the changes reported was an increase affecting 1,500 masons in Edinburgh.

ABERDEENSHIRE MASONS.—At a special meeting on Friday night of the Building Branch of the Aberdeen United Operative Masons and Granite Cutters' association, a reply was read from the employers' Association regarding the request by the branch that the wages of wallers and blockers should be increased ½d. per hour. In this communication the employers declined to make any change, as they did not think the state of trade warranted them in doing so. The meeting decided by a large majority to put the matter to arbitration, in terms of the agreement regulating all disputed points in the trade.

ARDROSSAN MASONS.—The strike of masons in Ardrossan district is now ended, and the men have gone back to work. The agreement is to the effect that wages will be paid at the rate of 9½d. per hour till September 1. From September 1 onwards the rate of wages will be 9d. per hour.

CHIPS.

The sales at the Mart last week, as registered at the Estate Exchange, amounted to £12,945, as against £19,805 for the corresponding week of last year.

Special authorisation has been issued to the Deutsche Strassenbahn-Gesellschaft, of Dresden, to equip a short section of their existing tramway lines on the Kingsland surface contact, preliminary if satisfactory to the extension over the Dresden tramway system generally. This system of tramway traction has been developed by Mr. F. S. Bolton.

The workhouse at West Mallig, Kent, is being enlarged at a cost of £10,000, from plans by Mr. W. L. Grant, architect.

Dr. Whiteside, Roman Catholic Bishop of Liverpool, laid on Saturday the memorial-stone of a new industrial school for girls, which is being erected at a cost of £10,000 at Blackbrook, near St. Helens. It will accommodate between 120 and 150 girls.

Mr. W. Harston, who recently tendered his resignation as surveyor to the urban district council of Dartford, has been presented with a handsome silver salver in recognition of his fifteen years' service under the authority. The gift was accompanied by an address, and the subscribers consisted of the past and present members and officials of the council.

The town council of Ludlow have decided to provide an electric light installation and to erect a refuse destructor at a total estimated outlay of £8,250.

The lofty tower of St. Mary's Church, Happing-burgh, is about to be repaired from plans by Mr. A. J. Lacey, diocesan architect, Norwich, ominous cracks having revealed themselves in the western wall surface.

THE BUILDING NEWS AND ENGINEERING JOURNAL.

VOL. LXXXV.—No. 253S.

FRIDAY, AUGUST 28, 1903.

PROFESSIONAL QUESTIONS.

AT this time of the year, when many members of the profession are enjoying their holidays and recruiting their health and energies for another session, it is useful to "take stock," and review the position. One or two questions of pressing moment still occupy the attention of the profession. The educational problem is still with us, and seems as far off as ever from a satisfactory solution. The same problem concerns the engineering as well as the architectural profession. In both it is considered desirable that professional training should include a fair mixture of general education and workshop experience. The college system, in this country at least, has not been attended with the best results, one of the reasons being that our colleges have not the facilities for professional training which they possess in the United States, as the late Mr. Arthur Cates conclusively showed. On the other hand, the workshop system by itself is also not the best fitted to train engineers or architects in several branches. The two must be combined in some degree, and the question remains, Which is the most desirable mode? In an address delivered lately by Professor John Dewar Cormack, A.M.Inst.C.E., before the Engineering Conference held by the Institution of Civil Engineers, several combined systems were described in their relation to engineering. A youth entering a college after three years in the factory and office is said to be a good type of student. "He has gone through the shops at the receptive and initiative age." "He has ascertained whether engineering is to his liking, and comes to college with a knowledge of processes, materials, and machinery." But this class of student is often deficient in theoretical knowledge: he has probably forgotten his school studies, and his scientific knowledge of principles is too imperfect to be of any use in application. A youth who learns his business by workshop methods is often the least disposed to begin a college course. The other case given is one who has been to college, and is entering an office or workshop. The youth makes progress, though in the technical part of his business he is often at a loss to understand processes and machinery, and is unable to associate his theoretical studies with practical examples. The "college before works" student is certainly likely to acquire his workshop training more rapidly than the youth who has no preparatory knowledge. On the other hand, the college-trained youth does not take favourably to the shop drudgery. There are advantages and disadvantages in both the "separate" and "combined" systems; but the balance of opinion is in favour of compromises—one of these is where the pupil for a few months of each year spends his time in the office or factory or workshop, and the rest of the time in the college or classroom. The architect's training has not yet been definitely settled. There are those who prefer to keep the pupil at school or in classes, both before and after he is articulated; others who think that after his schooling is over he should confine his attention entirely to practical work. The workshop and college are antagonistic to each other. Youths take kindly to one or the other, as their inclinations prompt them. A few boys are studious; the majority are disinclined to study and book-learning, and the profession have to find out how these two opposite tendencies in the youthful mind can be made the best of or reconciled. A combined system

seems the only satisfactory solution. In the architectural profession we have the youth giving himself up to drawing and art and neglecting the practical side of his profession to provide for on one side, and on the other the youth that is practical and fond of manual work, but who cares little for art. Each of these classes has to be taken in account in the educational *régime*, though it appears we have only considered the youth who cares for study and books, or mere drawing, and have neglected a particular class that is the most numerous. These are points that deserve attention in the immediate future. During the vacation an opportune time will be given to consider the various questions which affect the profession.

We have lately referred to the Registration movement, which has made steady progress and enlisted the sympathies of not a few in the profession who at one time were its bitterest opponents. Architectural Competition Reform is another subject which may well occupy the spare moments of holiday-seekers who are obtaining rest, some of whom are interested in impending competitions. Many useful suggestions have been made since the Competition Reform Society was established. The results of recent competitions have left grievances in the minds of many. The principal objection to many of the decisions is that only one assessor of known tastes and prejudices has been appointed to judge the merits of the plans. The one-assessor system has not worked well in many cases, and a suggestion that there should be a jury of three assessors, two of whom should be architects and the other a specialist, has been favourably received. One suggestion is, that the conditions of competition should be drawn up by, or be approved by, the assessor, who should make his acceptance of the assessorship conditional upon his approving them, and that the conditions should form an agreement between the promoters, assessors, and competitors. The question whether the design placed first should be in strict accord with the instructions, or whether it should be in the opinion of the jury the best, is one that ought to be settled. The two things, compliance with conditions and skilful design, are not identical. If the conditions and instructions are made imperative, the awards should be based on them, though the promoters may reserve the right to carry out any other design they thought best, compensating fairly the author placed first. In the interest of the public at least this arrangement is justifiable. On the contrary, we are inclined to think imperfect and defective instructions drawn up by incompetent committees ought not to be made binding upon the author who has produced the most skilful design for the purpose. His design, at least, should receive a prize. In one or two instances of late the assessor has been bold enough to act upon his convictions in placing first a design which, though not in strict accordance with the letter of the instructions, is decidedly clever. Of course, such awards will always give offence to those who adhere closely to the instructions. The question is a moot one.

Among questions likely to form subjects of controversy in the next architectural session the Bill prepared last session to amend the Acts relating to buildings in London, and to confer powers on the London County Council, will receive early attention. The importance of the measure no one will question, in view of the serious losses of life owing to insufficient means of escape in case of fire from buildings. The vested interests of property owners in London have been strong enough to throw out the Bill; but there must be a renewed attempt to deal with the subject, and to amend the very inadequate provisions against fire in the London Building Act, 1894, especially in relation to existing high build-

ings. No doubt, many new suggestions will be made. The attitude of the profession towards the Bill is not yet known; but we cannot think it will be hostile to the main provisions. In fact, the profession will be gainers rather than losers if the owners of high buildings are called upon to submit plans to the Council for approval. A considerable reconstruction of business premises, warehouses, and dwellings must be the result. The construction of internal staircases and the approaches to buildings with projecting shops will involve considerable alterations and the amendment of section 74 of the present Act. The reform contemplated will also set the inventive faculties of many into operation. Means of escape have to be approved. In many buildings they must be on the outside in the form of balconies and flights of iron steps. The employment of concrete encased steel will be recognised, and those fire-resisting systems of floor-construction which are the most economical and effective will receive consideration. Of late the attention of the profession has been drawn to several instances of ferro-concrete construction, and the value of the Hennebique system, as shown in the tests of floors at Tottenham, we lately recorded. We expect to hear also many opinions expressed on the Ancient Lights Bill, lately discussed in these pages, now before Parliament. During the vacation the subject will not be absent from the minds of the profession. Now the text of the Bill is before the public, the clauses will be eagerly discussed. There is time to consider the results of the sections dealing with the limitation of the amount of light of a dominant owner, and how the limit is to be estimated in practice, and the best mode of calculating the obstruction. It will be objected by the dominant tenement owner that the clause will restrict his business, and prevent him from making a claim for obstructed light in certain cases. The amount of light "reasonably necessary for the comfortable use and enjoyment" of a dwelling-house is different to that which is necessary for a place of business or trade. Who is to decide how much light is necessary in each case?—also the extraordinary amount of light necessary for certain trades and occupations? Greater objection may be taken by some owners to the section which provides that obstruction of light by notice is to take the place of physical obstruction. The clause runs thus: "The owner of a tenement which is not at the time servient to another tenement, but over which such other tenement would in course of time become dominant, may serve on the occupier of, and upon any other persons whom he knows to be interested in the tenement which would become dominant, a notice called an 'Obstruction to Light Notice.'" The result of this notice is to render the access of light to the windows mentioned obstructed as if they were really and physically obstructed. The so-called dominant owner will think this notice an aggravating interference with his present rights, for the servient owner may effectually prevent his opposite neighbour from enlarging his premises. The provision, however, is a less objectionable form of procedure than an obstruction by boards. Subject to any relief which may be granted before the expiration of one year from the service thereof by a Court, the Obstruction to Light Notice will be equivalent to an interruption which has been acquiesced in for a year by the person so served. No doubt there will be defenders of the present barbarous system of physical obstruction who would rather submit to be blocked out when the time arrived. We, however, prefer the amended form; it is less harsh, and is a more business-like way of informing an adjoining owner that the servient owner has a right of light he wishes to maintain. No one can possibly find fault with the section which

provides that a servient owner who intends to erect a new or alter an old building is, at the request of the dominant owner, to give facilities to him or his surveyor to inspect the plans and elevations of any such building, or inform him of what is to be done. The provisions for certificated plans of buildings about to be taken down are also a reasonable way of allaying any ill feeling or difference that is likely to arise.

The Building By-laws in force are sometimes vexatious and exacting in their demands as applied to private buildings, and the question of reform has been discussed much of late, and will again demand attention. We lately referred to the efforts of the Building By-laws Reform Association, established last year with the object of securing that official control of private buildings shall not be extended beyond the demands of public health and safety. Individuals are at present often hampered by unreasonable by-laws. In the rural districts there has been fear of the encroachment of urban regulations which are quite unnecessary and troublesome, leading to much disagreement and litigation. In these and other places the by-laws should have reference only to the requirements of health and safety against fire, and not restrict the design of buildings in any undesirable manner. The Model By-laws issued by the Local Government Board are in general reasonable on this ground, and they omit many objectionable clauses which have been introduced into some of the rural districts. The effect of foisting urban by-laws on rural districts may be noticed in several of our country villages and seaside resorts, and the architectural tourist may very usefully compare notes during his rambles.

THE SELECTION OF MATERIALS.

AFTER the art of design, the selection of suitable materials, methods, and treatments is the most important duty of the architect; but the hurried and perfunctory manner in which this duty is often discharged is sufficient apology for the remarks we are about to make. The most usual mode is to specify certain goods and manufactures that the architect has chosen before for very different purposes or situations, or that have been recommended to him by clients or tradesmen, or which have a reputation on the market, without any inquiry as to their fitness or suitability in the circumstances. Another plan is to obtain from leading firms of tradesmen quotations of prices or catalogues, from which a selection is made. The average commercial practitioner who gets large commissions has little time and less capability or discrimination to consider the merits or defects of any manufacture. He passes over the trade catalogue to his client, or thinks this or that will answer, and the thing is done, or he simply leaves the choice to the contractor. Either of these courses is fatal to all good architecture, and to that sense of responsibility which the professional man should try to promote. There are many causes which have operated to divert the architect's attention from the details of his work—the growing multiplicity of trades, specialism, contracting, competition in prices; all of which things are more complex than they were some years ago. Division of labour or machine production has been, for instance, one main reason of the diversion of the architect's attention, of the want of interest he takes in selecting his own goods. So many materials and patterns are in the market that there is a greater task than formerly in making a choice. The price also enters into the question. Beyond this the architect's work has increased in complexity. He has more to think about than to make tests of bricks, stone, and steel beams, or to examine the patterns of a catalogue of iron grates or

chimney-pieces or decoration. Still, so long as he assumes the position of the architect, he has a responsibility in seeing that his design in its several parts and details is suitable and in good taste. It was a bad day for the profession when the architect relegated so much of his work to the trades, and only confined himself to the general design of the building. We are afraid it is very usual for the architect to limit his attention to the preparation of the contract drawings and specification and general superintendence, leaving all the fittings and decorative work to tradesmen. All continuity of motive and thought in the several branches of the design is thus lost. The coherence of the whole, the unity of design seen in the best work, is nowhere to be found. Selection implies a knowledge of the conditions, a preference of one material or mode of execution and treatment over another. Let us first consider materials in general. The very design of a building depends so largely on whether brick, stone, terracotta, or iron is to be employed, that we cannot conceive an elevation of a building that does not take into account this factor of selection, and yet we see designs for buildings which may just as well be executed in stucco as in brick. We all know the direct influence of material in all the old buildings, how the style was dictated by the local materials in every historic period, how the details of mouldings and decoration were influenced by the hardness of the granite, stone, or brick. Yet we have seen designs only suitable for stone carried out in brick, the architect changing the material to reduce cost at the last moment, as if the architecture was of the most accommodating nature. During the best ages the material always was first thought of; to-day the opposite course is followed: the drawings are first made, and then the architect proceeds to select the material which he thinks will be suitable. Or a mode of working the face is decided upon after the elevations of a stone building are prepared, instead of being made the motive of the design. A soft, easily-worked stone substituted for a hard limestone ought to make a difference in the treatment of design; so in wood, a design prepared for oak should be modified if pine or soft deal is used, and thus it may be shown that selection of material ought to precede the design in the mind of the architect: conversely, to make a design for any purpose and then to select the materials in which it is to be executed at random is an objectionable course to follow. But so it has been till lately. The style of a building has been thought of before the design and material. The happiest designs have been those that have been prepared in the locality of certain materials which are well known and worked by quarrymen and hands who have practised the trade from time immemorial; the least successful those which have been prepared in, say, a London office hundreds of miles away from the actual work, and for which the materials and modes of workmanship have been selected and specified without reference to the building or design, to suit exigencies and cost of carriage. A great deal may be said about the choice of materials and the adaptation of design to suit them. How much depends on hardness, facility of working and handling. The selection of stone, bricks, timber, or other ordinary materials may be a matter of mere cursory examination and preference, or be based on scientific inquiry. The architect, in his selection of bricks to bear any special stress, or to be used in piers, vaults, and other parts of a building, must depend on tests carried out in a systematic manner. On the Continent and in America such tests are conducted with precision, and are made the subjects of university and technical school teaching for the architect, as in the scientific schools of Harvard and Cornell Universities, &c. The cementing prop-

erties of cements must be determined by briquettes, and these must be made in properly constructed machines. Even the cementing power of rock-dust for road construction has to be tested. In selecting stone the architect ought to be acquainted with the properties of the particular kind he thinks of using, whether it is a sandstone or limestone. He may choose a stone for its colour or texture; but before he can safely employ it he ought to ascertain its crushing resistance and its durability in the atmosphere. For the purposes of piers and pillars the crushing strength is important, and he may for this reason select a sandstone which will have a resistance of between 500 and 700 tons per square foot. Some of these stones are hard and free working, and their absorption of water is important; others are untrustworthy. Perhaps the Derbyshire sandstones or "grits" are the most reliable: they weather well and carry a fine arris, and the colour is pleasing, as in the Darleydale varieties. Then the Mansfield red and white stones are often favoured by the architect, and some care is necessary to select a suitable texture, as a crystalline gritted stone, or one that can be easily worked and suitable for ornamental details or for dressings. If the architect is building in Yorkshire he has many admirable stones to choose from, such as Bramley Fall, Parkspring, Scotgate Ash, Robin Hood, Spinkwell, and Runcorn—all durable stones which weather and wear well, and of various shades of colour, from brown to blue. If he is selecting in the South or West of England, he has at his command a variety of limestones: Portland stone with 95 per cent. of pure carbonate of lime in its composition, quarried in three different beds, that are used for all architectural purposes, from the fossilised "roach bed," used for quay walls and breakwaters, to the fine crystalline "whit bed," suitable for the best buildings, and smooth in texture and of excellent weathering quality. Or he has in the West of England the free working oolite,—Bath stone in its many varieties, as in Box Ground, Combe Down, Corsham, Corngrit. Here also he has to be careful in making a selection, as these have all a resemblance to each other, and can only be distinguished by careful examination, as some of the Box varieties do not weather well, or are coarse; others are soft, and suitable only for internal use. He has to determine, therefore, first the physical qualities, the composition, resistance, weathering properties, texture, absorption, &c., and secondly those qualities of an artistic kind, like colour, before he can provide the stone suitable for his particular work. Knowledge of old buildings in which these stones are used is a valuable aid in selection. In the selection of timber the same general characteristics, physical and artistic, have to be considered. The latter properties come more into play in wood. The useful series of articles appearing in these pages on "Building Timbers" give the reader the means of determining which of the Memel or Riga firs and oaks are the best for particular purposes of building. As the writer points out, many terms are used that mislead. For instance, Memel or Riga "fir," when sawn into boards, becomes, in the trade phraseology, "deal," and the two terms are much confused in specifications, or are used indiscriminately for the same wood. Many architects, in specifying oak, fail to distinguish the qualities, for, as this writer says, "There are no less than two hundred varieties growing in the United States alone," besides the Canadian. A good deal of American oak has a twist very prejudicial to joinery. The best of it comes over in logs. "Wainscot oak" is often specified, but its meaning is not often understood in the trade. Some builders seem to think it is a kind of oak without any reference to its use. The writer of the articles we name very judiciously remarks: "The use of the term 'wainscot,' in describing oak, will assuredly lead some day to

one of those disputes lawyers are so fond of. For what is 'wainscot'? and what kind of oak is 'wainscot oak'? Wainscot is the panelled woodwork which is fixed against the walls of a room, and which covers these walls from the skirting to the ceiling cornice." But he goes on to say that in Hatton Garden and other parts of London the old houses are so wainscoted in the halls and best rooms; but the wood used is seldom other than pine—not from Canada, but Memel or Riga yellow, cut from logs called at the time "deal." Many mistakes have been made in the provision of timber and wood for joinery, but the subject is a difficult one. "Fir," "deal," and "battens" are specified of such and such a kind. There are set phrases used which mean almost anything. In the selection of hardwoods, for instance, for ornamental joinery, a flagrant mistake is noticed in the articles referred to. The chief object should be to exhibit the grain, and therefore it should be cut and selected specially with that object in view, whether in the framing or the panelling. The panel should, of course, be selected from the most ornamental parts of planks; the framing is better straight-grained and without "figure." The stiles and rails are the constructive parts, and ought to form a contrast to the panels, which should be cut from the figured portion of the wood. In a recent free library extension reference is made to a wall dado, 4ft. high, of pitch-pine. The woods used are painted or polished, and therefore the grain is hidden or accentuated. This writer says the joinery is rendered patchy by using woods of different shades of sapwood and heartwood, the effect of which is intensified in the varnished portion of the work. These mistakes of colour and grain are often seen in modern work; perhaps in a panel one half is highly figured, the other half plain, which, of course, renders the joint visible, where it ought not to be noticed. In work of this sort the way the wood is cut across the grain is important in the exhibition of "figure," for it may cut radially or tangentially. For varnished work, as this writer says, all the pieces for framing and panelling should be selected for the positions they are to occupy. As a matter of fact, the architect does not trouble about the matter. It is left to the contractor or his foreman of joiners, and the easiest convertible pieces or the readiest to hand are used. A clause in specifications for all ornamental joinery should provide that the architect should have submitted to him for his approval all hardwoods to be used in framed work, that the panels should be selected out of pieces with good "figure," and of even colour, and that at the joints (if any) special care should be taken to avoid any contrast of colour or grain in the pieces placed side by side; that all the rails and stiles are to be of approved wood, straight-grained, &c. In door framing especially the rule should be strictly observed. Unless a close supervision is exercised, deals are used that are not only unlike in quality, but of different shades, as cut from the heartwood or sapwood; unevenness of colour is also caused by the process of drying. But selection of timber and "deals" implies a general knowledge of the various kinds of wood used in building, the pine, red or yellow, and other varieties, the modes of conversion, of seasoning and drying. Very few in the profession can distinguish readily between Russian and the Norwegian and Swedish deals and battens; and the great variety of other woods that come from America and New Zealand require a special study. Canada red pine and America yellow pine are valuable woods for joinery, though of course not equal to that from the Baltic in strength. American oak is apt to be mistaken for English oak. Then there is not only pitch-pine, a red, tough, and durable wood more suited for varnishing than painting, but other kinds of

North American pine, like the Oregon, Quebec, and St. John's, Kaurie pine from New Zealand, and a large number of woods from Tasmania adapted for ornamental purposes, the special qualities, colour, and "figure" of which can be only acquired by experience. It is well for the architect to determine which of these several woods is best suited for any particular joinery. Many of them are well adapted for varnishing, others may be better painted. A good deal of the wood framing prepared for ordinary houses and buildings specified to be varnished is of so indifferent a kind that painting would be desirable.

In the choice of such things as fittings considerable judgment is called for. They should not only be convenient in position, but suitable for the purpose. The architect is directly concerned with the building fittings, especially those specified for business premises, such as inclosures of wood in banks and offices, counters, cases for goods, drapers' and chemists' fittings, the desks and seats in schools, library fittings, council chambers, and courts of law. The technical school and laboratory have special arrangements and fittings of benches and closets for physical and chemical experiments. Now, the selection implies a knowledge of the planning and use of these special fittings: how they are used to the best effect, the greatest ease of the sitter or student; if a desk or a bench, its economic construction, so that no waste of material, or unnecessary length, height, or width is allowed. Cases for books or other articles must in the same way be regulated in height, to save trouble in getting books, &c., from shelves, which should be of easy reach, and their position in the room has to be studied, that no area of floor be wasted, or an awkward corner left. In furniture selection the same rules ought to be observed; but this is generally left to the client and the furniture dealer.

To take another instance—decoration. It is at least curious that in the selection of methods and treatments so essentially artistic as those of wall and ceiling designs in plaster, Carton-pierre, Lincrusta, Anaglypta, and other substances, and also in the selection of wallpapers and colour schemes, requiring good taste, culture, and a keen sense of artistic discrimination and feeling, the client, or often his wife and lady friends have the matter in their own hands. As one writer remarks, for some reason or other difficult to explain, the decorator leaves the selection of wallpapers to his customer, who is in many cases absolutely incapable of choosing suitable designs. Yet so it is. The decorator, as Dr. Dresser said, can only explain his mode of action by assuming his ignorance of the art. Instead of suggesting to the client the kind of decoration suitable, he asks him how he wishes the room to be treated, whether he wants a dado or not, the kind of wallpaper, whether a plain or floral design, and the usual formula is, "I will send you a pattern-book to choose from." The same writer puts the pertinent question, What should we think of a medical man if he asked his patient how he should like the complaint treated, and what medicine he would prefer? We all know the truth of these remarks. Architects are not always blameless in this respect; they sometimes submit designs with similar confidence in their client's taste. The mistake is in supposing that decoration is governed by no other law than those of a capricious fancy. Though there is a little more common sense and caution exercised by decorative artists now, the client is too often the judge of what the design or the wall-paper should be. The tenant or owner visits the showrooms of a wall-paper dealer and makes a selection in the same way as he would in selecting the material for a garment. Without the slightest principle to guide him, he chooses a pattern that pleases in design or colour, without any

reference to the use of the room, its size, height, and lighting. The decorator is presumed at least to have a knowledge of the fundamental principles of art, and especially their application to his own work, but, alas! the competition in the trade quenches all desire to study the art or to instruct his customers. The decorator and the trades connected with him have to make a living, which supposes compliance with the wishes of their customers, a desire to please the popular taste. The architect at least can offer a protest to any bad choice, or persuade his client to adopt another design or pattern; but the tradesman is not in the same position. He sells his wallpapers, and it would be inimical to his trade to refuse his customer any design which he takes a fancy for. Of course, the customer's taste must be consulted; it is a factor in the solution, but not the only one. There are rules to be observed, based on physical and æsthetic laws. The selection of the pattern of a wallpaper or fibrous plaster decorations like those on the market ought to be ruled by the dimensions of the room, especially its height. If the room is large, a bold pattern may be suitable; if at the same time it is low, the design ought to be such as will give prominence to vertical features, that a vertical striped or panel design would do. But the design and colour of the paper should be controlled by other considerations. Chief amongst these are light and aspect. A south or south-east aspect will stand a more subdued tone of colour with advantage than a room with windows facing north or east. A badly-lighted room should have a light and cheerful paper; in fact, the light and aspect of room are the most important considerations in selecting wallpapers, though the rule is not generally observed. When pictures are to be hung in a room, the wallpaper should be a plain ground tone that will form a suitable background to the pictures. Any decided or bold pattern, or a florid design, would be absurdly out of place; yet how often we find pictures hung on walls covered with rich-coloured papers, which violently "quarrel" with the colours in the pictures? Then the use of a room, whether it is a dining-room, or study, or drawing-room, or bedroom, must be considered, and a paper chosen that will give pleasure or repose to the occupants. Decided and florid papers are, of course, utterly out of place in bedrooms or studies, though they may do well in dining and drawing rooms. These are simple rules to follow, but they are often wofully disobeyed. The wallpapers and decorations are specified to be of such-and-such value per piece or per yard, and no one takes the trouble about the design until the walls and ceilings are ready for them. A hasty selection is then made, perhaps, by the client and his wife, or the architect or builder; if they have no preference, they allow the decorator to make his own choice. We do not say this is the usual course when the architect is responsible, but it is common enough. An idea prevails that anything of a decorative character may be left to the "fancy" of someone who knows very little about it. The consequence is a waste of material and artistic effort. The picture frames, the carpets and ceilings, the upholstery and drapery, and furniture are all chosen without any rule of suitability or harmony, although they should have added materially to the architectural design and sense of completeness of the whole. We can hardly, indeed, think the architectural design of a building is seriously carried out when no attempt has been made to select proper materials and decorative adjuncts in agreement with the general intention and the rules of good art. We have only to look back at the old buildings and examples, or to the work of a few of our leading men, to see that this result can be attained.

THE TRADES' TRAINING SCHOOLS.

THE report of the judges on the work done at the Trades' Training Schools of the Worshipful Companies of Carpenters, Joiners, Painter Stainers, Plasterers, Tyllers and Bricklayers, and Wheelwrights, at 153, Great Titchfield-street, W., has just been published. The judging committee was composed as follows:—Messrs. John Willson, J.P., Master of the Worshipful Company of Carpenters (chairman); J. Hutton Freeman, Clerk to the Worshipful Company of Carpenters; Henry Phillips and T. Rider, Worshipful Company of Joiners; J. D. Craee, Hon. A.R.I.B.A., and M. C. Cowtan, Worshipful Company of Painter Stainers; W. Shepherd, Worshipful Company of Wheelwrights; George J. Newson and W. Grellier, Worshipful Company of Tyllers and Bricklayers; Aston Webb, R.A., P.R.I.B.A.; H. T. Hare, F.R.I.B.A., President of the Architectural Association; George Frampton, R.A.; Professor R. Elsey Smith, A.R.I.B.A.; Richard Parry, F.S.I., A.M.I.C.E.; S. Stevens Hellyer; and H. Phillips Fletcher, F.R.I.B.A., F.S.I., A.M.I.C.E., Director of the School.

The judges report that the work carried out in the Carpentry class continues to be of a progressive character—some of the exhibits showing a great amount of forethought and knowledge in their execution. The judges would, however, recommend that students in framing the principals of roofs, partitions, &c., should pencil on the face where straps, collars, ties, bolts, &c., are to be fixed. They would also recommend that in the case of all exhibits, when possible, it should be stated whether the student is responsible for the design or only the workmanship of the model, and in the latter case the source from which the design is taken. Albert Daley has been awarded for the third year in succession a special silver medal. Bronze Medals and £1 in books have been given to W. E. Sanders and E. J. Beasley, and a Bronze Medal and 10s. in books to B. Henbest. In the Joiners' class the judges express satisfaction at the improvement shown in the finished exhibits. A new feature this season is the air-tight eave. The Henry Phillips Silver Medal has been awarded to J. Vince, and Bronze Medals and £1 in books to F. J. Parker and W. King.

The judges regret to find that the work in the Masons' shop is most disappointing. They are accustomed to see some of the best work here, and the meagre display now shown does no credit to either the instructor or the students. Some of the unfinished work shows good promise. The Bronze Medal and £1 in books goes to G. Scrase.

The work of the Painters' class shows an improved attention to technical excellence in practical work. The specimens of writing, also, are executed more cleanly and with better finish than hitherto. The specimens of stencilling are not very satisfactory, either in the choice of design, in its application, or in the colouring. This seems partly due to the influence of poor designs published in trade journals, and often quite unfitted for good work. The first prizeman's work maintains a high average throughout. The second, who also has done well, has come from New Zealand to improve. First prize (Silver Medal) is given to Herbert Spencer Nott, and the second prize (Bronze Medal) to Edward John Bell.

The judges are glad to note the more healthy tone now prevailing in the Plasterers' class, and hope that even higher efforts will be made in the future. The Silver Medal is taken by B. George, and a special Silver Medal for modelling by W. Nellin.

As usual the Plumbing work is excellent, though the general standard is perhaps not quite so high as in some previous years. A special prize of £2 in books is awarded to F. J. Mitchell (former recipient of Silver Medal), a Silver Medal to John Cole, and a special Silver Medal for bossing to Charles Wildry.

The Smiths' class shows a very marked improvement, and the work done is most creditable. The judges would like to see more work finished, and think that shafting should be fitted to the drill, and, if possible, a screw-cutting lathe should be added. Bronze Medals are given to F. Bell, J. Hartnell, S. Brooker, and J. Pugh.

The work exhibited in the Stone-carvers' class is far in advance of any previous work, and the judges are glad to find that such good use is made of the excellent studios. The proposed addition of a life class will no doubt still increase the usefulness of this class. A special

prize of £2 in books goes to W. R. Jones (a former recipient of Silver Medal), Silver Medal and £1 in books to J. W. Hanchet, and a Silver Medal to A. Bowler. A Bronze Medal and £1 in books to M. Borchardt, a Bronze Medal to W. Wilson, and a Bronze Medal for modelling to E. Forrester.

The Tyllers' and Bricklayers' class has now advanced to the front rank, and the works exhibited are more numerous and show greater skill than in former years. The judges are glad to be able to award to Charles Fry the Banister Fletcher Medal, as being the best craftsman in the schools. A Bronze Medal is given to W. Domini, and £1 in books to W. Flaherty (a former recipient of Bronze Medal), the two students being bracketed equal. A Bronze Medal is also given to G. T. Crabb.

In the Wheelwrights' class the attendances during the session have been quite up to the average. The exhibits are as numerous and meritorious as in previous years, and show great care and attention to the instructions given. First prize is awarded to W. R. Crookford, and the second prize to W. F. Willment; a special prize, given by the master of the Wheelwrights' Company for drawings, to A. A. Gilderson.

The judges regret to see the poor number of exhibits in Mr. Horsey's class of Wood-carvers. The works shown by Mr. Moutries' pupils are as numerous as usual, and are on the whole fairly creditable. In the latter class the Bronze Medal is given to T. H. Groves, and the second Bronze Medal for modelling to F. Pennelli. In Mr. Horsey's class the Bronze Medal is taken by J. Coxell.

PLANNING AND FITTING-UP OF LABORATORIES.*

THE design and building of schools of technology has so rapidly extended, that any work which deals with the details and fitting-up of such buildings must be of value to the architect. Except the work of the late Mr. E. C. Robins on "Technical School and College Building," published nearly twenty years ago, and therefore rather out of date, we do not remember any English treatise on the subject. Mr. T. H. Russell, M.A., who has had much experience in working out the details of fittings for the chemical department at the Manchester Municipal Technical School, has now brought out a volume on the "Planning and Fitting-up of Chemical and Physical Laboratories," which deals comprehensively with the subject. The work is illustrated with 36 plans and drawings of laboratories, details of fittings, &c., and will be found useful to architects, in preparing their working drawings of lecture-rooms and laboratories. The illustrations give plans, perspective views, elevations, and sections of benches, draught closets, sinks, shelves, lecture tables, &c. The development of technical education has increased immensely the requirements of schools, and many of the earlier schools of this class have had to be remodelled, and their fittings superseded by newer ones. No scientific institution is so varied in its requirements, and the complexity of the fittings and apparatus required increases with the number of students. Mr. Russell first indicates, by plans, the arrangement of the fittings of a room for elementary teaching. One of these shows a table and three benches placed parallel to each other at distances of about 2ft. 9in. or 3ft. in the centre of the room. The length of bench space allowed to each pair of children would be about 2ft. 6in. or 3ft., the benches are about 2ft. 4in. wide, 2ft. 8in. high, made of deal, treated with paraffin. The room measures by scale about 26ft. by 24ft., or nearly square, lighted on one side. A draught closet is at one corner, and a cupboard at another, with blackboard on the wall between. Near is a sink, and sinks are placed along one of the sides of room and a balance-shelf on the opposite side. The demonstration table is about 14ft. by 2ft. wide. Ordinary classrooms are often fitted up for practical work, fixed benches cannot be used, and wall-benches are found useful. These are, in fact, cupboards containing shelves against the walls projecting about 8in. or 9in., with hinged doors beneath the bench tops, which are 2ft. wide. Two types with fold-up top are illustrated. A sink is placed at the corner of room. The doors open from the working bench, which can be supported on folding brackets. Another

plan shows separate chemical and physical laboratories with one lecture-room suitable for a small school. These plans are drawn to scale, and show convenient arrangements. The physical laboratory has three tables in centre of room, blackboard, and cupboards and sink, with inclosure for balances at one end. The Birchfield-road, Liverpool, school is of this character, a plan of which is given; the laboratories are separated, and form right-angle blocks, with lecture-room between. Part II. deals in more detail with chemical laboratories. The author says: "When the chemical department occupies only a portion of a building, it should be either on the top floor or disconnected from the rest of the building by a lobby or corridor through which a current of fresh air is always passing. The object of this arrangement is to intercept any fumes that may escape from the laboratory." Besides the lecture room, which may be separate or combined, smaller rooms are required for balances, combustion work, lecture preparation, and stores. An advanced laboratory and a teacher's room should also be provided. The main laboratory is fully described; it should be large and well lighted and ventilated. Top-lights and side windows are desirable if possible. A height of 14ft. is given as the least height. The author says a "ridge and furrow" roof, with the glass slopes inclined at an angle of 60° and facing north and east, is an excellent arrangement. Every part of the laboratory is fully described. The ideal arrangement is that in which the convenience of the workers is consulted, that they can carry out their experiments with the minimum amount of moving about; but opinions differ about the fitting-up of laboratories. The main fittings, working benches, sinks, and draught closets are fully illustrated and described. The bench may be the single or the double back-to-back bench, a perspective of which is given. The following several arrangements for benches are noticed:—(a) Single benches across the room like the desks of a classroom with side gangways; (b) single benches round the room against the walls; (c) single benches against the long walls and a double bench (or benches) down the middle of room; (d) double benches lengthways, down the room, or (e) double benches across the room with side gangways. These different arrangements are found in certain schools; (a) is proposed to be adopted in the County Technical Laboratories at Chelmsford, and it is also the best for elementary science rooms. Method (b) is not desirable: method (c) is adopted at Battersea Grammar School and numerous other laboratories; method (e) is followed at the East London Technical College, Chelsea Polytechnic, &c. For a given plan of laboratory, the allowance for bench space per student can only be determined by plotting the benches and gangways. The author allows 30sq.ft. to 36sq.ft. of floor area per student, including gangways. For quantitative and organic analysis more space is necessary than for students doing qualitative analysis. The length of bench-space per student is about 3ft. 6in. to 4ft. The dimensions of double benches, which vary in width, from 4ft. 6in. to 5ft. and other dimensions are given. And there are illustrations given of demonstration tables, double working-benches, draught closets, &c., but into these details we cannot enter. Illustrations follow of fittings and apparatus—such as evaporation-closets for various cases, and the sizes of each fitting. Physical laboratories form a third part of the book, in which the rooms, their dimensions and the space required, and the fittings are very fully dealt with. The last part, on ventilation and warming and lighting, will be found of interest. The value of Mr. Russell's book to the architect of technical schools and laboratories is that the arrangement of the plan, the pattern and size of each fitting, allowance of space per student, are given in a concise and portable form.

ST. ALBAN'S THRONE.

THE new choir-stalls for St. Alban's Cathedral were designed by Mr. J. Oldrid Scott several years since. As originally drawn, they had an upper range of tracery rising some four feet above the canopies; but this was disallowed by Lord Grimthorpe. At this time only the return stalls, with their canopies, &c., were carried out. It was decided a few months since that the completion of the stalls with a new throne should form the memorial to Bishop Festing, and the tender sent in by Mr. Bridgeman, of Lichfield, was accepted. The stalls will cost about £2,500,

* The Planning and Fitting-up of Chemical and Physical Laboratories. By T. H. RUSSELL, M.A. London: B. T. Batsford, High Holborn.

*S. Alban's Abbey
Design for
Bishop's Throne
1903.*

and the throne about £600. The latter was designed by Mr. Scott lately, and the whole work now well in hand, and is to be dedicated on St. Alban's Day next year. The choir at present terribly disfigured by the massive organ with a Norman case. It stands most conspicuously in the ancient stone screen just west of the stalls.

It is hoped, however, that means may be forthcoming at an early date for rearranging the organ and supplying new cases of suitable design.

On Monday the electric cars from Dewsbury to Cleckheaton, by way of Heckmondwike and Liverpool, commenced to carry passengers.

UNIVERSITY COLLEGE, LONDON.

NEW DAY SCHOOL OF ARCHITECTURE.

THE inaugural lecture (Subject: Architectural Evolution) of the New Day School of Architecture will be delivered by Professor Simpson on Wednesday, October 7, at 5 p.m., when the chair will be taken by Mr. Aston Webb, R.A. elect., President of the Royal Institute of British Architects.

The session is divided into three terms, as follows, all the dates being inclusive:—First term, from Tuesday, October 6, till Friday, December 18. Second term, from Tuesday, January 12, till Friday, March 25. Third term, from Tuesday, April 19, till Saturday, June 18, for lectures. Class examinations will begin on Monday, June 20. Class-lists and awards of prizes and of scholarships will be announced on or about Tuesday, July 5, when the session ends.

The Principal and Professor Simpson will attend from 10 a.m. to 1 p.m. on Monday, October 5, and Tuesday, October 6, for the purpose of giving advice and information to students entering the college. The matriculation examination, which students are strongly advised to pass before beginning the course, begins on Tuesday, September 22. Applications for admission must be made to the secretary on or before September 8.

Systematic day courses for architectural students will be started in October. Students who have already had some experience can join any of the lectures or classes by the year or by the term, but the principal course extends over three years, and at the end of it the college certificate can be obtained. This course is intended primarily for students who wish to become architects, and should be taken by them before they enter an architect's office. The need for such a preliminary training cannot be insisted upon too strongly, although it will still be necessary for students who have taken the course to spend some time in an office before commencing practice. A pupil who goes straight from school into an office generally wastes the greater part of his first year or two, because much of the work he is set to do is unintelligible to him. Even what he does understand, he picks up in a disjointed manner, and often remains in ignorance of the most elementary facts.

The advantages of a preliminary course are briefly these:—(1) The training is systematic and continuous; (2) all details of construction, some of which in an office are often omitted because they are taken for granted by both architect and builder, are fully worked out and explained; (3) the student has to think for himself from the first, and not merely to interpret the thoughts of others, and yet he receives far more personal supervision than can ever be given by a busy architect in practice; (4) the saving of time is considerable, as none is wasted over drawings and tracings which the student does not understand; (5) it tests his fitness for the work, and weeds out the unfit. No articles are signed which bind him to a term of pupilage. At the end of the first year he is free to go or to remain.

The advantages to the architect are as great as to the student. It is true that with a pupil thus trained he receives a smaller premium, and that the term of pupilage is shortened; but instead of a raw youth to whom the most elementary detail has to be explained, he has a trained student who from the first should be of some assistance.

The architectural course at University College is framed, in the first place, to provide a systematic training in the practical and aesthetic sides of architecture, and in subjects closely allied to it; and, in the second, to encourage students to continue their general education, and so bring them into touch with other students in other departments, who are pursuing different courses of study. The college already possesses in its Slade school of fine arts, its large engineering laboratories, and its comprehensive arts and sciences classes, valuable aids to a school of architecture. Advantage will be taken of these, so far as is possible, having regard to the limited time at the student's disposal, so that the course should not be entirely on technical lines, but on liberal lines also.

To further this, stress is laid on the necessity for a thorough grounding in the history of architectural development. The planning, construction, and general principles of the masterpieces of ancient and modern times will be explained. The aim of the lectures on Architectural History will not be to cram a student's brain with names, dates, and dimensions, but to enlarge his mind,

stimulate his imagination, and interest him in his art.

A special course will be provided for architectural students by the Professor of Mechanical Engineering in steel and iron construction, and in the testing of materials.

THE THREE YEARS' CERTIFICATE COURSE.

The College certificate will be granted to students who have passed the Special Matriculation Examination or some other examination (such as the London University Matriculation) accepted in lieu of it, have presented certificates of attendance in three of the subjects mentioned below under "first year," and have satisfactorily passed through the full architectural course.

Students who have taken their B.A. degree at any university are exempted from the matriculation examination and from the general subject mentioned under (a) in the first year, and can obtain the College certificate at the end of two years instead of three.

The composition fees payable are 45 guineas for the first and 35 guineas for each of the two following years. These admit to all the lectures and classes of the course.

The Donaldson Silver Medals are awarded to the two most successful students at the end of the course.

MATRICULATION EXAMINATION REGULATIONS.

1. The examinations for this certificate are held twice each year, beginning on the second Tuesday in May and the fourth Tuesday in September.

2. The fee payable is one guinea. Should a candidate fail, he will be readmitted on payment of half a guinea.

3. Candidates must give notice of their intention to enter for the examination not later than fourteen days before the date of the commencement of the examination.

4. The fee must be paid at the office of the College, and an entry-form obtained by each candidate before he can be admitted to an examination.

5. Candidates must pass in—

(1) English: one paper, three hours;
(2) Mathematics: two papers of three hours each; and in two of the following subjects, one only of which may be a modern language, one paper of three hours in each subject:—

(3) and (4) Latin, Greek, French, German, Italian, Spanish (or any other modern language may be accepted if two months' notice is given by the candidate); Elementary Physics, Elementary Chemistry, Architectural and Free-hand Drawing, Elementary Mechanics.

SYLLABUSES.

English.—A general paper comprising questions in Geography, History, and Literature.

Mathematics.—Ordinary rules of Arithmetic; Approximate Calculations; use of Logarithmic Tables; Mensuration of Areas and Volumes; Algebra, including the Binomial Theorem; Euclid, Books I. to IV. and Book VI. Props. 1 to 7; Trigonometry, including the Solution of Triangles.

Languages.—Translation, Prose Composition, and Grammar.

Elementary Physics.—Elementary Heat, Light, Electricity and Magnetism.

Elementary Chemistry.—Including the Principal Properties of Matter, the Laws of Chemical Affinity, Atomic Weights, Valency, and the Chemistry of the Principal Inorganic Elements.

Architectural and Free-hand Drawing.—Drawings to scale and from the cast.

Elementary Mechanics.—Velocity, Acceleration, Laws of Motion, Mass, Force, Work, Energy, Rectilinear Motion, Composition and Resolution of Forces, Elementary Hydrostatics.

First Year:—

(a) Three of the following:—

History (Ancient or Modern). English Y. French Y. German Y. Mathematics Y. Chemistry Y. 1. Elementary Mechanics Y. 1. Junior Graphics Y. 1.

The above are the lectures and classes for students who have already passed or have been exempted from the Matriculation Examination. Other students will have special courses arranged for them.

(b) Drawing from the Antique, two half-days a week.
(c) Building Construction.
(d) History of Architectural Development.

Second Year:—

(a) Engineering Class Special Course, 1st and 2nd Terms.

A Course will be delivered by the Professor of Mechanical Engineering dealing with iron and steel construction in buildings (roofs, girders, stanchions, &c.), and laboratory tests on cement, bricks, stones, concrete, timber, iron, steel, &c.

(b) Drawing from Antique or Life, two half-days.
(c) Perspective.
(d) Building Construction.
(e) History of Architectural Development.
(f) Surveying Z. 2.

In their Second or Third Year students should attend the evening lectures on Quantity Surveying.

Third Year:—

(a) Hygiene Z. 1.
(b) Modelling, two half-days a week; or Life-Drawing, two half-days a week.
(c) Architectural Planning and Design (see below).
(d) History of Architectural Development (see below).

Third Year Students might with advantage attend the lectures on Greek and Egyptian Art.

Students who receive special permission will be allowed to work in the classes of the Trades' Training School, Great Titchfield-street, during their second and third years.

A.—BUILDING CONSTRUCTION AND DESIGN.

First Year.—Lecture. Wednesday, 11 to 12.
Brickwork, masonry, concrete, mortar; carpentry, lating, tiling, external plumbing; simple iron roofs, concrete floors; stone and concrete stairs and the materials.

Studio Work.—Exercises are set bearing on the subjects lectured upon.

Note.—This Session the lectures will not be given until after Christmas, as the new premises will not be open until then. Students will devote extra time to Drawing from the Antique.

Second Year.—Lecture. Tuesday, 10 to 11.
Soils, foundations, hollow walls, joinery, plastering, internal plumbing, pointing, glazing, drainage, shoring, underpinning, and the materials.

Studio Work.—Exercises as above.

Third Year.—Lecture. Wednesday, 10 to 11.
The planning and designing of simple buildings, which includes further exercises in the different trades previously lectured upon. Designs will be worked out and detail drawings made. Specifications, &c.

The lectures will be delivered when necessary, and will deal with the requirements and chief points which have to be observed in each subject.

Visits will be paid from time to time to buildings in course of erection, workshops, &c.

B.—HISTORY OF ARCHITECTURAL DEVELOPMENT.

First Year.—Lecture. Friday, 11 to 12.
(Third Term only).—Greek and Roman mouldings and ornamentation; Greek buildings, their plans and characteristics.

Studio Work.—The Greek and Roman orders.

Visits will be paid to the British Museum.

Second Year.—Lecture. Friday, 10 to 11.
Roman buildings; their plans, materials, and construction. Early Christian and Byzantine Architecture in the East and in Italy. Romanesque Architecture in Italy, France, England, Germany, &c.; introduction to Medieval (Gothic) Architecture; the development of groining, &c.

Studio Work.—The plans, detail, and construction of the above.

Third Year.—Lecture. Tuesday, 11 to 12.
Medieval (Gothic) Architecture in England, France, Germany, and Italy. The Architecture of the Renaissance in Italy, France, England, Germany, Spain, &c.

Studio Work.—Sketching plans, details, &c.

In the second and third years visits will be paid to buildings of interest in and near London, which are examples of the different periods lectured upon.

STUDENTS NOT TAKING THE CERTIFICATE COURSE.

Students not wishing to go through the Certificate Course can take merely the Architectural and Drawing from the Antique Classes, devoting the whole of their time to these.

For 30 guineas for any one year, or 12 guineas a term. Students can attend the History of Architectural Development Lectures without joining a Studio Class.

For any one course, £5 8s. a year, £2 2s. a term.

Students cannot attend the Building Construction lectures without joining a Studio Class.

Fees for any one Course of Lectures: Building Construction, or History, and 1 day a week Studio, £10 10s. a year, £4 4s. a term; ditto and 2 days a week Studio, £14 14s. a year, £5 15s. 6d. a term; ditto and 3 days a week Studio, £18 18s. a year, £7 7s. a term.

WORKING DRAWINGS, BUILDING CONSTRUCTION, AND MEASURING AND ESTIMATING.

Professor, F. M. Simpson, F.R.I.B.A.; Instructor in Measuring, E. J. Burr; Demonstrator, A. Bachman.

For fuller particulars, consult the separate programme of these Classes.

The Carpenters' Company being desirous of extending the instruction in the above subjects, the following Evening Classes (the expense of which is borne by the Company) at very moderate fees will be held under the direction of the Professor of Architecture.

These Classes are free to Students entering for any of the Courses named above.

C.—EVENING CLASS FOR CONSTRUCTION AND WORKING DRAWINGS.

Two Evening Classes for the study and drawing of Building Construction—one elementary and one advanced—will meet on Thursday evenings in the First and Second Terms—viz., Elementary from 6.45 to 8; Advanced from 8 to 9.15. A Lecture will be given by the Demonstrator each week.

Instruction in Drawing will be given by the Demonstrator, and the principal subject of the examination in Building Construction held by the Education Department will be taken up.

Professor Simpson will deliver two or three lectures during the Session on Designing in Material.

Fees.—For either Class for a Term, 10s. 6d.; for the Session, £1 1s.

D.—EVENING CLASS FOR MEASURING, QUANTITIES, AND ESTIMATES.

Two Evening Classes—one Elementary and the other Advanced—for the study of Measuring, taking off and preparing Quantities, and the principles of Estimating, will be held, during the First and Second Terms, under the direction of Mr. E. J. Burr. The system followed is that of Mr. Rickman.

Elementary on Tuesdays from 6.30 to 7.45.

Advanced on Fridays from 6.30 to 7.45.

Fees.—For either class for the Session, 10s. 6d.

Students will be permitted (under proper regulations)

to use books from the Technical Library of the Carpenters' Company.

N.B.—Students obtaining a nomination from the Carpenters' Company will be admitted either to the Lectures or the Evening Classes at half-fees. Applications should be addressed to the Clerk of the Company, Carpenters' Hall, E.C.

FERROUS SULPHATE AS A COAGULANT IN THE MECHANICAL FILTRATION OF WATER.

By ERNEST E. IRONS, Bacteriologist.

IT is well known that a number of chemicals, including some of the salts of iron, when introduced into water containing carbonates, are decomposed with the formation of a more or less gelatinous coagulum, the reaction being analogous to that which occurs when alum is added to water. However, in the case of iron salts the presence of the carbonic acid liberated in the reaction renders a small portion of the iron hydrate soluble, and it hence passes through the filters in amounts which are inadmissible in a water to be used for domestic purposes. The system now used at Quincy aims to obviate this difficulty by the neutralisation of the carbon dioxide by the addition of a suitable amount of lime water. A certain proportion of the precipitated iron is oxidised to the ferric state. In addition to the carbon dioxide set free in the reaction, the river water normally contains a certain amount in solution, which must also be neutralised by the lime water. Both iron and lime have been used separately in a number of processes for the purification of water and also together in the chemical precipitation of sewage (Massachusetts Board of Health reports), but so far as can be learned they have not been employed hitherto in the same manner as at Quincy in the purification of drinking water. The system was installed in July, 1902, and has been in continuous operation since that time. It consists of the addition to the raw water of solutions of ferrous sulphate and lime water in the proper proportions, with resulting coagulation, followed by rapid subsidence in a specially constructed basin and filtration through Jewell mechanical filters.

The plant consists of a house on the river bank containing pumps, two 7,000-gallon tanks for the lime solution, and one 3,700-gallon tank for the iron solution, a sedimentation basin and filter house on the side hill above, and a storage reservoir on the heights some two miles distant. The Mississippi River water flows into an in-take well, is raised by a low-pressure pump to the basin, flows back by gravity to the filter house, and passes through the filters to the high-pressure pump, which forces it to the reservoir. The iron solution enters through the suction of the raw water pump, and the lime-water is introduced after the passage of the raw water through the pump. The water, charged with the solutions, passes to the sedimentation basin, 70ft. by 70ft. and 9ft. deep, divided into four compartments, and around the compartments under and over top and bottom baffles. In this passage through the basin, which requires one and a half hours, the water undergoes considerable clarification, so that at the outlet, where it weirs over into a shallow steel trough, it contains only a small fraction of the suspended matter contained at the inlet.

In September, 1902, a series of experiments were instituted to determine the several factors involved in the process, and its efficiency and cost. The experiments were renewed during the period December to February, and again in the latter part of March. Bacteriological and chemical analyses of the water from the intake, the inlet and outlet of the basin, the several filters, and from the effluent of the high-pressure pump, were made at intervals daily, together with observations on the relation of the suspended matter in the river water to the coagulation and clarification in the basin, with varying quantities of coagulant.

The carbon dioxide in the raw and filtered water, determined by titration with sodium carbonate, was found to vary somewhat from day to day, and was subject to occasional larger fluctuations which could not be correlated with other changes in height of water, rain, temperature, &c., so far as these could be determined. The quantity varied from 5 to 22 parts per million during the period of observation.

In September the number of bacteria in the river water as determined by the plate method averaged about 35,000 per cubic centimetre. Later, during December and the early part of

TABLE I.—FINAL RUN, MARCH 24-27, 19 3.

January, the numbers were somewhat lower (25,000 to 35,000 per c.c.), rising considerably in the latter part of January and early February (50,000 to 100,000 per c.c.). During the latter part of March the numbers averaged about 80,000 per c.c. Some observations on the occurrence of *Bacillus coli communis* in the river water serve to further indicate the degree of pollution of the Mississippi River by sewage.

In October, during the preliminary tests, the temperature of the river water varied from 16° to 20° Centigrade. During most of the winter period the temperature was slightly above the freezing point, rising during the latter part of March to 7° Centigrade. In passing through the surface condenser of the raw-water pump, the temperature of the water is raised about 1° Centigrade. The slight seasonal variations in temperature appear to play an insignificant part in the reactions taking place during the process of purification.

It is manifestly impossible here to more than outline the results obtained with sulphate of iron at Quincy. The principal points of interest are those relating to the qualities of iron and lime required in the process, the method of application, the part played by the sedimentation basin, and the bacterial efficiency obtained.

The lime water is made by slaking lime in a hopper placed above the lime-solution tanks. It has been found that lime of the quality obtainable at Quincy gives one grain of calcium oxide for every 1.43gr. of commercial lime. This ratio varied from day to day with the "fatness" of the lime, so that the cost of lime for each day's run is not always proportionate to the grains of calcium oxide used per gallon of water treated. The amount of lime-water to be applied to river-water varies with the amount of CO₂ in the river-water, and with the amount of sulphate of iron added. Some recent studies seem to indicate that rather more lime has been used in obtaining good results in practice than is theoretically required. This may be accounted for partly by minor reactions in the water, and partly by unavoidable error in the estimation of the CO₂ by the method employed.

The sulphate of iron crystals are dissolved in water in the proportion of 4oz. of sulphate of iron to one gallon of water, and the solution added at a fixed rate to the river-water. Owing to certain difficulties with the filters, which have since been remedied, accurate data regarding the efficiencies which may be obtained by using varying amounts of the coagulant could not be obtained. However, in treating relatively clear waters (turbidity 10-20) in which a high degree of pollution was present (e.g., 100,000 per c.c.), it was found that the efficiency of the plant could be materially raised by increasing the iron from 1.5gr. per gallon to 2gr. or 3gr. per gallon. When this was done, the coagulum was correspondingly greater in amount, and while tending to settle somewhat more rapidly in the basin, gave as well a greater efficiency for the filters computed on the basis of the character of the settled water reaching them. With high turbidities (500-1,500) it has been found desirable to use more of the coagulants; but even with the highest turbidity noted during March (1,500), the average iron required was 3.70gr. per gallon. This is more significant when taken in connection with cost of operation.

The estimation of the quantity of iron used is based on the quantity of the above solution added to the water, and the figures refer to grains of ferrous sulphate crystals (FeSO₄ 7 H₂O) per gallon of river water, assuming the iron solution to be of full strength (1,750 grains per gallon). The quantity of lime water used is based on the quantity pumped from the lime tanks, the strength of each of which was determined by titration. The amounts used are computed in

grains of calcium oxide (CaO) per gallon of river water.

As an example of the determinations made daily, the results obtained in the final run are given in Table I. These results are confirmatory of earlier tests made in September, 1902.

It should be noted that in this run with turbid water, the high efficiency of the basin (95.8) would have rendered a good efficiency possible even though the filters had been in a lower state of efficiency. The determination of iron in the river water was made on samples without filtering through paper, and hence represents an amount of iron far in excess of that actually dissolved in the water. On the other hand, filtration through paper failed to remove the finest portions of suspended matter, so that a determination of the iron in such a sample would represent neither the total nor the dissolved iron. The filtered water (average of four days, 10 samples per day) contained .05 parts per million of iron (FeO). Iron in this quantity in water has no practical significance.

Perhaps the most striking feature of the above table is the high degree of purification obtained in the passage through the basin. The employment of a coagulant of relatively high specific gravity favours sedimentation, and this, combined with the use of the basin for rapid settling, obviates to a large degree the difficulty of treating highly turbid water, by utilising the suspended matter to hasten sedimentation and purification. The figures giving the per cent. of wash-water are somewhat misleading, inasmuch as approximately 17.5 vertical feet of wash-water are used at a washing, whereas in newer types of filters from 5 to 6 vertical feet are required. The high efficiency of this and the fall runs was not maintained throughout the entire winter period; but, judging from the data obtained, it is believed that under conditions entirely realisable in a suitable plant, results as good as those of the fall and spring runs may reasonably be expected.

Table II. shows the cost of coagulants at Quincy for the first nine months, July, 1902, to March, 1903.

TABLE II.—COST OF QUINCY PROCESS, JULY, 1902, TO MARCH, 1903.

Month.	Aver. Turbidity.	Pounds per million gallons.		Grains per gallon.		Cost per million gallons.			CO ₂ p.p.m.

Mar.	579	451	262	3.15	1.31	1.84	.68	2.46	10.30
Av.	—	291	294	1.96	1.45	1.16	.68	1.84	11.58

During July and August the river was turbid. The average of three analyses made during July and August gave suspended matter 305 parts per million. This is probably somewhat below the actual average, as the summer of 1902 was remarkable for its heavy rains and high stage of the river. The average cost per million gallons for the five months ending December 1 was 1.65dol. These costs are computed on the basis of sulphate of iron at 40 cents per cwt., and lime at 22.5 cents per cwt. up to January 1, 1903, when the price rose to 25 cents per cwt. With reference to the bacterial efficiency obtained throughout this period, no data are at hand except those of run No. 1 (September 29 to October 4), during which an average efficiency of 99.0 per cent. was obtained for the filters. However, we have found that whenever a fair amount of

turbidity is present in the water, the efficiency has been satisfactory, and, since throughout almost the entire period from July to November the river was in a turbid state, it seems fair to assume that a satisfactory efficiency was maintained at the costs named.

With reference to the costs during December, January, and February, several facts must be taken into consideration. The turbidity was comparatively low; but, on the other hand, the pollution for much of the time was high. To meet the conditions, more iron was used than was necessary to coagulate the water. In March occurred the first flood of the year. The average turbidity of the water treated was 579, which represents an amount of suspended matter of between 500 and 600 parts per million. The average cost of coagulants on five days, when the average turbidity was 1,500, was 2.78dol. per million gallons.

The following features of the process are worthy of note:—(1) The weight of the coagulum formed by the iron favours sedimentation. (2) The sedimentation basin rapidly removes the larger part of the suspended matter, and thus allows the treatment of highly turbid water without preliminary sedimentation in large and expensive reservoirs. (3) The suspended matter is utilised in the purification of the water, and hence, in a way, is an aid rather than an obstacle to purification. (4) The cost of wash-water for the filters is but little higher in periods of turbid water than in times of clear water.

The filtered water is clear and bright, and small pebbles are easily visible at the bottom of the covered storage reservoir through 20ft. of water. Bacteria of the colon type appear to be removed by the filtration in about the same ratio as are other bacteria. As to the removal of colour from the water by the treatment no data were obtained, owing to the fact that during the period of the tests the colour in the Mississippi River water was very small in amount, and any determination made would not be of much value in the consideration of the effect of the process on waters containing large amounts of colouring matter of possibly different composition.

In the operation of the Quincy plant no attempt has been made to provide for the neutralisation of the trace of caustic alkalinity appearing in the effluent. In inspection of the determinations of caustic alkalinity occurring in the effluent of the plant in normal operation shows that on some days no caustic alkalinity was detected. Usually a slight alkalinity was present, varying between 1 and 5 parts per million. (Estimated in terms of calcium carbonate.) The permanent hardness is necessarily slightly increased, as in other processes involving the use of sulphates, while the temporary hardness is decreased, the resulting total hardness being considerably reduced.

So far as observed at Quincy, the process appears to compare favourably with other methods of purification in point of efficiency and cost, and seems to be particularly adapted to the treatment of water in which periods of high turbidity are encountered. The author wishes to express his thanks to Mr. C. R. Henderson, superintendent of the Quincy Waterworks, for his interest and assistance, and to the American Steel and Wire Co., of Chicago, the manufacturers of the ferrous sulphate, for their courtesy throughout the work.

—The Engineering Record.

THE BRITISH ASSOCIATION AT SOUTHPORT.

THE thirty-eighth annual meeting of the British Association will take place the week after next at Southport, a town last visited just twenty years ago. The meeting, which begins on the evening of September 9, will be presided over by Sir Norman Lockyer, who will

probably in his address deal with spectroscopical observations, and advocate the endowment of scientific research. Three evening lectures will be delivered in the Cambridge Hall. The first of these, on the Friday evening, will be by Dr. Robert Munro, on "Man as an Artist and Sportsman in the Palaeolithic Period." The Monday evening discourse will be by Dr. Arthur Rowe, on "The Old Chalk Sea and Some of its Teachings," while the lecture to working men on Saturday evening will be by Dr. J. S. Flett, who will give an account of his observations on the recent volcanic eruptions in the West Indies. Section A, Mathematical and Physical Science, will be presided over by Mr. C. V. Boys, and several of the papers to be read in this section will treat upon recent discoveries and speculations as to the nature of radium. Professor W. Noel Hartley will preside over Section B, Chemistry. He proposes, in his presidential address to give a brief account of twenty-five years' work in spectroscopy, applied to the investigation of the composition and constitution of terrestrial matter, both organic and inorganic. Professor W. W. Watts, secretary of the Geological Society, in his presidential address to Section C, Geology, will urge the importance and uses of geology in practical life. He will advocate its adoption as a subject of ordinary education. Among the papers in this section will be one by Mr. G. W. Lamplugh on the disturbance of Junction-Beds from Differential Shrinkage during Consolidation; another by Mr. J. J. H. Teall upon the Recent Work of the Geological Survey, and a third by Mr. H. W. Monckton on Sarsen Stones. A number of papers dealing with particular features of the geology of various localities have also been arranged for, including an account by Mr. J. Lomas of the geology of the country around Southport. The first report of the committee appointed at Belfast to investigate the fauna and flora of the Trias of the British Isles will be presented; it deals with the study of foot-prints, and Mr. Beasley furnishes the bulk of the report. Section D, that of Zoology, meets under the presidency of Professor Sydney H. Hickson, and Section E, Geography, under that of Captain Etrick W. Creak, C.B., R.N., who proposes to treat of the connections between geography and terrestrial magnetism. Among the papers to be read in Section E are those by Mr. J. J. Parry, of Liverpool, on the Afforestation of Waterworks Catchment Areas, and by Mr. E. A. Reeves, curator to the Royal Geographical Society, on Improved Methods of Survey for Travellers. Section F, Economics, Science, and Statistics will be presided over by Mr. E. W. Brabrook, C.B. The president of Section G (Engineering) is Mr. Charles Hawksley, and the papers to be read in this section include one by Lieutenant-Colonel Crompton, R.E., C.B., on "The Problem of Modern Street Traffic," another by Mr. J. Clarkson on "Steam Propulsion on Roads," a third by Mr. W. F. Goodrich on "Refuse Destructors and Power Production"; and among other contributions will be papers by Mr. Bell on "Oil Fuel," Mr. Woodhouse on "The Newcastle Power Works," Mr. T. Parry on "The Water Supply of South-West Lancashire," Dr. Campbell Brown on "The Growth of Organisms in Water-Pipes," and Mr. B. Hopkinson on "The Paralleling of Alternators." Professor J. Symington, of Queen's College, Belfast, is the president of Section H (Anthropology). Dr. Arthur Evans, Mr. J. L. Myres, and Mr. R. C. Bosanquet will offer reports on this year's excavations in Crete, Mr. J. Garstang and Mr. Currelly on recent work in Egypt, Mr. G. Clinch on a Surrey monument illustrative of certain points in Stonehenge, Mr. Annandale on stone implements from Iceland, Dr. C. S. Myers on the Ruins of Kharga in the Great Oasis, Mr. T. Ashby on Roman work at Caerwent, and Mr. Garstang on Ribchester; while a report will be made as to the Silchester excavations. Professor Ridgeway will read a paper on "The Origin of Jewelry." Section K (Botany) will meet under the presidency of Mr. A. C. Seward, whose address will be devoted to the subject of fossil plants, and Sir W. de W. Abney, K.C.B., will preside over Section L (Educational Science).

BOOKS RECEIVED.

San Pictures of the Norfolk Broads (Ashstead, Surrey: P. Jennings) has reached a third edition. It is illustrated by about 100 photographs of the picturesque Norfolk and Suffolk borderland by PAYNE JENNINGS, the descriptive letterpress being furnished by E. R. SUFFLING. — *Jarvis's Guide to Great Yarmouth* (Norwich: Jarrold and Sons) is abundantly illustrated and well written. The chapters on Charles Dickens and on the Rows will be read with interest, and although we may not entirely agree with Peggotty that the town is "on the whole the finest place in the universe," it possesses in itself and surrounding neighbourhood many attractive features. The architectural tourist will find it a good centre from which to visit the Cathedral at Norwich, with its wealth of Norman and Perpendicular work, and the numerous 14th and 15th century examples of church architecture with which the district is thickly set, not the least interesting being the great parochial church of St. Nicholas, which dominates the Market-place of Yarmouth itself. A useful addition to future editions of the book would be a map of the coast and a plan of the town. — *Holidays in Eastern Counties and Summer Holidays in East Anglia* are illustrated booklets by PERCY LINDLEY, published under the auspices of the Great Eastern Railway Company. — *Roof Framing Made Easy: a Practical System adapted to Modern Construction for Laying Out and Framing Roofs*. By OWEN B. MAGINNIS, architect, Inspector of Buildings of the City of New York. Second edition, revised. (New York: The Industrial Publication Company). — This little manual is intended to instruct students in carpentry, who desire to become proficient in this particular branch of construction. It is full of diagrams of roofs for every purpose, and the author shows how to lay out the lines of roof-framing without unnecessary cutting and waste. The chapters originally appeared in a series of articles in *Carpentry and Building and The Carpenter*. The chapters show how to lay out and frame roofs of every kind. In the laying out of simple roofs the description of finding out the hip-rafter's length is not quite clear: the point N is not determined, though the diagram given explains. Hip-and-valley roofs, roofs of irregular span, pyramidal and polygonal roofs, conical roofs, truss roofs, framing a church roof, mansard roof, hemispherical domes, &c., are all explained, and illustrated by diagrams, plans, and sections, which accompany the list. The methods shown are practical and easy, and the student of carpentry will find Mr. Maginnis's book a useful guide in framing roofs of various shapes on geometrical principles.

CHIPS.

A stained-glass window has just been erected in Holy Trinity Church, Scarborough, in memory of the late Rev. J. A. Faithfull, a former curate of that parish, and rector of Whitechapel from 1900 to 1902.

At Mornish, Perthshire, the Elvira Henderson Memorial U.F. Church was formally opened on Monday. It is built of stone, and is furnished in oak. In the east wall is a stained-glass window which itself cost £1,300.

On Saturday afternoon Archdeacon Barber, of Chester, dedicated a new stained-glass east window which has been erected in St. Michael's Parish Church, Coppenhall, Crewe.

The new schools, Egremont, Cumberland, are being warmed and ventilated by means of Shorland's patent Manchester grates and special inlet tubes. The same being supplied by Messrs. E. H. Shorland and Brother, of Manchester.

A stained-glass window has been placed in the Congregational Church, Wheathampstead, as a memorial of the late Rev. J. S. Hoppus, for 27 years pastor. It represents the Saviour holding the cup of Communion, and has been executed by Messrs. Jones and Willis, of London.

The Madras Railway Company have completed and opened another section of their Calicut-Azikh Extension between Tellicherry and Cannanore (13 miles); and are pushing on with the Azikh-Mangalore Extension, the construction of which they have in hand on behalf of the Government of India.

On Saturday Lieut.-Gen. Sir John French unveiled a war memorial at Retford in memory of the Sherwood Rangers Imperial Yeomanry and members of the Regulars, Militia, and Volunteers who died in South Africa during the late war. It took the form of a large tablet erected on the grand staircase of the Retford town-hall.

OBITUARY.

We regret to announce the death, on Wednesday at Marstrand, Sweden, of Professor WILLIAM HENRY CORFIELD, sanitary adviser to his Majesty's Office of Works, and professor of Hygienic and Public Health at University College, London. Dr. Corfield, who was in his sixtieth year, was educated at Cheltenham Grammar School, Magdalen College, Oxford, University College, London, and the medical schools in Paris and Lyons. Among the appointments which he filled were those of honorary sanitary adviser to University College and Hospital, president of the Epidemiological Society of London, vice-president of the Sanitary Institute, and past-president of the Society of Medical Officers of Health. For the last twenty years he had been an Honorary Associate of the Royal Institute of British Architects. In 1868 he was appointed examiner for honours in the Natural Science School, Oxford, and he discovered the existence of lithodorous borings in the Aymestry limestone of the Silurian formation, and "thus removed to an earlier age than had been previously known the evidence of boring bivalves." He was not only the first professor of hygiene appointed in London, but he started the first hygienic laboratory, which was at University College. For six years he was a member of and reporter for the British Association Committee on the treatment and utilisation of sewage, and he originated, in 1891, the meeting of the International Congress of Hygiene and Demography in London. The Royal Society of Public Medicine in Belgium awarded Professor Corfield a bronze medal in 1901 for his work in connection with public health. For 20 years he was chairman of the committee of the Sunday Society, the object of which is the opening of public museums and libraries on Sunday. In addition to being a member of many foreign scientific societies, he was a prolific author of works connected with public health, and as a fluent and lucid lecturer his addresses on sanitary topics were much valued. Among his publications are a "Résumé of the History of Hygiene," "Dwelling Houses: their Sanitary Construction and Arrangements," "The Laws of Health," and "Disease and Defective House Sanitation," which was translated into French, Hungarian, and Italian.

It is with much regret that we hear of the death, on the 22nd inst., of Mr. THOMAS WARDROP, one of the senior members of the firm of Harris and Wardrop, builders and contractors, 10 to 14, Wallwood-street, Limehouse, E. The business will be carried on as heretofore by the remaining partners, Messrs. Edwin Harris, Clarence Gregory, and James Wolfe King.

An accident took place at Woodhatch, Reigate, on Thursday morning in last week, resulting in the death of Mr. W. Wood, architect and surveyor, of Ifield, Crawley. Mr. Wood and a friend had taken part in the cycle carnival at Reigate on behalf of local charities, and were returning home. The night was very dark, and Mr. Wood ran his machine into a letter-box fixed on the side of the pavement. He was thrown to the ground, and was picked up dead by his friend, having broken his neck.

THERE were interred at Prestwich on Friday the remains of the late Mr. JAMES LAMB, a well-known Manchester man, who died at Kenwood, Altrincham, on the 14th inst., in his 87th year. The deceased was born in Quay-street, Manchester, on January 2, 1817. He learnt the trade of a cabinet-maker and upholsterer, and about the year 1841 set up in business on his own account at 24, Bridge-street, moving in 1848 to John Dalton-street in that city. Many years afterwards he built a spacious furniture warehouse in the same street, which he occupied until the amalgamation of his business with that of Messrs. Goodall a few years ago.

The extension of the joint Harbour Station at Portsmouth is now complete. The extension is built upon wrought-iron girders, resting upon cast-iron piles 18 in. in diameter, screwed by steam power to a firm bottom. Messrs. J. W. Jacomb-Hood and Mr. C. L. Morgan were the engineers for the joint companies, the resident engineer in charge of the works being Mr. W. Davidson. The contractors were Messrs. John Aird and Co., of Westminster, represented by their manager, Mr. A. C. Reid, formerly resident engineer to the South Australian Government service. The whole of the wrought and cast iron was supplied and erected—save the screwing of the cast-iron piles—by Messrs. Head, Wrightson, and Co., Ltd., of Thornaby-on-Tees.

The St. Pancras Borough Council have made £46,612 profit on their electric-lighting plant in ten years.

The will has been proved of Henry Loxley, of Southbourne, Hillsborough, Ecclesfield, builder, who died on June 9. Gross value of estate, £9,041; net personal estate, £4,352.

Building Intelligence.

ARMAGH.—The cathedral of St. Patrick, which has been for nearly two years in the hands of the builders, is now nearing completion, so far as the present restoration is concerned, and will be formally reopened on September 4. The new east window, filled with glass in memory of the Beresfords—Lords John, Marcus, Gervais, and Mr. Beresford Hope—will be dedicated. It replaces an old stunted window, with patchwork glass and pointed stone tracery and mullions, and is a reproduction of the choir window, portions of which were discovered built up in the wall when the masons were cutting the space for the new window. Sir Thomas Drew promptly adopting the older portions and incorporating it in the design. The roof has been considerably raised, the old imitation lath-and-plaster work having been taken away and the roof timbered. This necessitated a lining of the chancel throughout with stone, and a raising of the tower openings east and west.

FELIXSTOWE.—Arrangements have just been concluded for the erection, at Felixstowe Dock, of a 200-quarter steep malting for Messrs. J. Gough and Sons, of Bury St. Edmund's, and for the building of eight workmen's cottages, four to be used in connection with the malting, and the other half for dock hands. These buildings will be raised on the South Quay. The Felixstowe Dock Co. have decided to develop the North Quay, so as to provide the extra berthing accommodation required. The work will entail a cost of upwards of £10,000, and the malting, cottages, and concomitant sidings and connections with the Great Eastern Railway system a further £20,000 or more. The dock company's engineer, Mr. John Russell, who has also been superintending the erection of a sea wall and promenade, has now made arrangements for piling and concrete work sufficient to carry the large building. In the first instance separate tenders were sent in for the foundations; but it was subsequently considered desirable to place the whole of the South Quay work in the same hands, and Messrs. Spencer Santo and Co., of Kensington and Felixstowe, have been successful in obtaining the combined contracts, and the work is to be commenced forthwith. The architects are Messrs. Evans and Son, of Nottingham. The extension of the dock itself will be carried out by Messrs. P. W. Symmons and Co., Cannon-street, E.C. Their contract requires them to excavate the present temporary concrete-covered slope, erect a straight quay-wall, and dredge down to the deep sea level of the dock. The working facilities of the dock will be further improved by the extra sidings and lines of rails as already mentioned. The present timber store will be converted to the use of the Malting Company, and it is proposed in future to do most of the timber trade at the new quay, alongside which a new timber shed will be erected.

NEWCASTLE-ON-TYNE.—On Wednesday week the memorial-stone of new buildings in course of erection in connection with the Westmoreland-road Presbyterian Church of England was laid by Sir George B. Bruce. The new buildings occupy a site which has stood vacant since the church was built in 1872, and originally intended for a manse. The additions consist of two parts—an entirely new building on the vacant site in Westmoreland-road, and alterations to the existing caretakers' buildings in Maple-terrace. The front block contains a room on the ground floor for session and managers, with small hall for week-night service and other meetings. The first floor contains a ladies' room with cloakrooms, and the kitchen, &c., for caretaker, the second floor or attics being occupied as sitting-room and bedrooms for the caretaker. In the basement there are heating chamber and lavatory accommodation. The existing caretakers' house in Maple-terrace will be made into a classroom. The building will be raised one story in height, with a vestry provided for the minister at church level instead of in the basement, the existing vestry being enlarged to form a classroom. The work has been designed by and is being carried out under the superintendence of Messrs. Badenoch and Bruce, Newcastle, architects, and Mr. J. M. Whammond, of Gosforth, is the contractor.

SOUNDWELL.—The foundation-stone of a new church was laid at Soundwell, near Bristol, on Saturday. The architect is Mr. H. M. Bennett, of Liverpool Chambers, Corn-street, Bristol, and

the building will be Gothic in character. The estimated cost for the entire scheme is between £5,000 and £6,000, but at present only about £2,500 is to be incurred in the construction of the nave and north aisle. The church when erected will seat 900 persons, and will serve a population of about 4,000. In addition to the work now to be put in hand, the scheme comprises a chancel and choir stalls, clergy, choir, and parish vestries, organ chamber, and a south aisle. The dimensions are 100ft. by 65ft. About 450 people will be accommodated in the present part of the work. The exterior stonework will be of blue Pennant, relieved with Bath stone, and the interior of free-stone. The floor will be of wood-blocks, and there will be chair-seating arrangements. Provision is made for a belfry in the west gable.

CHIPS.

His Honour Judge Lush-Wilson, K.C., and a jury of five had a long sitting at Tavistock on Saturday, when Edwin Benjamin Tregaskis, aged twenty-nine, stonecutter, of West-street, Penryn, claimed from Duke and Co., Ltd., of Tor Quarry, Merivale Bridge, Tavistock, £266 for personal injuries caused by an explosion of a dynamite cap in a shed where he was dressing stone. Under the Workmen's Compensation Act, the Court made an order that plaintiff, the sight of whose right eye had been affected, should receive 14s. 9d. weekly.

The Lord Mayor of London, Sir Marcus Samuel, laid on Friday the foundation-stone of the new Monckton Drill Hall in College-road, Maidstone. The building is being erected at a cost of £1,300, the front and gateway being faced with Kentish rag. Mr. A. W. Smith, of Maidstone, is the architect.

No fewer than 130 applications have been received from architects, engineers, and others for the position of master of works to the Glasgow Parish Council and District Lunacy Board.

Professor Boni, under whose directions the excavations in the Roman Forum have assumed such importance, has just discovered the colossal base which sustained the equestrian statue of Domitian. It stands 5ft. below the present level, and is 40ft. long, 20ft. wide, and 10ft. deep.

It has been decided that the electric trains for the Metropolitan District Railway shall be worked on the same system as was recently adopted by the Central London Railway Co. in place of the heavy separate locomotives originally used on that line. Mr. Yerkes has accordingly just placed a contract with the British Thomson-Houston Co., Ltd., of Rugby and London, for the equipment of all the District Company's new trains with the Sprague-Thomson-Houston system of "multiple unit train control," which is in use not only on the Central London, but also on the elevated railways of New York and Boston, and was recently adapted by the New York Rapid Transit Company for their new subway system now nearing completion in that city.

The demolition of the old Caledonian Asylum in Caledonian-road, which was for many years the home of the destitute Scottish children of London, has been commenced by order of the London County Council.

Mr. Pouley, gas manager to the Stafford Corporation, has had his salary increased from £400 to £450 per annum.

The Home Office have purchased several acres of land near the site of the British Museum buildings at Hendon for a central vaccine station.

The Lord Bishop of Beverley on Wednesday week dedicated a new stained-glass window of three lights in the chancel of Liverton Church. The new window is situate in the chancel over the altar. The centre light represents St. Michael, the patron saint of the church, slaying the dragon, whilst the right and left-hand openings respectively depict figures of St. Gabriel and St. Uriel. The window was executed by Messrs. Wailes and Strang, Corporation-street, Glasgow.

The proposal of the Pontefract Board of Guardians to purchase Beechwood House and Estate for £3,500, for use as a children's quarters, has been vetoed by the Local Government Board.

Messrs. C. Chancellor and Co., of 13, Clerkenwell-road, E.C., inform us that some months ago Mr. Fife, the architect, informed them that he had been submitting their Velure to severe tests for a considerable time, and had decided to use it on the *Shamrock*. She was painted before launching, and their paint appears to have given entire satisfaction. Velure has also been adopted for use both on the Sandringham Estate and at Windsor Castle, as well as on the Royal yachts. Local authorities are using it for painting outdoor work, and it has been adopted by a large number of hospitals, including the London and the Middlesex, owing to its cleanliness and its sanitary properties.

Engineering Notes.

CONNEL FERRY AND OBAN.—In connection with the opening of the Ballachulish extension of the Callander and Oban line, the Caledonian Railway Company are in course of carrying out extensive alterations and improvements at Oban and Connel Ferry stations. At Oban the platform accommodation has been largely extended and improved, there being now two island platforms, both some 600ft. in length, one averaging 35ft. and the other 20ft. in width. Adjacent to the latter platform a new approach road 30ft. wide has been formed, giving direct access to the new pier extension. The railway company are expanding on the extension of the pier and contingent improvements some £60,000, and in view of the opening of the new line these works are being hurried to completion. They comprise an additional wharfage line of 500ft., the work being constructed in timber piling, chiefly greenheart, with cattle slipways and stairways for small boats. At Glencruitten summit, midway between Oban and Connel, a new passing place for trains has been completed and opened, the line between Callander and Oban being a single one. At Connel Ferry the main up and down lines have been brought alongside an island platform of great length, and with a maximum width towards the centre of 40ft. The main station buildings are situated on the north side of the station, and waiting-room and lavatory accommodation have been provided on the island platform. The island platform is connected with the platform and dock set apart for Ballachulish traffic by an over-bridge. Extensive siding accommodation has been laid down, and two signal boxes have been erected. These alterations have been carried out from the plans of Mr. D. A. Matheson, chief engineer of the Caledonian Railway Company.

PWLLHELI HARBOUR.—Preparations are now in progress for starting the construction of the new harbour which has been designed for Pwllheli. The scheme provides for the construction of (1) an inner harbour or marine lake, and (2) an outer harbour or harbour of refuge. Within the inner harbour will be built up an island of about eight acres in extent, which will be planted and laid out. On one side of the inner harbour will be constructed a stone embankment, extending from the present terminus of the Cambrian Railway to a point near Mitre-terrace, where it will join the present Cob embankment. This will enable the Cambrian Railway Company to extend their system into the very heart of the town; and it has been agreed that the embankment shall be proceeded with first, so as to enable the railway company to erect their new railway station as early as possible. Provision will also be made by the company for a junction with the proposed Pwllheli to Nevin Light Railway. The scheme is estimated to cost something like £55,000, and towards this the Government are contributing £22,500, the Cambrian Railway Company £20,000, and the Corporation of Pwllheli £17,500.

Halifax School Board, at their meeting on Monday night, had submitted to them a proposal by the sites and building committee to invite competitive plans for the erection at Salterhebble of a school to provide accommodation for 300 mixed and 150 infant scholars, at a cost not exceeding £10,000, including mechanical ventilation.

Boring operations for testing the site of the new deep-water dock at Swansea have now been completed with satisfactory results. The trustees will shortly invite tenders for carrying out the scheme, involving two millions sterling.

The construction of a railway from Chamonix to Martigny has been begun, and at each end the first section is now under construction. When completed the total length of the line will be 24 miles, including three miles along the valley from Vernayaz to Martigny, as the junction with the main line will be at the latter and not at the former station. From Chamonix to Châtelard the new line will be in French territory, and thence to Martigny in Switzerland. The Vernayaz-Salvan section is to be completed in time for the season of 1904. The Salvan-Finhaut portion will require two years, and the Finhaut-Châtelard one more, so the whole line will not be opened till 1907.

There has just been placed in the drawing-room at Auckland Castle, among the portraits of his predecessors, a replica of the portrait of the late Bishop Westcott in the Fitzwilliam Museum at Cambridge, by Sir William Richmond, R.A.

PROFESSIONAL AND TRADE SOCIETIES.

ASSOCIATION OF MUNICIPAL AND COUNTY ENGINEERS.—The members of the Incorporated Association of Municipal and County Engineers held a Northern District conference in Aberdeen on Thursday in last week. On Friday the delegates made a number of visits of inspection to places of interest in and near the city, amongst others the bathing station, the Aberdeen granite works, the Adamant works and Dancing Cairns quarry, Slopefield and Mannofield reservoirs, and Culter pumping station.

YORKSHIRE BUILDING TRADES FEDERATION.—The monthly meeting of the executive of the Yorkshire Federation of Building Trade Employers was held at Scarborough on Friday, Mr. J. Dawson (Muddersfield) presiding. There was a large attendance of representatives. A new apprentice indenture form and a new form of contract agreement were approved, the latter being recommended for use by all architects and engineers. A report on the joiners' dispute at Sunderland was read, and it was resolved to give the masters the necessary support in the event of a stoppage of work. It was decided to hold the next meeting at Billington in September.

CHIPS.

Mr. Edward Daniel Bridges, aged 51, retired builder, of Gloucester-street, Cirencester, died suddenly on Monday, about 5 p.m. He had been in ill-health for some time.

At Burrow-in-Furness, on Tuesday, Princess Louise, Duchess of Argyll, opened the new Technical School, erected at a cost of £1,500, as a memorial of the Diamond Jubilee of Queen Victoria.

The rural district council for South Westmorland have directed Mr. Harrison, C.E., of Preston, to prepare detail plans and sections of a 5in. main pipe from Lupton Fells, near Kirkby Lonsdale, for the supply of Lupton, Farleton, Heversham, Levens, Holme, Milnthorpe, Storth, and Araside. The main will extend about 12 miles, and the supply will be 100,000 gallons daily, while the cost is estimated at £10,000.

At the forthcoming congress of the Library Association at Leeds, Mr. Norris Mathews, the city librarian of Bristol, has been asked to open a discussion on the important question of "Library Architecture and Planning." Mr. Norris Mathews, having initiated the opening of the new branch libraries for Bristol in St. Philip's, St. George, Cheltenham-road, together with a smaller one at Ridgway, his practical advice was sought in connection with the new Central and Reference Library, to be erected in D-aurey-road from designs by Mr. H. Percy Adams, of London, recently selected in competition.

On Friday in next week, Sept. 4, Colonel W. Langton Cole, of the Local Government Board, will hold an inquiry into the application of the Bradford Corporation to borrow £22,500 to defray the cost of providing district baths in Wakefield-road, Leeds-road, and in Peel Park.

The Corporation of Margate have decided to erect a sea-wall and promenade of the width of 30ft. at the east end of the town. The cost is estimated at £30,000.

The public memorial at Exeter to Sir Redvers Buller will take the form of an equestrian statue. The commission has been given by the committee to Mr. Adrian Jones.

The Newcastle Corporation have given instructions to Messrs. Wm. Potts and Sons, clock manufacturers, Newcastle and Leeds, to erect a new clock in the tower of Christ Church, Shieldfield, Newcastle-on-Tyne, and have let the builders' work to Mr. Alex. Bruce, Newcastle. Messrs. Potts and Sons are just completing a new clock at Elton Church, near Hull, to the memory of the late Col. Grimston, J.P., High Hall, Elton, from Lord Grimthorpe's designs.

The plaster of Paris and cement manufacturing enterprise of Joseph Robinson and Co., carrying on operations in Cumberland and Westmoreland, shows a decline of profits amounting to £1,623 for the year ended June. The dividend rate is maintained at 5 per cent.—not the highest in the company's history—but the carry-forward is only £137 against £1,122 brought into the account.

Work in connection with the rebuilding of Bow Bridge has been commenced. The enterprise is being carried out as a joint improvement by the London and the Essex County Councils, and, in view of the forthcoming electrification of the East London tramways, will be pushed on with all speed. The new bridge will be some 8ft. wider than the existing one, will have easier gradients, and will cost nearly £10,000.

WATER SUPPLY AND SANITARY MATTERS.

THE LONDON WATER COMPANIES' CLAIMS.—When the Court of Arbitration appointed under the Metropolis Act of last session met on October 25 next, they will have before them the claims of the eight Metropolitan water companies, amounting to £50,000,000, in addition to their debenture stock being taken over by the newly-created Water Board. The Water Board have deposited with the Court of Arbitration their answers to the claims of the East London and the New River Companies. The claim of the former company shows that the capital of the company consists of debenture stock £2,051,000 and of ordinary share capital £1,720,000. The debenture stock is taken over by the Water Board, and in respect of their nominal capital of £1,720,000 the East London Company claim sums amounting in the aggregate to £7,214,000. The Water Board replies that over and above the £2,051,000 charged which they take over, they are not prepared to offer any further sum of money in respect of the undertaking. The board points out that the available supplies of the East London Water Company are practically exhausted, and that the large district which is dependent upon them cannot be supplied in the future without very large additional expense. The company depend largely upon the water of the river Lea, which is subject to serious pollution. The New River Company claims under various heads an amount of £11,666,000. The main point of the answer of the Water Board is that the sources of water supply which the company are entitled to bring into account for the purpose of their claim will be wholly insufficient to meet the demands of the population of their district. This company will be largely dependent upon its share of water obtainable by means of the Staines reservoir scheme, in which they are partners with the Grand Junction and the West Middlesex water companies; but under the Staines Reservoir Acts, it was provided in the event of a purchase the company should not be entitled to make any claim in respect of the advantages conferred upon them by, or resulting from, the Acts. The Water Board indicate that, in addition to the liability involved in taking over the debenture stocks of the company, which amount to £2,250,000, they are willing to pay in respect of the undertaking of the company the sum of £3,090,000, which exceeds the amount that has been expended by them upon the undertaking. Under the orders made by the Court of Arbitration, which consists of Sir Edward Fry, chairman, Sir Hugh Owen, and Sir John Wolfe Barry, the answers of the Water Board to the claims of the remaining six water companies have to be lodged at various dates during the month of September.

BIRMINGHAM.—The members of the Scientific Society of the Birmingham and Midland Institute visited on Friday the new waterworks of the Corporation at Frankley. This reservoir, which is intended for the storage of the water after its long dark journey from the Elan Valley, is now ready to discharge its function. As the Welsh water scheme has not, however, sufficiently progressed to allow of this being done, the reservoir is being temporarily used for the storage of water from the present supplies, and this is pumped to Frankley from the Monument-road works in Birmingham. The basin, which has walls of masonry and a concrete floor, has a depth of 30ft., and at the present time it is little more than three-parts full. The reservoir is, to a large extent, an adaption of a natural hollow in the side of a hill, which is crowned by Frankley Beeches. On the western, the curved side, the walls are supported to a great extent by the soil, while on the opposite side, to the east, a straight wall is strengthened by an embankment 37ft. high, stretching across the country for a quarter of a mile or more. This has had the effect of closing in what was the open side of a picturesque valley. The reservoir is one of the largest of its kind in the Kingdom. It has a water area of 25 acres, with a holding capacity of 200,000,000 gallons. A stone wall 7ft. in diameter, perpendicular to the dam, divides the reservoir into two sections. Eight sluice gates near the dam will enable the two halves to be used together or separately. On the inside, where the reservoir walls are faced with blue brick, the walls have a hollow curve. Immediately behind the blue bricks, but divided from them by a thin layer of asphalt, is the main wall, formed of massive concrete blocks, backed up by a series of blue brick arches. The concrete blocks are divided by sheets of brown paper. Thus the setting of any one block, or its expansion or shrinkage through atmospheric changes, is prevented from affecting its neighbours, and so causing a weakening of the structure. The walls have an average thickness of over 30ft. at the bottom, and of about 30in. at the top. It will take a couple of days for the water to travel from the Elan Valley to Frankley. The flow will be at the rate of 2ft. a second. As soon as the reservoir fills to a depth of 30ft. an electric bell will be set ringing in the pumping station, and communication is then opened up with the Elan Valley, where water is shut off. As it leaves its source the water is quite good; but in order to rid it of any undesirable properties which

might be in suspension fourteen filter beds—quadrangular tanks, varying in size from 150ft. to 220ft. square—have been constructed. The filtering material consists of a layer of sand above layers of gravel of gradually increasing coarseness. Speaking generally, the water will flow by gravity to Birmingham. For the purpose of feeding the higher parts of the city some power is, however, necessary; but the water which will have to be pumped is equal to rather less than one-eighth of the whole supply. Two small reservoirs have been constructed, one on the hill at Northfield and the other at Warley. The water will be raised by three engines, the largest of which being of 76H.P. The lifting capacity of these engines is equal roughly to something like 1,000 gallons of water per minute. The present demands of the city upon Frankley are such that it will take about 100 days to empty one division of the reservoir. Mr. A. Wilfred Lewis, the resident engineer at Frankley, explained to the class on Friday the working of the reservoir and of the waterworks generally.

HEYWOOD SEWERAGE WORKS.—At their last meeting the health committee of the Heywood Town Council had under consideration the tenders for the construction of filtration areas at the Heap Bridge Sewage Works, including the storm-water filters; also for the construction of storm-water filters with storm-water sewers, &c., in connection with the Botany Works. The bacterial filters and works in connection therewith at Botany are being deferred until after the storm-water filters are constructed. The tenders further included the construction of a river wall alongside the Roach at Botany, which will serve as one of the outer walls for the new storm-water filters. There were six tenders, and that of Mr. James Berry, of Heywood, was accepted, the amount being under £7,000. The work is being carried out in accordance with the plans and scheme prepared by Mr. J. Diggle, C.E.

LEGAL INTELLIGENCE.

DEVIATION FROM APPROVED PLANS.—At the Llandudno Police-court on Monday, Robert Luther Roberts, a Llandudno builder and contractor, was summoned for erecting dwelling-houses without submitting proper plans to the urban district council. Mr. Conolly, clerk and solicitor to the urban council, prosecuted. He stated that in October, 1902, the council approved of plans for the erection of three houses on a site at the corner of Balfour and Harcourt-roads, Llandudno, and on June 25 this year the surveyor reported that the defendant had deviated from the approved plans, and was proceeding to erect two houses in place of the three previously intended to be erected, without submitting fresh plans. The defendant did not appear, and was fined £5 and costs.

ACTION BY AN ARCHITECT.—Before Judge Greenwell, at Morpeth County-court, Osborne Blyth, architect, Ashington, brought an action on Monday against Thomas Crozier, farmer, Sheepwash, for £516s. 6d., for drawing and preparing plans and specifications for four cottages which the defendant proposed to erect and incidental charges. The defence set up was that the defendant had not received the plans, the plaintiff having declined to hand them over pending payment of his fees and other charges. Judgment was entered for the plaintiff for 18s. 6d., the cost of advertising.

IN RE G. R. H. WALES, OF SOUTH HACKNEY.—At the London Court of Bankruptcy on Monday, before Mr. Walter Boyle, Assistant Receiver, a first meeting of creditors was held under the failure of George R. H. Wales, who was described as of 130, Cassland-road, South Hackney, builder. It appeared from the debtor's statements that he began business as a builder about twelve years ago with a small amount of capital. He had since erected a large number of houses in the neighbourhood of Acton, Chiswick, Harlesden, and elsewhere, and he attributed his present position to inability to realise various properties, and to loss on a contract. A statement of affairs was filed showing liabilities £31,794, of which £6,204 was expected to rank, and an estimated surplus in assets of £390. The debtor submitted no proposal, and Mr. A. C. Bourner, chartered accountant, was nominated as trustee to wind up the estate in bankruptcy. A committee of inspection was appointed.

The Bedwelly Board of Guardians have decided to enlarge the workhouse in accordance with plans prepared by Mr. D. Morgan, of the firm of Messrs. James and Morgan, Cardiff. It is estimated that the extensions will entail an expenditure of £27,886.

The death took place on Monday at Stranton House, Foggy Furze, West Hartlepool, of Mr. John Forster, formerly a well-known builder and contractor at Hartlepool and West Hartlepool. The deceased, who was 69 years of age, retired from business about ten years ago. Mrs. Forster predeceased her husband some years ago, but they have left a numerous family.

CENTRAL LIBRARY, HAMMERSMITH.—LANCASHIRE AND CHESHIRE BAND OF HOPE AND TEMPERANCE UNION NEW BUILDINGS, MANCHESTER.—ST. GEORGE'S PLACE, KNIGHTSBRIDGE.—THE PADDOCK, RUSKINGTON.—ST. OSWALD'S CHURCH, WEST HARTLEPOOL.—FIRST PREMIATED DESIGN FOR NEW FREE LIBRARY, MAIDENHEAD.

Our Illustrations.

CENTRAL LIBRARY, HAMMERSMITH.

IN a limited competition this design, by Mr. Henry T. Hare, F.R.I.B.A., P.A.A., was placed first by the assessor, Mr. Aston Webb, R.A., P.R.I.B.A., and is to be erected near the Broadway, Hammersmith. The whole of the designs were fully reviewed in the BUILDING NEWS, June 26, 1903. The other competitors selected by the borough council to compete were: Mr. Maurice B. Adams, Mr. Sidney R. J. Smith, Mr. J. Henry Richardson, Mr. E. W. Wimperis, and Mr. G. Sedger. Each of these competitors was paid 25 guineas towards his expenses in the competition.

THE LANCASHIRE AND CHESHIRE BAND OF HOPE AND TEMPERANCE UNION NEW BUILDING, DEANS-GATE, MANCHESTER.

THIS building, which will shortly be erected upon an excellent site in Deansgate and Bootle-street, Manchester, will be composed of buff terracotta and 2in. stock bricks. The Union will occupy half the ground floor, half the basement, and will have offices and a board room on the first floor as well as a large hall on the top floor. This hall covers most of the building area, and will be lit at the sides, and by lantern lights at the top. A carefully considered system of heating and ventilation will obtain. The basement will be let as a restaurant. The design, which is illustrated herewith, is that of Messrs. Chas. Heathcote and Sons, architects, Manchester, and was first premiated in the competition for the building.

ST. GEORGE'S PLACE, KNIGHTSBRIDGE.

THIS block of buildings is being erected in connection with the Knightsbridge building scheme, upon land the property of the Ecclesiastical Commission. A condition of the releasing of the property, which is chiefly in 20ft. frontages, was that the Commissioner's architect, Mr. W. D. Caroe, should design the exterior, and be responsible for its detail, with the object of securing a monumental result and a harmonious group of buildings. The arrangement has, on the whole, worked satisfactorily, although it is one which depends largely upon the human equation. In some cases everything has worked most easily and satisfactorily, and with general advantage to all parties, while in others endless and unnecessary difficulties have been raised, which have only been overcome by resolute insistence on the part of the freeholders. But upon important sites, which have to be largely subdivided, there is no doubt that the scheme is one that might be more frequently adopted with advantage.

THE PADDOCK, RUSKINGTON.

THE Paddock, Ruskington, for Dr. Thompson, is an old house, added to and restored by Messrs. Brewill and Bailey, of Nottingham, and on the

plan are indicated the old and new work. The accommodation provides a spacious entrance-hall, dining-room, drawing-room, consulting-room, and kitchen offices, &c., and the exterior is constructed with red brick up to the first-floor level, the upper part being covered with roughcast and roofed with red tiles. The accommodation on the first floor consists of five bedrooms, with dressing-room, bathroom, &c.; and the work has been ably carried out by Mr. Frank Pattinson, builder, of Ruskington.

ST. OSWALD'S CHURCH, WEST HARTLEPOOL.

THIS church is the gift of Mrs. Matthew Gray, in memory of her husband. It is built partly of Hesleden stone from a local quarry, and partly of Ancaster stone, which was used after the local quarry gave out, the facing inside and out being of coursed rubble blockers. The whole of the roof timbers are of pitch-pine. The floors are of pitch-pine wood blocks throughout. The chancel steps are of Languedoc and Pavonazza marble. The whole of the internal wood fittings are of oak of a somewhat elaborate description. The reredos is of oak richly carved, having sculptured panels in high relief, and carved figures in the niches, all the sculpture being from the designs of Mr. J. Eadie Reid. One of the features of the church is a rood-beam with groining and tracery below, surmounted with a handsome carved cross. The font is of alabaster, with an oak canopy, both of which are richly carved. The carving in oak is by Mr. Ralph Hedley, and the stone-carving by Mr. R. Beall, both of Newcastle. A fine organ is being built by Messrs. Ingram, Hope Jones, and Co. with electrical blowing apparatus. The church is to be lighted by electricity. Sitting accommodation for 800 is provided. A peal of eight bells is being cast by Messrs. J. Warner and Sons, who are also making the clock. The east window will be fitted with stained glass from the studio of Mr. Herbert W. Bryams, of London, also one of the windows of the morning chapel. The church was designed by the late Mr. William Searle Hicks, and is being completed under the superintendence of the present firm of Messrs. Hicks and Charlewood, of Newcastle-on-Tyne. The builders are Messrs. Thos. Dickinson and Son, of West Hartlepool.

MAIDENHEAD FREE LIBRARY COMPETITION.

THIS design was awarded the first premium by Mr. Edward W. Mountford, F.R.I.B.A., eighty-six designs being submitted. The amount to be expended was small (£5,000), which was to include fittings, furniture, fees, &c. This had to be taken into consideration when designing, and to cut down cost the librarian's quarters were placed in the roof, although none of the rooms would be attics. In cubing 10jd. per foot was allowed for superstructure above ground floor, and 6d. per foot for basement and air-spaces, making a total of £3,687, leaving £1,313 fittings, furniture, fencing, architects' and surveyors' fees. The council of the borough of Maidenhead, however, have decided to build from the second premiated design. The architects of the design we illustrate are Messrs. Blangy and Van Baars.

As a marble-producing state Georgia may, says an American technical journal, rival Vermont. The marble belt is about sixty miles in length, extending in a south-westerly direction from the North Carolina line through Pickens County. The supply is practically inexhaustible, as the depth of the deposit in many places is over 100ft. Both white and coloured varieties are found.

A new Sunday-school is being built in connection with the Nantwich Congregational church. It will have a central hall for 350 scholars, 65ft. by 35ft., five classrooms, and an infants' classroom. It will be faced with red facings, with buff terracotta dressings. The architect is Mr. Richard Matthews, and the builders are Messrs. Cox and Vaughan.

Lord Llangattock has undertaken to defray the cost of paving the sanctuary and chancel of St. George's Church, Camberwell, with marbles of various colours. He will also fill one of the upper windows—that in the south-east corner of the church—with a figure of the patron saint.

A memorial reredos at Holy Trinity, Ayr, was dedicated on the 9th inst. The reredos takes the form of a triptych of considerable dimensions and elaborate decoration, and was designed by Mr. F. L. Pearson, son of the late Mr. J. L. Pearson, R.A., architect of the church, and under whose superintendence the church, from his father's designs, was completed. The new nave of the church was opened on All Saints' Day, 1900.

COMPETITIONS.

LIMERICK CARNEGIE FREE LIBRARY AND MUSEUM.—The assessor appointed by the trustees (Mr. Ashlin, President of the Royal Institute of Architects in Ireland) awarded the first prize to the designs submitted by Mr. George F. Beckett, of Dublin, and the second prize to those sent in by Mr. George P. Sheridan, of Dublin. The trustees have decided to adopt, for the building of the library and museum, the second premiated design, as they considered the elevations of a more permanent and suitable character.

LUTON.—The selected designs submitted in a limited competition recently held for the Baptist Schools, Wellington-street, Luton, comprise a large hall with galleries around, sixteen classrooms, church parlour, infants' room, cloak-rooms, &c., and the usual conveniences. The whole of the rooms will be electrically ventilated. The estimated cost is about £1,600. The authors of the selected design are Messrs. George Baines, F.R.I.B.A., and Lt. Palmer Baines, 5, Clement's Inn, Strand, London, W.C.

STONE, STAFFS.—A committee of the Stone board of guardians have received competitive plans for proposed new tramp wards from Messrs. Jones and Hilton, who estimated that the work could be carried out for £975; Mr. J. J. Chapman, whose estimate was from £1,300 to £1,400; Mr. R. Arrowsmith, jun., £1,200; and Mr. A. P. Miller, £1,000. It was proposed that Messrs. Jones and Hilton's plans should be recommended to the board for acceptance, and an amendment that Mr. Chapman's plans, with certain modifications, should be recommended, was moved and seconded, but the voting was equal. It was then moved that both sets of plans should be submitted to the board. Mr. Chapman to be requested to amend his plans showing the combination room reduced to six beds, the corridor to 4ft., and the stoneyard wall left out, and Messrs. Hilton and Jones to amend their particulars by showing a concrete roof to the cells instead of slate; and this resolution was carried *nem. con.* It was also decided that the other plans should be produced at the board meeting. When these recommendations came before the board it was agreed that Messrs. Arrowsmith and Miller should also be conceded the privilege of amending their plans. An amendment that the whole of the plans should be laid before an expert was not supported.

At a meeting of the Leeds Art Gallery Committee on Tuesday, a letter was received from Sir Jas. Kitson, M.P., offering to present to the permanent art gallery collection a valuable picture entitled, "Her Most High, Noble, and Puissant Grace," by the late P. H. Calderon, R.A. The committee gratefully accepted the offer. The picture, which will be on view to the public on Monday next, was painted in 1865, being exhibited at the Royal Academy some years ago, and also at the Paris Exhibition. It represents her Grace of Prussia as a child of nine or ten years making a solemn procession through the State apartments, wearing her crown, and attended by maids of honour and trumpeters.

The Light Railway Commissioners have submitted to the Board of Trade for confirmation an order made by them for the construction of light railways in the urban districts of Quarry Bank, Brierley Hill, and Rowley Regis.

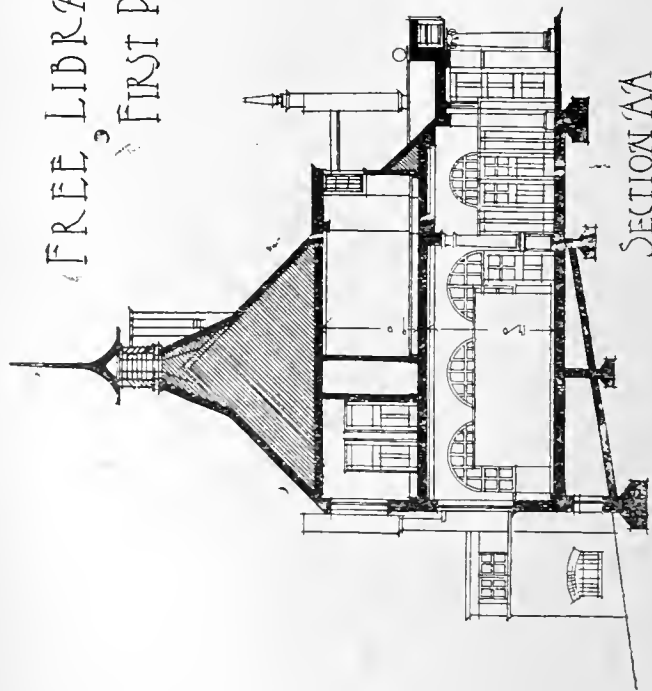

The death is announced of Alderman John Hardaker, J.P., retired builder, of Bradford. He was a member of the city council for thirty-four years. He was formerly a partner in the firm of William Hardaker and Son, contractors. He was a Conservative and a Churchman, and for many years was president of the Bradford Old Choral Society and the Bradford Musical Union.

St. John's Church, Fife, is about to be renovated and enlarged; a new chancel is to be built, also an organ-chamber, chapel, and vestries. The alterations are estimated to cost £3,000.

An invitation is being issued by the Oxford Union Society to past and present members to contribute to a fund for the erection of a bust of the late Marquis of Salisbury in the Debating Hall. Lord Salisbury was not only one of Oxford's greatest sons, but was secretary to the society in 1848, and treasurer in 1849. Already Mr. Gladstone has been similarly commemorated in a bust by the late Mr. Onslow Ford, R.A. The commission has been intrusted by the society to Mr. George Frampton, R.A.

The Local Government Board has intimated its approval of the purchase by the Leeds Corporation of the Bramley Fall Wood estate for cemetery purposes. The site proposed to be purchased comprises an area of 69 acres, and the purchase-price has been agreed upon at £13,950.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the BUILDING NEWS, Clement's House, Clement's Inn Passage, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to THE STRAND NEWSPAPER COMPANY, LIMITED.

Telegraphic Address:—"Timeserver, London."
Telephone No. 1633 Holborn.

TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 0d. (or 6dols. 30c. gold). To France or Belgium, £1 6s. 0d. (or 83fr. 30c.). To India, £1 6s. 0d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 0d.

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of eight words, the first line counting as two, the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Situations and Partnerships.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" and "Partnerships" is ONE SHILLING FOR TWENTY-FOUR WORDS, and Sixpence for every eight words after. All Situation Advertisements must be prepaid.

* Replies to advertisements can be received at the office, Clement's House, Clement's Inn-passage, Strand, W.C., free of charge. If to be forwarded under cover to advertiser an extra charge of Sixpence is made. (See Notice at head of "Situations.")

Rates for Trade Advertisements on front page, and special and other positions, can be obtained on application to the Publisher.

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page Advertisements and alterations in serial advertisements must reach the office by Tuesday morning to secure insertion.

RECEIVED.—S. T.—M. A. L.—W. R. and Co.—G. W. S.—T. M. and Co.

Correspondence.

TWO MORE UNSATISFACTORY COMPETITIONS.

To the Editor of the BUILDING NEWS.

SIR,—The following accounts of two competitions, for one of which conditions have just been issued, and of the other, information received as to the promoters' decision upon the designs submitted, may serve as a warning to intending competitors, and as a protest to promoters.

The Leyland Urban District Council advertise for competitive designs for laying out land for municipal and other purposes in Church-road and Sandy-lane. The land comprises some 11,992 square yards, part of which is required for municipal buildings, fire-station, depot buildings, &c., and part for streets and building sites.

The plan is to be made upon mounted double elephant paper to a scale of 20ft. to an inch, and is to show provision for the following:—Site for municipal buildings, fire-station, steam-roller house, three cart sheds, water-fitters' shop, lamp store (to hold 150 lanterns), scavengers' store, highways store, and a commodious stockyard; also for five private slaughterhouses. After providing for the foregoing, the remaining portion of the land is to be laid out in building sites. Sections, dimensions, areas, levels, and gradients are to be marked upon the drawings.

The council offer one premium only of 15 guineas to the author of the design placed first in their opinion; but no premium will be paid, if in the opinion of the council no design be worthy thereof.

All designs are to become the sole property of the council.

The council do not undertake to carry out the remediated or any other design, and no allowance whatever for such design beyond the premium (if

awarded) will be made, and in the event of the payment of the 15 guineas, the recipient shall not be entitled to ask the council to engage his services any further." The council "alone will decide which design shall be accepted, or to reject the whole." They "reserve the right to adopt wholly or partially any of the designs, or to work the same in conjunction with other designs."

The council are evidently under the impression that municipal buildings, fire-station, slaughterhouses, numerous stores, &c., can be satisfactorily shown upon a plan by means of certain spaces with a distinguishing colour and a descriptive note. They overlook the fact that to arrive at the necessary space required the conscientious planner would have to spend much time and thought, based upon a special knowledge of many classes of buildings and involving a fairly detailed design, before the few lines could be laid down to represent adequately the various sites. It is remarkable that public and municipal bodies should so frequently endeavour to obtain plans and information involving an amount of work on the part of the competitors immensely out of proportion to the compensation offered. The unsatisfactory nature of the conditions is obvious. It is regrettable that the profession has encouraged the public to issue such invitations by so frequently accepting them. It is to be hoped that in this instance there will be but scant response, and that as many architects as have obtained conditions will return them, with their reasons for so doing.

The instance of the recent decision of promoters is in connection with the Magnus Grammar School Competition, Newark-on-Trent. Three premiums were offered of £25, £15, and £10 for designs which should be adjudged to be of sufficient merit to be placed first, second, and third. The designs which obtained premiums were to become the property of the governors. The following is a copy of a letter received by a competitor:—"The governors of the Magnus Charity beg to return the designs for schools you kindly sent in, and regret that none of the plans submitted are, in the opinion of the governors, suitable to justify their adoption."

The governors of the Magnus Charity evidently consider that the politeness of their letter is sufficient compensation for the labour of the competitors. It is to be hoped that it may be possible to awake them to a sense of their obligation.

The members of this society were warned that this was an unsatisfactory competition to take part in, and steps were taken to induce the governors to appoint a proper assessor.—I am, &c.,
HENRY A. SAUL, Hon. Sec.

Competition Reform Society,
10, Gray's Inn-square, W.C.

A DOUBLE EVENT.

SIR,—You noticed recently that one firm of quantity surveyors had been appointed to both departments of the London County Council, and, although I have no interest in the matter, it appears to me hardly fair to the ratepayers, as there are so many good firms who might naturally desire to have some of the work. I notice that many old firms are not on the list, while some comparatively new ones have been selected. The rate of pay is not high, and the responsibility great.—I am, &c.,
FAIRPLAY.

ADEL CHURCH.

SIR,—While thanking you for the extremely interesting and well illustrated article upon the above in your current issue, it occurs to me that some of your readers may be glad to know that a most able paper on the subject, by the Rev. G. Lewthwaite, is to be found in the *Transactions* of the Associated Architectural Societies of Lincoln, York, Sheffield, Northampton, Bedford, Worcester, and Leicester for the year 1868. The paper is illustrated, and is especially noteworthy from an antiquarian point of view.—I am, &c.,
NEVILLE B. DAVIS.

89, Clarendon Park-road, Leicester, Aug. 24.

ST. MARY'S CHURCH, ISLINGTON.

SIR,—This church, erected in 1751 at a cost of £7,340, is now being restored at a cost of about £13,000. This is the greatest waste of money possible. The old nave should have been pulled down, the tower only being restored and retained. A nice new church, with proper nave and chancel, could be erected for the amount—a credit to the parish.

The present barn-like nave is badly built, ugly in design, and the stained windows are bad in design and colour; yet the existing east window, it is reported, will be used again at the end of the new chancel. The ugly galleries will also be retained.

What the parishioners are thinking about I cannot imagine, as there is not a single feature of interest in this product of a time when art was dead, and Church matters at a very low ebb.—I am, &c.,
CANONBURY.

MEASUREMENT OF OBSTRUCTED LIGHT.

SIR,—With reference to your article under the above heading in the issue of the 21st inst., I would point out that Mr. Molesworth's ingenious theories do not deal with the following:—(1) No allowance is made for clouds, which of course vary considerably in different parts of the country. (2) The varying values of the angle of incidence of the sun upon the windows is not taken into account. (3) The distance of the obstructive erection from the building owning the easements is not taken into account provided that the angle of obstruction is not increased. The reflective light obtained from such areas is often of immense value. (4) It is a necessary corollary of the author's work that if no sky is visible there will either be no light in a room, or if there be any light it will be of no value. (5) The system is useless for determining the injury to the best light one can obtain—viz., from the north.—I am, &c.,
H. PHILLIPS FLETCHER.

29, New Bridge-street, Ludgate-circus, E.C.

RUTLAND COURT, S.W.

SIR,—In the description of Rutland Court, Knightsbridge, my design for which you are good enough to illustrate in the current number of the BUILDING NEWS, you state that the cost of the work was about £12,000. This is obviously a printer's error, and I shall therefore be obliged if you will allow me to state that the cost was about £120,000.—I am, &c.,

DELISSA JOSEPH, F.R.I.B.A.
Portland House, 73, Basinghall-street, E.C.
August 26.

Intercommunication.

REPLIES.

[11998].—Turkey Houses.—"Poultry Architecture," 100 illustrations, by G. B. Fiske, published 1902, by Orange, Judd, and Co., New York, to be had through B. T. Batsford, High Holborn, W.C., Chapman and Hall, Henrietta-street, W.C., speaking of Ontario house, gives dimensions as 12ft. square, 10ft. high, and 8ft. at the back. Foundations of tamarack planks spiked together, four posts at corners. Sides of fine slabs, 4in. wide, nailed in, apart for light and air; within roof of boards to exclude rain, &c. Wm. Cook, "How to Make Poultry Pay." In 1899 it was published in England at Queen's Head-yard, Borough, S.E., Walden's, St. Mary's Cross, or by E. W. Allen, Ave Maria-lane, E.C. There is a large work by Lewis Wright, "Book of Poultry," published by Cassell and Co., 1893, which mentions a case of a triangular house, of match-boarded or rough slab, with joints covered by caulking pieces. Width on ground 7ft., height 8ft. Shelves with perches over, hinged to walls, nests under and got at by raising shelf. Gives strength for least material and labour, height, floor-space where needed, good slope for rain, the metal gutter or strip of felt over top easily arranged to give free ventilation at every apex. House 12ft. long, 50 fowls (as many as should be kept together); cost £3 to £3 10s. E. Taylor, of Welwyn, Herts., could no doubt fit up a place, if desired.—REGENT'S PARK.

[11998].—Turkey Houses.—Turkeys thrive best on high and dry land, and the sleeping-house should never be enclosed, even in the coldest weather; the houses should have only wide netting in the front. I advise the houses being inclosed on three sides and roofed over, the side next to the south being open. Each house should be sufficient for at least one cock and six hens. With ten hens the eggs are fertile. The birds must be kept free from vermin, and must have flint grit and plenty of pepper.—H. LOVEGROVE.

[11999].—Acoustics.—"Architectural Acoustics," by E. H. Kelly, Buffalo, N.Y., published by himself, I suppose, at 10 dollars, at pp. 66-7, does not approve of wires stretched top of rooms. The wire only stops the one-hundred-and-twentieth part of sound-wave. Wire cloth, with meshes not over 4in. apart, will, in nearly all cases, stop reverberations. Perhaps B. T. Batsford or Chapman and Hall, both London, could procure book, if they do not stock it. Then there is, at 1s. 6d., No. 116, Weale's series, "Acoustics of Public Buildings," by T. R. Smith, 1895. Probably B. T. Batsford stocks this.—REGENT'S PARK.

Mr. W. P. Hartley, J.P., of Aintree, has offered to bear the expense of further enlarging the Primitive Methodist College, Whalley Range, Manchester. The extension will provide accommodation for 40 additional students and cost about £10,000.

Our Office Table.

THREE fresh pictures have just been hung on the walls of the National Gallery in Trafalgar-square, where the works for the isolation of the structure from other buildings have just been completed. Sir William Agnew has presented a portrait of Mrs. Hartley and her child in the character of a "Nymph with the Infant Bacchus," which was at the winter exhibition of the Old Masters at the Royal Academy in 1902. It is placed in Room XVIII. A portrait of an elderly man by Lucas Cranach the elder has been presented by Mr. J. P. Heseltine, one of the trustees. It is hung in Room XV. A picture by Zubaran has been purchased from the collection of the late Louisa Lady Ashburton. It represents a young lady in the character of St. Margaret; the dragon, the emblem of this saint, is seen in the background. It is hung in Room XIV.

Mr. F. W. Ruck, the county surveyor of Kent, has just presented to his county council his annual return, showing the net expenditure upon the roads for the year ended March 31 last to have been £88,413 16s. 5d., or £148-47 per mile on 595m. 3f. 14p., against £92,324 17s. 1d., or £155-07 per mile, the previous year. The gross contract expenditure amounted to £83,865 5s. 11d., or £140-85 per mile; and the county surveyor draws attention to the fact that this is the expenditure exclusively upon maintenance and repairs, and that it compares with £85,846 2s. 2d., or £141-18 per mile the previous year, showing a reduction of £1,980 17s. 3d., equal to £3-33 per mile, although, he adds, "the extension of the use of foreign material has been continued." But it is greatly in excess of the three years 1898-1901, the figures for which are respectively £131, £121 10s., and £128 4s. 5d. per mile. Mr. Ruck further particularises the fact that the expenditure on footpath improvements, amounting £1,892 12s. 2d., was the largest for the five years given, and that other improvements of various kinds cost £3,668 2s. 8d., these sums, together with others beyond that covered by contract, amounting to £11,728 3s. 3d. and being equal to £19-7 per mile. The gross quantity of material used for coating the roads was 95,693 cubic yards, which was a saving of 6,022 cubic yards on the previous year, with a reduction in cost of £1,663. And it is anticipated that a still further reduction will be possible in the current year. The roads of Kent are at the present time, he remarks, with very few exceptions, in a sound condition, and certainly better able to withstand the traffic brought upon them than at any previous date. The comparative tables, however, show the total expenditure to have been higher than in any of the previous years enumerated. It was £96,697 7s. 10d., against £94,874 7s. 10d. in 1901-2, £82,052 19s. 6d. in 1900-1, £75,690 18s. 10d. in 1899-1900, and £83,783 5s. 7d. in 1898-9. Some suggestive tables are given by Mr. Ruck, showing the comparative outlay on various materials required for road maintenance. Thus there were 44,427 yards of quartzite used, costing £39,590, against 46,391 yards, costing £41,300, in 1901-2, and 41,535 yards, costing £36,094, in 1900-1. Scotch and Guernsey granite were employed for the first time, the former to the extent of 946 yards, costing £802, and the latter to the extent of 834 yards, costing £793. There were 32,603 yards of flint utilised, involving a cost of £11,354. The gravel used was 920 yards, and it cost £325. Rock was used to the extent of 2,951 yards, and to the cost of £1,095. The total quantity of material used was thus 95,693 yards, costing £59,161. The cost per yard for the three years was £12-3 in 1902-3, £11-9 in 1901-2, and £11-2 in 1900-1; and the cost per mile was £99-36 in 1902-3, £102-15 in 1901-2, and £90-87 in 1900-1.

THE Report on Wholesale and Retail Prices in the United Kingdom in 1902, demanded by the inquirers into the operation of Free Trade, has just been published as a Parliamentary pamphlet of 454 pages. It contains, in addition to much information as to current prices, a series of 188 statistical tables and charts giving comparisons of wholesale prices extending in one case over a century, and in the others over thirty years. The statistics as to retail prices, here compiled for the first time, are naturally more restricted in scope. A return as to the prices of bricks in the Glasgow district has been specially furnished by the Glasgow Master Brickmakers' Association. It shows that the cost of stocks, ex-carriage, averaged on June 1 25s. per 1,000 in 1902, as

against 27s. 6d. at the corresponding period in 1901, and 30s. in 1899 and 1898; it was 27s. 6d. in 1898, and had stood at 25s. from 1893 to 1897. The maximum and minimum prices during the past forty years were 35s. in 1873 and 21s. in 1881. Slates and slate slabs have, according to the official statistics issued by the Home Office, shown little variation in price during the last twenty years. In 1902 the average value per ton at the quarries was £2-80, against £2-67 in 1901, £2-61 in 1900, and £2-79 in 1899. The figures as to the value of cement extend over sixty years, and are based on the declared values of exports. In 1902 these averaged £1-72 per cwt., against £1-91 in 1901 and £1-87 in 1900. From 1873, when it averaged £3-04, there has been a steady fall in value, the lowest point having been reached in 1894 at £1-62. The declared value of firwood, at per load of 50 cubic feet, was last year £1-37 for hewn and £2-55 for sawn, showing a slight but steady fall in prices since 1898. Forty years ago the values were £3-27 for hewn and £3-08 for sawn, the latter term including in each case split, planed, or dressed wood.

IN the course of a paper read last week before the Municipal and County Engineers and Surveyors, at their Aberdeen Meeting, by Mr. William Dyack, the borough engineer of that city, the author remarked that the most common size of granite setts employed in the streets of Aberdeen are as follows: 4in. cubes, 4in. by 5in. setts, 3 1/2in. by 4in. setts, 3 1/2in. by 6in. setts, 4in. by 6in. setts, and occasionally 3 1/2in. by 7in. setts. The prices per ton delivered in the works in Aberdeen for the respective setts are as follows: 4in. cubes, 29s.; 4in. by 5in. setts, 26s.; 3 1/2in. by 6in. setts, 26s.; 4in. by 6in. setts, 24s.; 3 1/2in. by 7in. setts, 27s. The various sizes of setts above enumerated, when laid in position, occupy the following area in superficial yards—viz., one ton of 4in. cubes will lay 5-239; a ton of 4in. by 5in. setts, 4-472; a ton of 3 1/2in. by 6in. setts, 3-722; a ton of 4in. by 6in. setts, 3-541; and a ton of 3 1/2in. by 7in. setts, 3-250. The actual cost of laying amounts in each case to practically one shilling per superficial yard, according to the class of street to be paved.

THE annual report of Mr. John Price, the city surveyor of Birmingham, states that there were erected during the past twelve months 1,733 premises, scheduled under the following denominations:—Houses and shops, 1,348; business premises, 29; warehouses and shopping, 109; miscellaneous, 40; alterations and additions, 196; churches, 5; chapels, 1; schools, 5. There were 2,252 plans deposited in respect of new buildings, and this total is somewhat low compared with those for the previous years. In 1898 the number of plans deposited was 2,026; 1899, 2,946; 1900, 1,849; 1901-2, 3,506; and 1902-3, 2,252. During the past year nineteen new roads, or parts thereof, of an aggregate length of 2 miles 1 furlong 57 yards, have been declared public highways, whilst the length of streets and roads in the city not at present declared is about 9 1/2 miles. On March 31 last the length of declared highways in the city was 266 miles 5 furlongs 93 yards, the mileage of the various kinds of roadway being as follows:—Macadam, 219 miles; granite, 27 miles; wood, 12 miles; wood and macadam, 3 miles; granite and macadam, 3 1/2 miles. The lighting of the city has been improved by the fixing of 1,109 incandescent burners in 132 important thoroughfares. The number of incandescent burners now in the city is 5,000. With regard to the Rea main sewer, the report adds that the reconstruction and diversion of this conduit from the weir at Nebells to Montague-street was satisfactorily completed in July at a cost of £37,433, the contract having been executed by Messrs. Aston W. Smith and Sons. With regard to the flooding from the Rea main sewer, a thorough investigation has been made of the entire length of this sewer from Montague-street to the city boundary at King's Norton to ascertain whether it was possible to obtain any permanent relief by alterations to existing overflows. The result showed that they were almost inoperative in times of flood. A comprehensive scheme for relieving the congested areas has therefore been prepared, and is now under consideration by the public works committee.

OUR contemporary *Indian Engineering* calls attention to the movement for the standardisation of the dimensions of bricks now in progress in Great Britain, and urges the desirability of adopting for use in India the sizes which are

finally decided upon in the United Kingdom. It is rather difficult, it is remarked, to account for the adoption of the size 10in. by 5in. by 3in. for bricks in India. In other parts of the world, and even at earlier periods in India, a less cumbersome size, such as 9in. by 4 1/2in. by 3in., has been commonly used, and there is much to be said in favour of the lighter weight as against the heavier from the bricklayer's point of view. In India, where the exertion of building with heavy bricks must of necessity be felt more than in colder countries, there is more reason than elsewhere for employing a brick that is conveniently handled, and this consideration will come to be of more consequence as the art of brick-making advances in the direction of machine-moulding, by which denser, and therefore heavier, bricks are produced. From the designer's point of view multiples of 10in. are more inconvenient to work with when reduced to feet than is the case with multiples of 9in.

THE education committee of the Cornwall County Council discussed at great length at their last meeting the proposed appointment of a surveyor for each of the nine educational districts for the purpose of inspecting and reporting on the non-provided schools. Mr. King expressed the opinion that the work was much too difficult for an ordinary surveyor. He advocated that the plan adopted in Plymouth was an exceptionally good one. There a skilled surveyor was brought down from the Midland Counties, and he reported on all the schools. The Earl of Mount Edgcumbe pointed out that the schools had been examined by the surveyor to the Education Department up to last year. Mr. J. C. Williams believed they had no power to compel alterations to voluntary schools. The chairman (Mr. R. G. Rowe) stated that was so, but they could refuse to take over a school, and steps could be taken to erect a provided school. He had had a letter from the Board of Education stating that the education authority would not have power to repair any voluntary school, that duty resting upon the managers. The meeting resolved, on the proposal of Mr. A. Carkeek, to advertise for surveyors for the nine districts, it being stipulated that they must have presented plans which had been approved by the Education Department, the remuneration to be one guinea for each school or group of schools and travelling expenses.

MR. VICE-CONSUL BERNARD BLUNT, in a report on the trade of Uleaborg for 1902, has a suggestive passage on the tar trade:—"Tar, of which between 30,000 and 40,000 barrels are exported yearly, is of the kind known as Stockholm tar, and is made in three qualities, fine, medium, and thick. Three German firms buy as a rule the greater part of the annual shipment, and sell most of the thick tar again through their London agents to the United Kingdom. A good deal of fine tar goes to Holland, but there is generally twice as much thick tar as there is fine and medium together. The merchants here would only be too glad to sell direct if the British would buy; if they did, they would save the German houses' profits, and also the British agents' commission, and also be sure of getting pure Stockholm tar, which they are not certain of doing if they buy tar which has been shipped to Hamburg and warehoused there; Archangel tar is much cheaper, and, if mixed with Stockholm tar, I doubt if anyone could detect its presence. Uleaborg has the largest export of tar after Archangel in Europe; every barrel is examined and filled up directly before being shipped, and a guarantee is given by the tar-yard inspector that the tar is pure, the barrels full, and the quality fine, medium, or thick, as the case may be. It would pay British tar importers to buy direct, and there is no reason why they should not do so."

MEETINGS FOR THE ENSUING WEEK.

MONDAY.—Builders' Benevolent Institution. Committee Meeting. 5 p.m.

TUESDAY.—Institute of Builders. Council Meeting. 4 p.m.

At the last meeting of the Tynemouth Board of Guardians the contract with Messrs. W. A. Fishburn and Co. for the building of a fever hospital pavilion and the rebuilding of a portion of the work-house boundary-wall was cancelled, at the request of the widow and sretics of the late Mr. W. A. Fishburn; and the contract was transferred to Mr. J. C. Dobinson, of Preston, at £4,800 9s. 1d., credit being given to Messrs. Fishburn and Co. for the work already done under the contract.

LIST OF COMPETITIONS OPEN.

Blackpool—New Offices, Sefton-street.....	£15	C. Arthur, 34, Victoria-street, Blackpool.....	Aug. 31
Howden, Yorks—Sewerage Improvement.....	£15	Henry Green, Clerk, R.D.C. Offices, Howden, Yorks.....	Sept. 12

THE BUILDING NEWS

AND ENGINEERING JOURNAL.

VOL. LXXXV.—No. 2539.

FRIDAY, SEPTEMBER 4, 1903.

DESIGN AND SUPERINTENDENCE.

THE two main divisions of architectural practice—Design and Superintendence—have been inseparable functions ever since the profession emerged from the earlier vocation of the master-craftsman. These functions have grown up together. But, as a matter of fact, there is little in common between them. The man who makes a design and prepares drawings may be an expert at his vocation, a thorough artist, and yet not feel himself the right man to supervise the execution of the work. The two duties have been associated because it appears to be right that the designer is the only person to judge of the execution of his own ideas, or their realisation in brick and stone or wood; the practice also is a healthy one, inasmuch as it brings the architect into contact with his work, and as long as he is in touch with the trades he is more likely to remain practical in his design. To separate design from the actual building is to dissociate the motives and aims of the artist and the builder or craftsman, and to produce a spirit of antagonism between them. It will be a bad day for architecture when the union between the artist and the craftsman is broken. For a century or two architecture and allied arts have been estranged in a greater or less degree, but of recent years the estrangement has become much less acute; the artist is now on friendly terms with those who execute his design; each tries to learn something from the other; there is more sympathy in their motives, and both are brought together in the art and technical schools. These influences have been gains. On the other hand, there is just now a tendency among many of the followers of architecture to make it more of a profession independent of the operative part of the vocation, to regard it as a business agency or a purely artistic vocation, just as the claims of business or art are the more pronounced. A large firm may appropriately style themselves the "Architectural Design Supply Association" who would undertake to supply designs and drawings for buildings; another the "Architectural Building Syndicate," which would undertake to carry out any approved design at the lowest market price. Such wholesale businesses would ignore altogether the executive or craftsmanship side of architecture; the art, indeed, would be regarded simply as a business. And yet many of our large private firms in London and the chief provincial towns are really professional concerns of this kind. They try to absorb all the architectural work, no matter of what kind, and go in for surveying and valuation and estate development as well, and also obtain tenders from builders at the lowest rates. In businesses of this kind superintendence is quite a subsidiary matter. The young pupils may be occasionally allowed to go over works in progress for their own benefit and instruction, and a member of the firm may pay an occasional visit to the building, so as to be able to claim the customary 2½ per cent. for superintendence. This commercial business view of the profession is not favourable to the twofold function of the architect. It would confine the profession simply to the design and preparation of drawings at a certain percentage on the cost. By confining the architect's attention to design only, his labour and responsibility would be much reduced—an important point with those who wish to make the business an easier and less

irksome one. A great many successful architects who have a large practice appear to be of this way of thinking, for they practically leave the superintendence of their buildings to clerks of works, and seldom trouble about personally verifying the work or materials employed. No doubt also the desire to increase their commissions has been instrumental. An architect cannot take a large and varied practice and at the same time find it convenient to superintend his buildings properly. It is impossible. The duty of superintendence must devolve on someone else, with a certain loss to the integrity of the design. The result is unfortunate for art. There are many buildings of good design marred by negligent superintendence and bad detail. The complexity of the conditions under which architects work has also tended to limit his work in one direction. The development of specialism is one of the causes. The prevalent opinion is that better work is done by a man confining himself to one branch of the profession. The designer of buildings is generally a good draughtsman, and if he devotes himself to the drawing of plans and elevations, he soon becomes an expert, and may get plenty of this kind of work to do if he confines his attention to it. Yet it is questionable whether the designer who sticks to his drawing-board is so masterful in expedient and detail, or so practical in his drawings, as he who has had some experience in the workshop, and is in the habit of superintending his own buildings. We do not think he can be. The draughtsman who knows little of workshop practice, or the framing of timber roofs, cannot be so resourceful as the man who has seen different kinds of roof actually framed. In stonemasonry and brickwork possible modes of getting over difficulties in jointing or bonding can only be learned from experience on actual building. The experience gained by seeing things actually done widens the mind of the designer; he becomes more practical in avoiding impossible methods, at the same time bolder in making his details conform to actual requirements. Again, the mere draughtsman working in a narrow groove cannot fail in repeating mistakes in construction and detail. He can only learn to discard them by comparing his detail with practical work, and seeing what really can be done. We can only perfect ourselves in design by learning the possibilities of construction and treatment. These are strong reasons for believing that a knowledge of practical work, which superintendence of buildings will enable the architect to obtain, is of great assistance in design, and that an architectural designer or draughtsman so equipped is in a far better position than a man who picks up all his knowledge of detail in an architects' office or a classroom. Artistic draughtsmanship is not identical with architectural designing; the former implies an artistic sense of eye and touch; the latter a knowledge of construction as well as architecture. We may, therefore, affirm generally that the two functions of the architect's work—the designing of buildings and their superintendence—are essentially necessary to the proper performance of the work, and that we cannot separate one from the other without a distinct loss to the profession and to the building.

These remarks are almost called for at a time when there is a desire on the part of some of the younger men in the profession to discount the practical duties of their calling. They entertain a dislike for the manual part of the art, as it involves technical knowledge and tool manipulation, which is rather repugnant to them. And there is a reciprocal feeling of dislike among workmen for any interference with their work from those who prepare drawings without any practical knowledge of the trade; and this reciprocal feeling has made a stronger

cleavage between the two branches of the profession. These two aims are represented in the Academical or Traditional and the New Craftwork schools, which witness to the separation: the intensity with which tradition has been followed has created the opposite school of the New Craftsman. So it will always be. What does the teaching of architecture itself say? That there was always a connection subsisting between the designer and craftsman. They were often the same individual, exercising a dual control over the work. With the profession of to-day there is an inclination to separate these two duties, to make the designing of buildings, the preparation of drawings and specifications, a duty apart from the superintendence which follows. One reason is the marked division between the design on paper and the actual building intrusted to the contractor. The very mode of remunerating the architect favours the distinction. Each part of his work has a percentage assigned to it. It is now a common practice to engage an architect to prepare a design or a scheme for building without any intention of realising it. Competition work is an instance. Drawings and perspectives are made for a building at the invitation of a committee; it may be executed or not, but the execution is not a condition of the contract; it is only the merits of the design that are thought of; the execution may even be intrusted to another. It might be otherwise if the terms of competition were a prize for the best building, or for the ablest builder who had carried out the most satisfactory work, instead of for the best design on paper. So that modern competition has greatly assisted in the cleavage between the two. The only sort of rivalry in the great epochs of art was that between art craftsmen—sculptors, painters, carvers, metal-workers—who strove to vie with each other in the beauty and excellence of their handiwork. It was the actual work that was the object of reward, not the drawing for it. When we apply the same principle to the superintendence of our modern buildings, we shall see at once where it lacks the reality of the old influence. Efficiency of control can only be exercised when the architect supervises the process of execution from the earliest stage in the conversion of material to the final result. To do this he must have access to the workshops of the builder, direct the economical cutting of stone from the block, and the stone dressing, the formation of joints, of various labours on the stone for cornices, copings, stairs, and various other purposes. In the same manner in the carpenter's trade effective superintendence begins at the timber yard, on the selection of proper timber, on its seasoning, on the mode of setting-out and framing roofs and floors, in superintending the proper joints for framing, and the various processes necessary in the construction of floors, roofs, and partitions. Also to the many processes of joinery, which includes under that general title all the finishings of the woodwork of a building, everything which is thickened, planed, and wrought to a smooth face, and framed with a precision and neatness which should render it almost impossible, but for the grain and colour of the wood, to discern the joints of the framing. The ordinary idea of superintendence is to see that the specified kind of fir or deal or oak is used, and that they carry the right thickness, that the workmanship looks fairly good, that there is no sapwood or shrinkage on floor boards or framed work; but these are only superficial signs, and such superintendence cannot reveal the actual jointing which may be concealed, or many other defects which the tricks of the trade disguise. The actual workmanship may be hidden from the architect's view. In the building of stonework in piers and columns, cornices and staircases, how very little is disclosed to his examination. The cores of columns and cornices may be defective without the proper

bonding or "anchorage," and yet they may pass the specification standard superficially, and be in accordance with the dimensions and external section of the details. How can the architect tell whether the pulley stiles of the sash-frames are according to specified thickness, or the outside and inside linings are what they appear to be when the frames are fixed to the openings? An eighth of an inch less would not be recognised; they are allowed to pass. How often, for instance, specified 2in. deal moulded sashes are finished as 1½in., unless great care is exercised, and the floor-boards do not agree with the finished thickness specified? The allowance made for planing has not been taken into account, and the doors and other framings are an eighth of an inch less in thickness than they were intended to be. How, again, is it possible, when a shop cornice is up, to find out how it is put together—whether properly tongued and grooved. With such things as French and other casements, the casual visit to a building cannot satisfy the architect that the water-bars of brass or iron, as specified, are used, and whether the proper weather grooves and rebates are made. These are things which can only be ascertained by frequent visits to the workshop of the joiner. But what does superintendence, as generally understood, imply? It means a periodical visit to the building in progress, where a great deal of the mason's and carpenter and joiner's and others' works are already fixed or in process of fixing, the actual workmanship being done at the builders' shops. The architect sees only, in most cases, the finished work fixed, after it is too late for alteration. His general superintendence takes the form of a walk through the building with the builder or foreman: a superficial inspection of the several trades with reference to the specification requirements; an occasional alteration about some matter of detail which often leads into a charge for "extra"; an alteration here and there. But such is not in any sense superintendence. Those who have given any consideration to the question will have a rather different opinion. One American critic says the superintendent of a building, whether the "architect himself or someone under him, should visit the work," specification in hand, checking off one by one the items in regard to labour and materials which he positively knows by the evidence of his own senses to have been strictly complied with. We should not like to say how many there are in the profession who can assert that they know by the evidence of their own senses how such-and-such a thing has been done. The only way is to watch the process of the work day by day. The same writer gives a few hints which the superintendent of a building may follow, but the advice rather applies to the clerk of works. First, he should be familiar as possible with the plans and other drawings of the building; he must foresee the consequences of each step during construction; he must not trust blindly to the accuracy of the plans, as mistakes in drawing or figuring cannot be avoided; he should compare the work on the ground and bring to the notice of the architect any error in the drawings or figuring which he discovers; he should compare figures with each other, details with general drawings, and facilitate to the utmost the smooth and rapid prosecution of the work committed to his charge; he should also look out beforehand for other points which may affect or hinder the construction. "If, for instance, the drawings show stone and brickwork bonded together in elevation, it should be his duty at once to procure bricks of the kind to be used in the facing, and lay them up with mortar joints of the specified width, in order to ascertain with certainty the height which a given number of courses of bricks will lay. It is common to assume that five courses of bricks will lay 1ft. in height [in this country four courses are taken to the

foot], and the detail drawings for the stonework are figured accordingly. If, then, as often happens, the particular brick used is a little thicker or thinner than the standard, the stone once cut from an incorrect assumption will fail to bond properly, and if it cannot be recut, must either be thrown away or inserted as best it may, the wide joints and irregular lines bearing witness to the incompetency of the director of the work." The superintendent will find many opportunities for saving both contractor and owner from the carelessness of workmen. The inspection of materials delivered, and the rejection and removal from the works of defective materials, are cautions of importance. The building should be visited periodically, and examined throughout at each visit. In this way concealment of bad workmanship or material can be better discovered. These remarks apply to clerks of works even more than to the architect, but they are all to the point. The latter cannot visit the building so frequently as to find out all that has been done during his absence; but he can try by frequent calls at the workshops to keep pace with the processes of the trades, and discover faults before it is too late to rectify them. Mere casual visits and superficial examinations is not superintendence in the true sense of the word. Nor will it do to trust to specifications as if they embodied all that is necessary in construction; there is more that cannot be touched in a formal document, which only prescribes materials and sizes. The detail drawings may also be incorrect, as actual requirements can only be obtained during construction. Too much confidence is also placed in the workman who is paid by a contractor, and does not care to divulge defects, and has an inveterate dislike to pull down or alter work he has already done. A great deal more could be said about the various devices and expedients of building workmen to conceal points that are of the greatest importance; but we may leave a few of these matters to another article.

PROPOSED AMENDMENTS TO THE BUILDING ACT.

THERE are many sections of the London Building Act, 1894, which call for revision and improvement. We have from time to time pointed out a few of the more questionable sections of the Act relating to fire prevention and the safety of occupants. The present sections were framed with the object of partially acceding to the demands which experience had shown to be desirable, of bridging over in a temporary manner the difficulties and inadequacies of the old Act; but they still leave much to be done to render the statutory law simple and direct in its action. Several suggestions have been made. Mr. Bernard Dicksee, district surveyor, in his paper on "Fire-Preventive Sections of the Building Act" prepared for the late International Fire Prevention Congress, deals with the fire sections of the Act and their effect on building in London, and offers a few useful suggestions for the amendment of the law. We may briefly refer to some of these. One of the most far-reaching sections of the present Act is that on the Separation of Buildings (74). The present section (2) provides that in any building over ten squares in area, used in part for trade or manufacture and in part as a dwelling-house, the former portion used for trade, &c., is to be separated from that used as a dwelling-house by walls and floors constructed of fire-resisting materials, together with all passages, staircases, and other means of approach to the latter. The part used for trade or manufacture, if it extend to more than 250,000c.ft., is to be subject to the provisions relating to the cubical extent of buildings of the warehouse class. This section has been often

contested in courts of law, owing to the difficulty of determining the conditions, as in defining the meaning of trade or manufacture and the area; in one case the question turned on the point as to whether premises in which beer was sold came under the section or was exempt from it. It is a most important section, for it prevents a large building over ten squares in area from being used both for trade and as a dwelling-house without due provisions being made for the safety of the occupants in case of fire; yet, as we have pointed out, the statutory area of ten squares is arbitrary, and excludes a large number of buildings which are now used for manufactures of an inflammable kind, and also for tenements which just come below the limit of area. The amended form suggested by Mr. Dicksee is to the following effect:—

"(1) Every building exceeding ten squares in area, and used, or constructed or intended to be used, jointly for the purposes of manufacture or trade (whether wholesale or retail), and for dwelling, shall be structurally divided into a part or parts to be used for the purposes of manufacture or trade and a part or parts to be used for dwellings. (2) The part or parts used for the purpose of manufacture or trade shall be separated from the parts to be used for dwelling by walls and floors constructed of fire-resisting materials, and all such walls shall be at least 4in. in thickness, and if more than 10ft. in height and not built in cement at least 8½in. in thickness." It is also provided that all the openings in such walls and floors are to be closed by doors and frames of fire-resisting material bedded solid to the wall or floor; also the part, or parts, used for dwelling shall have a separate means of approach from street or open space, and all staircases and passages forming the means of approach shall be included within the parts used for dwelling, and be constructed of fire-resisting materials. Practically the present section is recast. Sub-clause 2, which runs: "And all passages, staircases, and other means of approach to the part used as a dwelling-house shall be constructed throughout of fire-resisting materials," is made less obscure, for the amended clause states there shall be provided to the parts used for dwelling a separate means of approach from a street or open space, and the staircase and passages are to be included within the dwelling. In fact, the dwelling is to have its own approaches, staircase, &c. As it now reads, these may partly belong to the part of building used for trade, &c. Mr. Dicksee would substitute for section 74 (1) the following:—" (1) Every building shall be separated from each of the adjoining buildings by external or party-walls, or by party-arches or party-floors. (2) If any building exceeding ten squares in area is divided into two or more tenements, each having a separate entrance and staircase, or a separate entrance from the outer air, every such tenement shall be deemed a separate building, and shall be separated accordingly." These clauses define in a rather more lucid manner than the present section, which runs: "Every building shall be separated either by an external wall or by a party-wall or other proper party-structure from the adjoining building (if any), and from each of the adjoining buildings (if more than one)."

As regards the separation of tenements within a building, the present section provides that in every building exceeding 25 squares in area containing separate sets of chambers or rooms, tenanted or constructed to be tenanted by different persons, the floors and staircase are to be fire-resisting. The amended clause suggested insures that each separate set of dwelling-rooms tenanted, or adapted to be tenanted, in different occupations are to be cut off from each other by fire-resisting walls, partitions, and floors, and from the common staircase or other approach by brick walls. It will be

seen this is a more complete separation than that prescribed in the Act; but these precautions are provided only for buildings exceeding 100,000c.ft. Section 68 is also amended. In fact, each separate dwelling virtually is protected by walls and floors of fire-resisting materials, and the corridors, landings, and stairs of the common staircase approach are to be of the same kind. The amended form also proposes that a building of more than 250,000c.ft. is to be divided by party-walls, no division extending to more than that limit, each to have a separate staircase and entrance, affording a direct means of approach from each set of dwelling-rooms to the street. These clauses will prevent the occupation of any large block of tenements for dwellings without means of approach that is above suspicion. A similar clause now exists (section 75), which provides that no building of the warehouse class shall extend to more than 250,000c.ft. unless divided by party-walls, and no addition is to be made to any building of this class which will extend it beyond this cubic space; but the limit of 100,000c.ft. is now suggested for buildings of this class, the floors of which are not of fire-resisting construction. The suggested clause extends practically the same provision to buildings of the warehouse class. Buildings exceeding 100,000c.ft. containing offices or rooms not used for dwellings, tenanted by different persons, and to those of more than 250,000c.ft., these are to have, in the first instance, floors, staircases, and corridors of fire-resisting materials, and carried on supports of the same kind, and the latter party-walls with separate stairs and entrance, as in the case of dwellings. These latter clauses will apply to all buildings let as offices of the dimensions named.

The rules as to uniting buildings (section 77) are very important, and are intended to prevent buildings in different occupations from being united. The Act says they are not to be united except when they are wholly in one occupation or are adapted to be so, and it goes on to describe the openings in party-walls. Sub-section (b) states such openings shall have the floor jambs and head formed of brick, stone, or iron, and be closed by two wrought iron doors each $\frac{1}{2}$ in. thick on each side of the wall, fitted to rebated frames without woodwork of any kind (or by wrought-iron sliding doors, &c.) The suggested clause inserts after brick, stone, or iron, "or other fire-resisting and non-combustible material, and shall be closed by a pair of party-wall doors at a distance from each other, of the full thickness of the wall." These words will admit other fire-resisting materials than those mentioned being used, such as concrete, uraltite, and other substances; it also speaks of the doors being fitted close to rebated iron frames, and secured by bolts at the top, middle, and bottom of each stile, &c., so as to prevent the risk of warping under the heat and the escape of fire and smoke into the adjoining building. The clause also allows the use of doors of fire-resisting material other than iron. Other details are suggested: one that the Council have power to allow the openings to be constructed not exceeding 9ft. wide. Another clause refers to openings in party or external walls subsequent to existing openings, in which case the subsequent openings are to be made in accordance with the provisions of the Act. For any openings made before the passing of the amended Act, the owner or occupier is to make an application for a certificate as to such openings, stating their size, number of stories, use and area of building. These suggestions are good. One other point is the limit of cubical contents suggested for trade premises. Mr. Dicksee proposes, as we have seen, a limit of 100,000c.ft. for buildings of the warehouse class, the floors of which are not constructed of fire-resisting materials;

but where the floors are so constructed the building or division may extend to the statutory 250,000c.ft. The existing section 75 certainly errs on the side of leniency. The suggestion made as to the protection of metal girders, stanchion columns, and supporting walls and floors by incasing them with concrete, terracotta, or metal lath-and-plaster is a necessary one; also the one condemning wooden boarding or panelling to partitions, walls, or ceilings not of fire-resisting construction; that the spaces between the studs or joists be filled in solid with brick, concrete, or other fire-resisting material, and that no space should be left between such panelling and the wall partitions, &c. There are other suggested clauses to which we may refer another time. There is certainly much to be done to make the present Act conform to our present knowledge of fire-resisting construction, and the best means of fire prevention. The sections as they stand bear witness to the tinkering of old Acts and sections. We ought to have now a code of building rules that are at once comprehensive, simple, and decisive in their operation, applying to every class of building and up to date. Sections 74, 75, 77 are instances of revisions and interpolations of the older Act, which are by no means satisfactory, and are constantly giving rise to disagreements. The importance of limiting the cubical contents of a building in which separate sets of dwelling-rooms exist is too obvious to admit of question. One hundred thousand cubic feet is certainly quite large enough capacity in a building to contain dwelling-rooms in different occupations constructed in the usual manner without fire-resisting partitions, floors, stairs, and approaches. Beyond that cubical limit, they ought to be separated partly vertically by walls and partly horizontally by floors of fire-resisting construction, as in the manner suggested; but beyond the limit of 250,000c.ft., now prescribed for buildings of the warehouse class, the divisions ought to be by party-walls carried up between the sets of dwellings, as a fire is better confined between vertical walls than in spaces limited in part by floors and in part by partitions. The author has obviously considered this necessity in the suggested clauses. In buildings containing sets of offices other than dwelling-rooms a similar arrangement is provided. In both cases it is essential that the common staircase and approaches should be inclosed within brick walls of at least one brick in thickness, and the floors of corridors and passages be also invulnerable to fire. Where such provisions are made compulsory the risks of fire with the attendant loss of lives will be very materially lessened in all our buildings exceeding the limit of 100,000c.ft. A very large proportion of buildings in London are used partly for trade and partly as a dwelling-house, and come within the ten-squares area, or exceed it more or less. The existing law provides for them by walls and floors and approaches of non-combustible character where they exceed ten squares; but a great deal is left to the discretion of the authorities, and as for those which fall within the limit, we have no guarantee at all.

THE ARCHITECTURAL ASSOCIATION.

THE curricula of the Day and Evening Schools of the Architectural Association have just been published. The classes are now held, as for many years past, at 56, Great Marlborough-street; but after Lady Day, 1904, the work of the Association will be carried on at the Royal Architectural Museum in Tufon-street, Westminster, where the necessary alterations are in progress, from plans by Mr. Leonard Stokes, F.R.I.B.A. The Day School will be under the mastership of Mr. H. P. G. Maule, who has been appointed this session in succession to Mr. A. T. Bolton. The winter session will begin on Monday, the 28th inst. The evening schools, at which the lecturers and instructors are Messrs. Cole A. Adams, Henry

Adams, Max Clarke, A. O. Collard, Banister F. Fletcher, P. L. Forbes, J. E. Hulme, H. J. Leaning, W. G. B. Lewis, F. W. Pomeroy, H. B. Ransom, H. A. Satchell, H. Stannus, C. E. Varndell, and A. M. Watson, will also open on the 28th inst.

The following is the syllabus for the ordinary meetings of the Architectural Association, held, as in former years, on alternate Friday evenings at 7.30 (and until March 25, 1904) at the R.I.B.A. room, 9, Conduit-street, W.:—

- Oct. 2. Annual Meeting. Address by the President, Henry T. Hare, and Distribution of Prizes.
- Oct. 16. "The Day School in Relation to Architectural Pupilage," by Arthur T. Bolton and H. P. G. Maule.
- Oct. 28 (Wednesday). *Conversations* at the Royal Institute of Painters in Water Colours. 8 p.m.
- Nov. 6. "Modern Churches," by C. A. Nicholson.
- Nov. 20. "Farm Buildings," by H. M. Cantley.
- Dec. 4. "Photography for Architects," by Members of the Camera and Cycling Club.
- Dec. 13. "Old Stucco and Plaster Work, with Reference to Modern Possibilities," by G. P. Bankart.
- Jan. 8, 1904. "Egyptian Architecture," by Hugh Stannus.
- Jan. 22. "As to the Making of Architects, with Examples of Draughtsmanship," by Maurice B. Adams.
- Feb. 5. "Cottage Homes," by W. A. Harvey.
- Feb. 19. "Corner Houses," by W. Henry White.
- Mar. 4. "Schools," by John W. Simpson.
- Apr. 22. "Craftsmanship," by W. Gilbert.
- May 6. "The Value of Science as an Architectural Curriculum," by A. E. Muaby.
- May 13. Members' Supper.

THE ENGINEERING STANDARDS COMMITTEE.

A REVIEW of the work of the Engineering Standards Committee has been issued by the secretary, Mr. Leslie S. Robertson.

The movement was set on foot in the beginning of 1901, when the five leading technical institutions, the Civil Engineers, Mechanical Engineers, Naval Architects, Iron and Steel Institute, and Electrical Engineers, supplied funds and formed committees in order to introduce into this country a national standardised system, and thus bring British manufacturers into line with their American and German rivals. The work grew enormously, and the Government, recognising its national importance, made a grant of £3,000 towards the expenses, and now the leading manufacturers are also subscribing to the support of the Engineering Standards Committee. No fewer than 27 committees have been at work during the past three years, with 170 members, including 25 representatives of Government departments.

Referring to the committee on bridges and general building construction, presided over by Sir Benjamin Baker, the report says that their labours have been confined principally to drawing up a series of standards so as to meet all the requirements of general building construction, and they have succeeded in making a considerable reduction from the large number formerly in vogue, and some of the leading firms are already adopting them.

In the matter of tramway rails the sub-committee have agreed upon a series of standards which have been approved by the Board of Trade, and have even been rolled abroad; and the report of the sub-committee on railway rails is nearing completion.

The standardising of electrical plant is presided over by Sir William Preece, and four sub-committees have been doing a lot of useful work. The sub-committee on generators, motors, and transformers have been collecting evidence for the determination of standard voltages and frequencies, and also the standard sizes for dynamos and motors. The other electrical committees deal with such subjects as cables and conduits, telegraphs and telephones, and the temperatures of insulating materials.

The Indian Government appointed a conference to discuss the question of standard types of locomotives, and they have referred some of their findings to be dealt with by the Engineering Standards Committee. It is anticipated that great advantage will be gained by the interchangeability of the different parts of locomotives, the object being to enable the British manufacturers to deal with the Indian orders and deliver the material more quickly, an advantage hitherto held by Americans and Germans through their system of standardisation.

The endeavour of the Shipbuilding Committee has been to decide upon a series of sections which would give sufficient graduation and yet not be larger than could possibly be avoided, so as to reduce to a minimum the plant and stock of rolls

to be kept by the steel-makers. This committee has also been discussing the sizes of test pieces for iron and steel material used in the construction of ships and their machinery.

The French Government have sent over a commissioner to study the procedure and the lines upon which the Engineering Standards Committee had been organised.

ON BUILDING TIMBERS.—XXXV.

OAK.

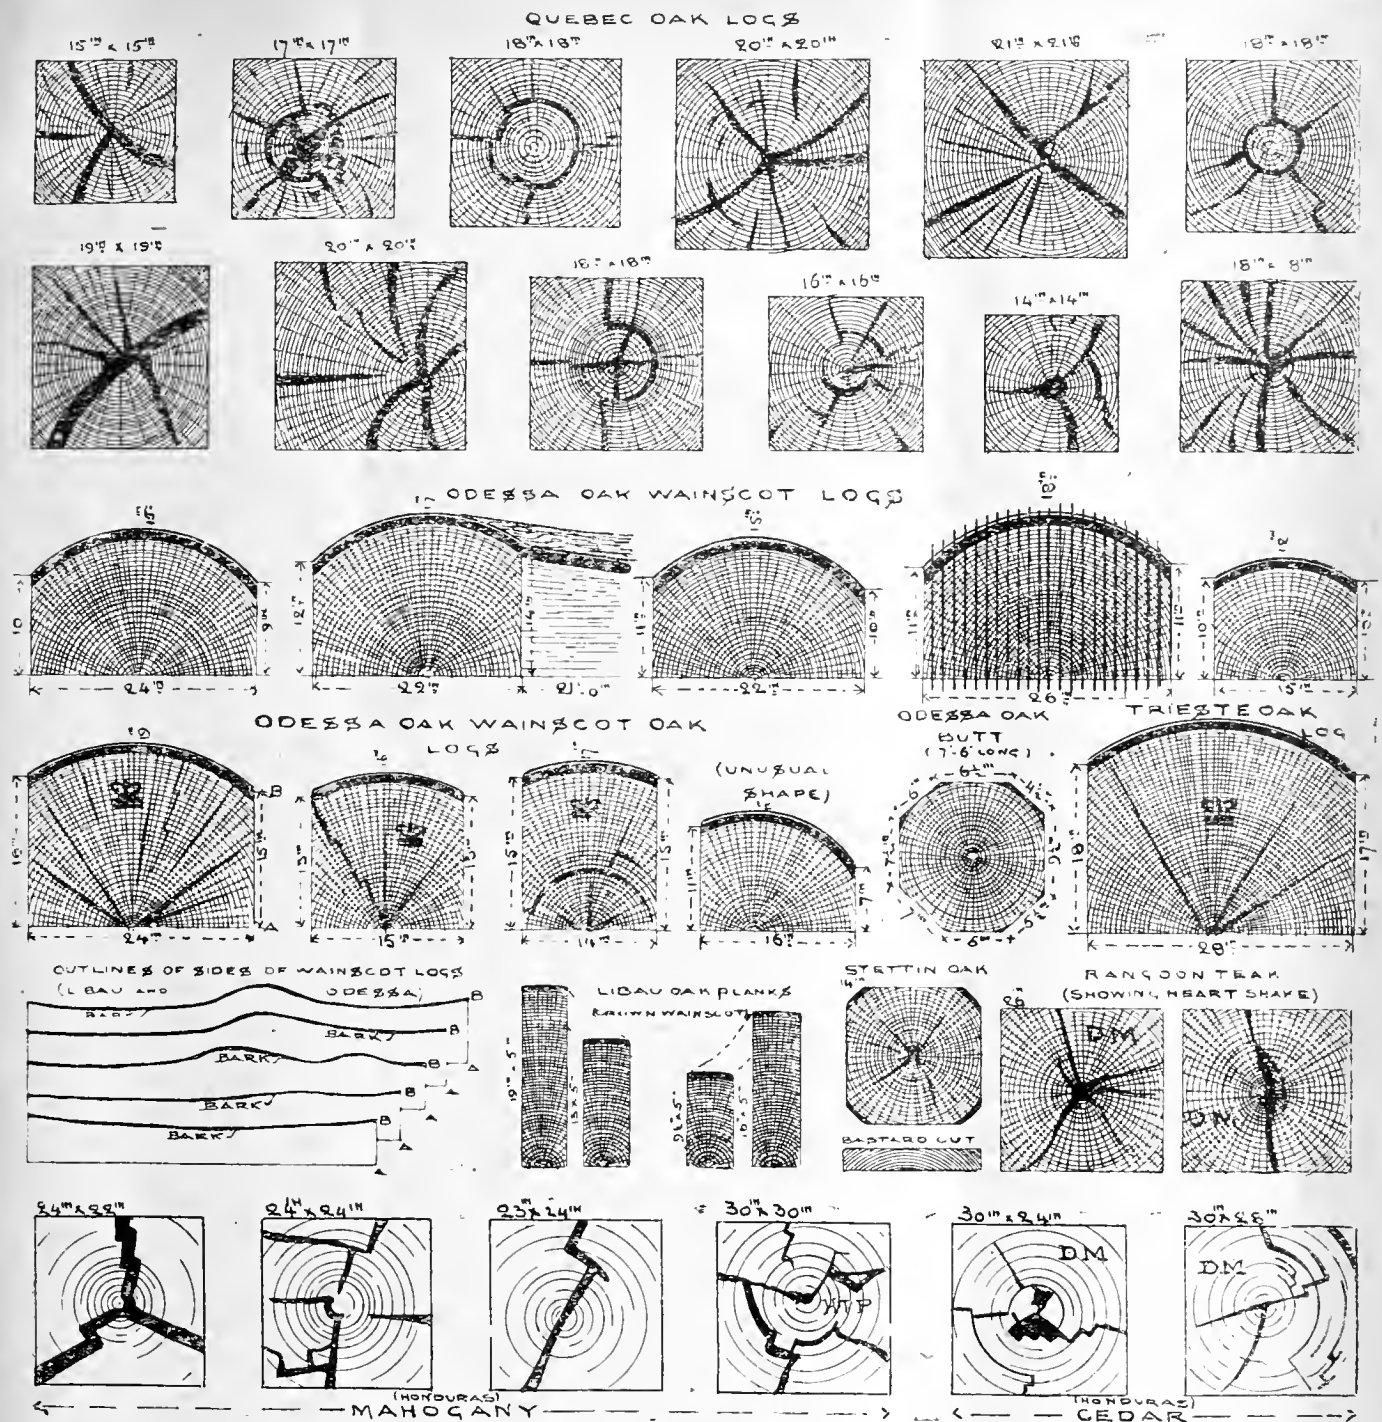

ENGLISH oak was commonly used for tiling-battens in this country, until sawn pine battens, introduced from Norway and Sweden, displaced them. Tiling-battens were called "laths" when oak was used, and the old specifications described laths of three kinds—viz., heart of oak, sap laths, and deal laths: the heart-of-oak laths were used for tiling, the others for plastering. Before plastering laths were imported ready sawn—that is, when they were cleft from lath-wood—some architects applied the old terms in use for oak laths to those split from Baltic lath-wood; hence in some specifications the ludicrous expressions, "heart-of-deal laths" and "sap laths" are sometimes found! The old architects rigidly excluded oak sapwood from all wood cleft into roofing "battens," but their modern successors are content to use pine sapwood for roofing and plastering. Split deal laths were used at one time for ceilings only, and oak sap laths for covering wall studding and partitions. All these laths, as well as the heart-of-oak laths for tiling, were cleft to 1½ in. broad and ½ in. thick. The "statute" (for everything in building was at one time regulated by Act of Parliament) recognised but two sorts of laths—viz., "five-foot laths" (five score to the hundred) and "four-foot laths" (six score to the hundred). These were made up in bundles, a bundle being a "hundred." Though the statute did not acknowledge it, there was another lath made, one 3 ft. long, of which size there were seven score, or 140, of these to the "hundred." It requires no very elaborate calculation to discover that 500 ft. lineal of five-foot laths, 480 ft. of four-foot laths, and 420 ft. of three-foot laths made each one "hundred" or one "bundle." It would naturally be expected that some trade custom would tone down any very rigorous application of mathematics to these laths, and this really was so, for a "bundle of laths" never exactly corresponded to the description in width, thickness, tale, or measure of the pieces composing it. Thirty bundles of five-foot made a "load," thirty-seven and a half of 4 ft., and fifty of 3 ft. The old lath-renders in oak called a radial cut or split the "cleft grain," and a tangential split "felt grain." Oak paling and wainscot panelling were always cleft radially, hence the name "cleft grain"; deal laths are always cleft in the felt grain, from lathwood which, as will be seen hereafter, is now nearly all sapwood. Oak for laths was first cut to the lengths required, then each round log was split with wedges into small pieces called "bolts"; these bolts were again cleft with a "dowl-axe" by the "felt grain" into pieces the width of the laths required, usually 1½ in. This operation was called "felting." Laths were now cleft from these pieces by the "cleft" in "quarter" grain with a tool called a "chit." Forty feet of round oak timber made twenty bundles, or hundred of heart laths, and ten bundles of sap laths. In 1700 the common price for oak lath splitting in Sussex was from 4d. to 6d. per bundle, and the laths, labour, and material cost about 20d. per bundle for heart and 14d. per bundle for sapwood. One hundred years later (1800) lath-rending was worth 1s. per bundle, heart laths sold for 6s. and sap laths for 4s. per bundle. A "carriage" of oak laths was 60 bundles, 40 being heart and 20 sap laths. Oak tile-pins, or pegs, were used to hang plain tiles on oak laths. A peck of pins did about three squares of "healing" with plain tiling, the tiles being 10½ in. by 6½ in. This size was also fixed by statute (17th Edw. cap. 4th). They were laid to a 7 in. gauge, each square taking about 2½ bushels of lime and five bushels of sand in mortar. Shingles were always cleft from oak butts. They were from 9 in. to 12 in. long, and 4 in. or 5 in. wide. When dressed they were 1 in. thick at one end and tapered to not quite ½ in. at the other end. Such shingles were in extensive use for covering church spires which were framed in oak. Shingles are always laid on boarding, that is, the

whole surface to be shingled must first be covered with boarding laid as if on a floor, and to this boarding the shingles are secured by nails, the shingles being arranged so that the gauge shall allow of "three waters," or in plain English, one shingle must overlap that immediately under it for two-thirds its depth, and the second one under it for one-third its depth, reckoning in each case from the head of the shingle. Suppose, for instance, that the shingles are 12 in. long, then each would show 4 in. to the weather, lap 8 in. on that immediately underlying it, and 4 in. on the head of the shingle in the same course below. In this case if the shingle is 5 in. wide, then it covers 20 super. inches of the roof, exactly as much as a slate the same size would cover if laid to the same lap. The lengths of all the shingles in any one horizontal course must be the same—not so the widths: they may vary from 4 in. to 7 in.; but wide shingles are objectionable, for they are liable to split. When shingles of irregular widths are used, the vertical joints will not necessarily come in the centre of the shingles below. They may break "bond" or "joint" as much as 2 in. when the shingles are wide. Shingle roofs are common enough in the States and Canada, though they are not in general use here, probably on account of our damp climate. With us they are sometimes fixed in a church spire instead of lead, when the framework is wood; but in the countries named they are used in ordinary dwelling-houses, and shingle roofs there are as common as tile roofs in this country. About one of the last materials any builder here would think of using for shingles is Yellow Pine (*P. strobus*). Yet that wood is extensively used in Canada and the States for shingle roofs. Cypress and Cedar are also used in the States; but the writer has not come across one American specification which provides for the use of oak shingles, the only material ever used for the purpose in this country.

American shingles are "breasted," or "shaved" and "sawed." The shaved shingles are usually of yellow pine, varying lengths from 18 in. to 24 in., they are ½ in. thick at the butts, and ¼ in. at the "points," and the finished surfaces are as smooth as if planed. The American architects usually specify that the shingles shall be "first-class." Shingles of this quality must answer to this description:—They shall hold the full length specified, the ends shall be square, and the butts of extra thickness (say fir shingles to 2½ in.), the points must be uniform, with no clips, sap (no matter how slight), the smallest knots, shakes, and rot, are all ruled out. Some of the Cedar shingles used in Virginia are 30 in. long, ½ in. thick at the butt, and tapering to ¼ in. at the point. A shingler will, of course, cover a roof faster with big shingles like this than with small ones. The standard width of a shingle is 4 in., and narrower are seldom packed in a bundle. 3 in. are sometimes made, and they are not objected to. A bundle of extra long shingles will contain only 100; one of ordinary lengths will contain 500. The best quality sawed shingles are made of split quartered yellow pine, and they are of various lengths from 12 in. to 18 in. The wood used must be free from defects of any kind; bastard-cut shingles are always rejected, for they are worthless in a roof. The great difficulty in getting faultless wood for shingles has induced manufacturers to put 12 in., 10 in., and 6 in. "clear" qualities on the market; that is, the lengths specified are faultless, but the remainder may be defective in some way; but this is not a matter of much importance, as the defects are not exposed to the weather. When yellow pine shingles are used they are dipped in creosote stain, and as an 18 in. shingle is usually laid 5 in. to the weather, it follows that the bond or lap of the shingles is 6½ in. Two nails are used to an ordinary shingle, and three to a wide one. Cut are better than wire nails, for the latter soon rust; 1,000 shingling nails weigh about 3 lb. A roof to take cedar or cypress shingles may be laid with pine "fencing," 6 in. by 1 in., spaced to suit the shingles. Each course of shingles is "flushed" and "over-flashed" against side walls. The English architect will be startled to read that specifications in the States provide for flashings of tin! The American architect is developing methods of construction peculiar to the States; these are generally the outcome of peculiar requirements, general or local. To build for posterity there, houses must be proof against fire, cyclones, lightning, and earthquakes. We are not much troubled with the three last, but our architects have to reckon on a much more destructive influence on good building than all three

combined—viz., that of the ground landlord. The number of shingles to a square is, of course, determined by the area of the shingle exposed to the weather. This area in inches, divided into 14,400, will give the number required. The number of shingles a man will lay on a roof in a day depends apparently on that man's capacity for lying! For a good day's work of eight hours any number from 2,000 to 10,000 is about the figure, subject to the condition stated. There are men in the States who do nothing but shingling, as we have men who do nothing but lathing (for plasterers), and these specialists can, of course, cover a greater space in the same time than an all-round hand; but that there could be such a difference as that indicated is sheer absurdity. We often hear of the number of bricks "cute Yankees can get Englishmen to lay; but if a few truck-loads of mortar are tipped with a barge-load of bricks, and the work is "bedded and flushed" with a steam-roller, the number of bricks a man can lay in a day is simply astonishing. When shingle-laying and bricklaying are subjects of discussion, shinglers and bricklayers write and talk as if they had taken leave of their senses. The writer once asked a competent bricklayer who was building an arch with bricks, every one of which had to be cut, rubbed, and moulded to templates, how many he could prepare and set in that arch in a day, he replied: "I should consider it a good day's work if I did as many as I could comfortably carry home in my frail." His "frail" was his food basket; and he did not exaggerate, for the amount of work a man will do in the day, whether at shingling or bricklaying, depends on the class of work he is engaged at, how he does it, and the material he has to use. English oak was, and is still, much used for fencing. An oak butt 5 ft. long and 15 in. in diameter can be cleft into 80 pales, and one 21 in. diameter into 130 pales. Good pales are always cleft and cut to straight edges free from sapwood. Oak is sawn into pales so that crooked, knotty, and defective stuff may be used which would not be possible in cleft work. The only part of an oak tree of any use for building is the trunk below the first branches of the crown or head. All the latter stuff is, however, not waste, for it is worked up into hurdles, rough gates, fence rails, gate-posts, and other farm work, the smaller pieces being used for cord-wood. There is a dangerous heresy in the home-grown timber trade which it would be well to expose, as it has a direct bearing on the use of oak in building. It is well known that before oaks are felled it is usual to remove the bark. This peeling, or "tan-fluing," begins in Sussex about the middle of April, and in the Midland counties about the end of that month. The season for stripping the oldest trees is generally over by May-day, but young trees will run through May and June. Now it has been explained in these articles that when sap rises in the trunk of a tree it swells the sapwood and bursts the bark. In this condition the bark is easily stripped; but when the bark grows and knits together again it cannot be removed.

When, therefore, the bark is to be saved it must be stripped when sap is passing through the sapwood, and as the tree is felled afterwards the sap is still in it; now timber merchants say that if an oak tree is felled in the winter months when the bark cannot be stripped the natural sap is out of the tree, and the sapwood in cleft goods made from it is perfectly good for use. This statement is incorrect. Oak sapwood, whether it is felled in the winter or summer, will decay rapidly, and is of no value for building. Architects should therefore condemn all oak sapwood, without giving any consideration to the time when the tree was cut down. The writer has cut down and converted many oaks, and he never found the slightest difference between the durability of the sapwood of winter- and summer-felled trees when both were subjected to the weather after having been seasoned for the same length of time. For strength and durability Sussex oak always ranked highest. That grown in South-West Kent and North-East Hants comes next, and this classification was arrived at after many years' observation in Government dockyards, where oak was almost exclusively used in building war-vessels. An English oak plank 3 in. thick will lose one-third its weight in seasoning after seven months. A fitch 10 in. thick will take over three years to lose weight in the same proportion—that is, supposing both pieces to be stacked green; hence, for all building work, when a tree is felled it

should be cut up at once to the smallest thicknesses required to facilitate its seasoning. When oak is steamed or boiled for twelve hours or more, it seasons much more rapidly than if left in its natural state. The medium height of an English oak is about 60ft., and the extreme height 120ft., the clean stem being in each case about one-half the whole height. Hedge-row trees are never as tall as those grown in groves, but they attain a much greater diameter. The following list of some extra-grown trees standing when English oak timber was in much greater demand for building than it is at present, may be of value as showing the size to which oaks will grow under favourable circumstances. Bedfordshire, Woburn Park, 5ft. 1in.; Berkshire, Windsor Park, 4ft. 9in.; Little Park, 8ft.; Buckinghamshire, Stew, 5ft. 8in.; Cheshire, Buckland Hill, 7ft. 8in.; Cornwall, Mount Edgecumbe, 2ft. 10in., a Spanish chestnut 3ft. 9in., with 30ft. clean stem; Devonshire, Filleigh Castle Hill, 5ft. 1in.; Dorset, Melberry Park, 9ft. 7in., "a curly, surly, knotty old monster, called Billy Wilkins"; Gloucestershire Ashwick, 5ft. 6in.; Hampshire, Strathfieldsay, 3ft. 2in.; Hertfordshire, Coln Green, 5ft. 5in.; Huntingdon, Kimbolton Park, 4ft. 6in.; Kent, Knowl, 8ft. 7in.; Lancashire, Townley, 4ft. 7in.; Middlesex, Southgate, 4ft. 9in.; Northamptonshire, Rock-

ingham, 5ft. 1in.; Nottinghamshire, Welbeck, 5ft. 5in.; Oxfordshire, Blenheim, 5ft., none sound above 3ft. 9in.; Rutland, Burley, 3ft. 10in.; Shropshire, Patshall, 3ft. 2in.; Somersetshire, Hinton St. George, 4ft. 9in.; Suffolk, Bentley, 6ft. 5in.; Sussex, Petworth, 6ft. 5in.; Spanish chestnut, 5ft. 1in.; Warwickshire, Warwick Park, 5ft. 8in.; Wiltshire, Wardour Castle, 7ft. 3in.; Worcestershire, Hagley Park, 6ft. 4in.; and Yorkshire, Studley Park, 6ft. 5in. All the above dimensions are diameters at 4ft. from the ground. An oak growing in Sheffield-place, Sussex, at 70 years old was 3ft. 10in. in diameter, which gives a fair idea of the rate of growth in good soil when a tree stands alone but protected from strong winds. The Spanish chestnut (*Fagus Castanea*) is quite equal to oak for building, but it is not easily transplanted, on account of its tap root, neither is it a forest tree, both of which reasons make the wood scarcer in the market than oak. In Sussex this tree sometimes grows to a diameter of 9ft. and over. The Horse-chestnut, *Aesculus hippocastanum*, grows rapidly: in thirty or thirty-five years it affords splendid shade, and is a highly ornamental tree; the wood is white, and mild to work; it never warps. For building it is of no value whatever, but carvers use it in decorative work. The accompanying sketches show end sections of oak

and other hardwood logs at present imported for building. It will be noticed that the Quebec oak logs are badly shaken. This fault leads to great waste in conversion, especially when small scantlings are required. Shakes are usually classified as "star" or "ring"; many of these logs show both kinds combined. The grading of Quebec oak timber is as follows:—First quality must be free from rot, rotten knots which affect the surrounding wood, ring shakes, and great or large worm holes; small worm holes and shakes allowed according to the judgment of the culler. Second quality is all timber not up to first class, but better than culls. Baltimore sends most oak into the English market. The grading there for sawn timber is "first," "second," and "culls." First quality must be not less than 8in. wide, free from all defects; but sap is not to be considered a defect if it is bright and sound. Second quality not less than 6in. wide, and at 8in. wide may have two standard knots (a standard knot is a sound one, which does not exceed 1½in. in diameter). Defects may increase with the widths, but all pieces must be free from heart, dry rot, dote, and worm-holes. Culls are all grades not up to second quality. Quartered oak is also graded as "first," "second," and "culls." First quality must be 5in. wide and over, clear of all defects; seconds, 4in. wide

and over, at 6in. wide; two standard knots or a little bright sound sapwood will be allowed, but no other defects, and these may increase with the widths. All boards and planks must be bold, the full thickness, have parallel edges, which must be square, and square ends. The standard lengths are 12ft., 14ft., and 16ft., and the standard thicknesses 1in., 1½in., 1¾in., 2in., 2½in., 3in., 4in., and 5in. Worm-holes are the most serious defect in hardwood lumber, and face-cracks reduce it one grade in sorting. Newels are cut square outside the heart to lengths of 4ft. or multiple of 4ft.; on cross section they are cut from 5in. to 10in. The Odessa wainscot-logs show the prevailing forms as sent here; the tree is cut through the heart, and each heart becomes a wainscot-log, when the corners are removed as shown. The outline of the sides of the logs show that in conversion for sashes, doors, or other pricing there must be a considerable amount of waste. Each log is hollow-backed as a rule, and this irregularity cuts to waste, this being greater in the narrower boards at the sides than those cut out of the centre of the log. Austrian oak wainscot logs are generally of much larger size than the Odessa logs. Consequently there is less weight in cutting them up. The wood, too, is mild in working, so that a Trieste oak log is preferred by builders to that imported from any other place. Libau oak planks are shown in four sketches, each pair representing different ends of the same piece. It will be noticed that the planks taper from 6in. to 7in. along the backs, a fault which gives rise to much waste in conversion. Some Honduras mahogany and cedar logs are badly shaken, as shown. The teak logs will be referred to in the next article.

THE PROPOSED FURTHER WIDENING OF EAST STRAND.

THE triangular site acquired by the London County Council on the north side of the Strand, between the churches of St. Mary and St. Clement Danes and bounded by Newcastle-street and the eastern arm of Aldwych, has now been almost cleared of buildings, and increasing interest attaches to the four or five alternative proposals for further widening this section of the Strand. Each scheme is indicated on the vacant land between the island churches by ranges of poles and boards, the boards being painted in different colours to indicate the several modifications of the frontage line proposed. The Improvements Committee of the County Council have announced that they propose after the summer recess to bring up a definite recommendation as regards this frontage. The committee remind members of the Council that the scheme which was finally adopted by the Council was one which embraced certain suggestions made by the Royal Institute of British Architects, slightly modified to make the crescent road (Aldwych) connecting the new main street with the Strand more symmetrical. By this scheme a minimum width of 100ft. was to be provided for the Strand, as well as for the streets leading to Holborn and now named Aldwych and Kingsway. The width of the Strand gradually increased to 160ft. to the east, and also to the west of St. Mary-le-Strand Church, in order to provide a minimum width of 50ft. for the traffic on each side of the church. In the large open space between the eastern end of the crescent site and the western side of St. Clement Danes Church, the Council agreed on March 13, 1900, to allot to the Gladstone Memorial Committee a site for the purpose of the monument proposed to be erected by the memorial committee.

The committee have recently had before them, however, a letter from the Royal Institute of British Architects calling attention to a suggestion by Mr. Hamo Thornycroft, R.A., of considerable amendment of the Council's line for the northern frontage of the Strand between the two churches, with a view (a) to bringing the church of St. Mary-le-Strand into alignment with the centre of the thoroughfare; (b) to making the direction of the thoroughfare aim at the front of the church of St. Clement Danes and not at one corner of it; and (c) to securing for the future a good view of the Courts of Justice to all approaching that building from the Strand on the west. The Royal Institute has stated that although in entire artistic sympathy with Mr. Thornycroft's scheme, it is fully alive to the difficulties, financial and otherwise, in the way of its execution, and the Royal Institute has therefore suggested a modification which it thinks could be carried out with a com-

paratively small sacrifice of pecuniary interest, and would practically secure the advantages of Mr. Thornycroft's scheme. By Mr. Thornycroft's proposal the portion of the Strand between the eastern end of St. Mary-le-Strand Church and Aldwych would be widened to an average width of 150ft.; by the Royal Institute's plan the average width would be about 120ft. The Royal Institute has contended that by carrying out its plan a better view would be afforded of both churches from either end, and also of the Law Courts, and the apparent narrowing of the Strand at the point in question would be obliterated, and that, although the eastern end of the crescent site would not be entirely symmetrical with the western end, this would be observable only on paper, and would not be seen when the actual work was carried out. The Royal Institute has also pointed out that by further widening the Strand in the manner suggested the sharp, awkward corner at the eastern end of the crescent site, as contemplated by the Council's plan, would be avoided.

The committee have also had before them a letter from the Royal Academy of Arts suggesting that the fullest consideration should be given to Mr. Thornycroft's proposal, and a letter from the Further Strand Improvement Committee, forwarding a plan showing an amended line suggested by that committee, the line being somewhat similar to the one originally proposed by Mr. Thornycroft.

The committee add that they were impressed with the importance of the suggestions made by the Royal Institute, and accordingly invited certain of its representatives and also Mr. Thornycroft to meet them on the site in order that they might fully explain their proposals to them, and they have since had before them a plan submitted by the Royal Institute showing definitely the scheme which it now proposes.

A further suggestion was laid before the committee by the Council's superintending architect, by which plan the average width of the Strand would be 115ft. Mr. Thornycroft at his interview with the committee expressed himself as being generally in accord with the proposal now made by the Royal Institute.

If the modification originally suggested by Mr. Thornycroft were carried out, it would necessitate the addition to the public way of the Strand and Aldwych of land which would otherwise be let for building purposes, and is valued by the Council's valuer at £350,000; the loss of recoupment if the Council were to adopt the amendment suggested by the Royal Institute of British Architects, and now accepted by Mr. Thornycroft, is estimated at £70,000; while the loss to the Council if the suggestion made by the Council's superintending architect were adopted is estimated at £59,000.

The final recommendation of the committee and the Council's attitude towards it will be awaited with considerable interest, and examination of the rival proposals on the site suggests that the modified R.I.B.A. scheme would probably prove in the end the most remunerative, as well as most conducive to the amenities of the widened thoroughfare.

THE NEW POST OFFICE, PIETER-MARITZBURG.

THE new General Post and Telegraphic Offices, for which the tender of Messrs. Williams and Bell, at £101,300, has been accepted, are to be erected in Longmarket-street, Pietermaritzburg, on the site between the Victoria Club and Messrs. Randles, Bros., and Hudson's warehouse.

An inspection of the contract plans, says the *Natal Witness*, shows that they are based on a comprehensive study of the composite requirements of modern structures and practical acquaintance with several of the most successfully executed offices in Great Britain and the Colonies. In an extensive basement provision is made for the main cable system and distribution services, allied with storage and linemen accommodation. On the ground floor the public is brought by different entrances into direct and close touch with the post and telegraph offices and savings bank, each of which is so divided as to be practically self-contained, though once within the precincts of the building business with the whole can be despatched without leaving and re-entering from the street. Ready ingress and egress, conspicuous position of posting boxes, privacy of telegraphic and monetary operations, are salient features.

The drawings of the main postal hall, with its floriated columns and arcading reaching to a height of 28ft., and circular counter, exhibit quite a sumptuous apartment. The savings bank has clerical accommodation on the floor above, with facilities for even further extension. The two upper stories are devoted to the administration of the post and telegraph departments and telephone exchange, with most ample public and private staircases, corridor, waiting spaces, and luncheon and cloak rooms. The elevations, which are to be executed entirely in dressed Natal stone, with ornamental features at various points, are based on a somewhat earlier phase of the Renaissance than is generally in vogue, and though in harmony with other Government buildings in the city, thereby present a marked distinctiveness of character. The main façade measures in length 236ft., with returns extending some 100ft. to side carriageways. This, with boldly-carved ends, copper-covered turrets, granite-shafted porticoes, and massively wrought central archway, is certainly of bold and dignified appearance, and when completed will rank not only among the most extensive, but be one of the finest architectural edifices in South Africa.

Mr. William Lucas, F.R.G.S., F.R.V.I.A., whose design was unanimously chosen by a Board of Referees, has been intrusted with the preparation of the drawings and supervision of the work.

RURAL HYGIENE.*

THE third edition of this useful little work contains a series of essays by George Vivian Poore, M.D., F.R.C.P., Professor of Medicine, University College, London, &c. Dr. Poore treats on a variety of subjects. There are chapters on the 'Concentration of Population in Cities, Modern Sanitation, Hygienic Units, The House, Air, Water, Experiences in a Country Town, Water Supply, Burial, and others, in which the author bases his remarks on a varied experience, and upon reliable data. In the chapter, "Concentration of Population in Cities," the author makes some sensible remarks. He says crowds of independent and idle persons settle in towns because they can find a greater variety of methods of killing time, or because there is more civilisation than in the country. But what is civilisation, asks Dr. Poore? A recent anonymous writer (the author of "Behind the Bungalow") speaks of this "half-hatched civilisation of ours, which merely distracts our energies by multiplying our needs, and leaves us no better off than we were before we discovered them." Some useful remarks are made as to "death rates," which are often misleading when applied to seaside resorts and other localities. Certain facts must be taken into consideration—the mobility of the population; for a man who has contracted a fatal disease, say in London, may die at Croydon, Brighton, the Riviera, &c. Estimated death rates are often very erroneous. Thus the last census showed that the estimated population of West Ham was 58,278 in excess of the truth. Many other towns had made similar errors, so that "estimated populations" are unreliable. Correction must also be made for abnormal age distribution. Thus in Central London, as the author remarks, there is a great deficiency of persons at the extreme and vulnerable periods of life, and it is largely made up of selected adults imported from the country, and this helps to keep the death-roll low. "As it is, the high death rate of the centre is diluted by the low death rate of the outskirts, and the healthiness of Hampstead, Lewisham, and other outlying districts conceals the condition of the centre." Identical age periods are the most certain. Dr. Poore disputes the statement that London is the healthiest city in the world, which he regards as fallacious, because, taking the death-rate of children under five from all causes in England, it is seen the highest death-rate among children was in Lancashire, the next highest the county of London, and the lowest was in the county of Dorset. The author examines in detail the child mortality in several London districts. After a comparison of districts, the author shows that to Liverpool belongs the distinction of being the most unwholesome place for little children in the whole country, and the Strand (the very centre of London) comes next. We do not follow the author in all

* Essays on Rural Hygiene. By GEORGE VIVIAN POORE, M.D., F.R.C.P., &c. Third edition. London: Longmans, Green, and Co.

his conclusions. He says "the worst districts in Hampshire are below the average of the whole kingdom in the matter of infant mortality." It may be so with regard to infant mortality: but if we take other statistics of adults, the comparison is not so unfavourable. The remarks on overcrowding are interesting, and full of useful statistics. One table is given which shows that the mortality of London as a whole, taken as 1,000, is 14 or 15 per cent. higher than that of England and Wales. But can we fully rely upon these statements? At any rate, the death rates of many districts of London—Hampstead, Brixton, Streatham, Lewisham, and many East-end districts—have a percentage much below that of England and Wales. That the London fogs and overcrowding raise the death rate will not be disputed; and the author's conclusions on our modern cities, and the rage for tenement houses, model dwellings, and flats cannot be questioned. He instances the public health in Chicago, where the death rate from zymotic causes is considerably more than that in London, owing to the overcrowded buildings on a small area. The modern hotel or block of tenements is pointed to as favouring the worst conditions, where each floor ventilates into the floor above; while the lifts drive the air from one floor to another without renewing it. Many of the unhealthy conditions of London life and overcrowded buildings are dealt with—the difficulty of locomotion, for instance. As the author observes: "The check put upon freedom of locomotion by overcrowding and the time occupied in going from point to point more than counterbalance the shortness of the distance we have to travel, to say nothing of the fact that vertical movement requires twenty times the force of horizontal movement." The defective provisions of the London Building Act and the Model By-laws are criticised, and some good suggestions are made. Our author holds up to condemnation the building societies, and exposes many of their failings, and the hardship inflicted on artisans who start in life with a mortgage round their necks. We have no space left to enter into other topics discussed relating to sanitary subjects and country life. Dr. Poore's experience as a practical hygienist leads him to point out many of the deficiencies of our modern systems of sanitation, the utilisation of sewage, and the productive value of the soil when properly treated. The chapter on "Hygienic Units, the Living Earth, and Circulation of Organic Matter" is worth reading for the light it throws on many questions of rural health and economy.

SUBWAY AND MOTOR ACCIDENTS.

ACCORDING to the precautions made against fire and mishaps in the American subways or tunnels, no sort of catastrophe as that which befell the hapless victims in the Paris Subway could happen. It is stated on the authority of the *Engineering Record* that the precautions against fire in the subway divisions of the New York Rapid Transit Railway are elaborate. A water main runs along the wall, with reels of hose at frequent intervals, which will furnish powerful streams for putting out any fire that may break out. The trains will be made of metal cars, not the wooden type used in Paris, and the insulation of the electrical equipment is very heavy. In short, the engineers of this road are said to have prepared their plans so that such an accident as happened in Paris is improbable. These precautions are absolutely necessary in view of possible accidents. There should certainly be a hose laid on with a supply of water. The cars, too, should be of metal or constructed with some other substance, such as uraltite, to render them incombustible. These two precautions would reinsure the public, and the alarm and panic caused by the appearance of fire and smoke would be avoided. But a mad rush to the exits by a panic-stricken crowd is a possible event which ought to be provided for by well-lighted stairways with landings at intervals and handrails, and lifts of fire-resisting cages. Even the most elaborate equipment has often failed in a panic from some insignificant cause, such as the sudden extinguishing of the lights in the tunnels, which cannot be too well lighted, with a double source of supply—gas as well as electricity.

The hundredth anniversary of the birth of John Ericsson was celebrated in New York by the unveiling of a statue in Battery Park. The statue is the work of John Scott Hartley.

A SAFETY SWINGING SCAFFOLD.

A SAFETY swinging scaffold, designed particularly for use in the facing of high buildings of steel-frame or ferro-concrete construction, which have an outside covering of brick, terra-cotta, or stone, has recently been patented by W. H. Ellis and Company, of Cincinnati, and successfully used by them on the fifteen-story concrete-steel Ingalls Building in Cincinnati, now nearly completed, fully described and illustrated in the *Engineering Record* of May 23 and July 18, 1903. The "Ellis" scaffold consists substantially of a platform in sections, suspended by wire cables from brackets supported by the walls of the building at window openings in an upper story, as indicated in the drawing.

Each pair of cables supporting the platform sections passes over two sheaves in the horizontal member of a bracket, and is held by a clamp inside the building. The platform may be raised or lowered by means of block and tackle attached to the cables, and may be held at any height convenient for the work. The platforms have solid floors, preventing the dropping of materials, and an outside guard-rail, insuring the safety of the men. Preferably the sections are placed to abut, so as to form a continuous staging along a whole side or clear round the building, so that the work may be completely finished to any given level before raising the scaffold. Other advantages of this scaffold besides those indicated are that the sidewalk and the portions of the building below it are not obstructed, and the work below may be left completely finished instead of having putlog holes to be filled afterwards.

COMMISSION HUNTING.

THE *American Architect* tells a tale which points a moral, perhaps not quite without point this side of the water. It seems that recently a certain California town was notified that Mr. Carnegie had consented to make it one of the beneficiaries under his benevolent system of increasing the educational opportunities of his adopted country, whereat there was at once public rejoicing, and a special rubbing of hands on the part of the library trustees. Their exultation was, however, quickly chilled by receiving from a certain architect a long communication, in which he claimed that it was due solely to his unaided personal efforts that this happy result had been achieved, and that consequently he wished the trustees to understand that he considered that he had valid claim upon them for appointment, at the usual full commission, as architect to the proposed new building; and he further generously offered to work over without charge a certain

design prepared by him for the library so as to adapt it to the new selected site and fit it to Mr. Carnegie's gift. In support of his claim he narrated how, finding, in 1902, that the town had no library, he "took the trouble to locate one or two of the library trustees"—entire strangers to him—and suggested that they should approach Mr. Carnegie, but was told that an unavailing attempt had already been made. The architect, however, felt sure that should he prepare a new design and submit it to Mr. Carnegie the prayer would be granted and the town secure its library, and he would prepare such design if it were to be understood that he should be appointed architect to the building at the usual commission. This proposition he now maintains was accepted, and he argues that as Mr. Carnegie had experienced a change of heart it must be because of his efforts, and he consequently calls upon the trustees to make good the promise he received. In support of his contention he offers further proof which on the face of things seems likely to be of questionable worth, for among other things he declares that the design proposed by him "is, or should be, still in your [their] possession," while it seems to us his claim would have been stronger if he could have declared that it was in Mr. Carnegie's possession or had even been seen by that gentleman. The trustees rejoice by saying that in some degree the tale is true, but that in one all-essential particular the claimant is at fault, for they point out that the gentleman named by the architect as having closed the bargain with him was not capable of binding them, since, although now one of the trustees, he was not at that particular time a member of the Board, but was simply one of a certain private committee which at that time was endeavouring to secure, by public subscription, enough money to build the library without Mr. Carnegie's help. Apparently the architect has drawn hasty conclusions from insufficient premises, and must content himself with being one of the architects invited by a properly empowered board of trustees to submit a design in competition with other architects. The moral drawn from this is that when one sets out to "locate" a trustee he should do it with the same scrupulous care he would practise when visiting a land-office. Hares are not the only thing that a hungry man—anxious for a dinner or for a job—should take particular care in catching.

BUILDING SAND.

THERE are three kinds of sand used in building—namely, Pit, River, and Sea Sand, all of which were originally produced by the action of running water on rock of some kind. The process was something like this:—At first large blocks of stone were detached from their beds by river currents, or from cliffs by breakers along some sea coast. These angular blocks were ground against each other until they became rounded boulders, the waste being sand. This grinding action being continuous, the boulders were gradually worn down, and in course of time became shingle, and finally the shingle itself was rolled and ground until the whole became sand. Sand will necessarily be of the same mineralogical character as the rock from which it was derived, the waste of a granite rock being sand with grains of quartz, felspar, and mica; that of a hard limestone rock grains of pure limestone, whilst soft rocks like chalk yield no grains, for constant rolling and attrition in water convert them ultimately into calcareous mud. Nature sometimes reverses this process, converting loose sands into sandstones, and as many such derivative rocks have been worn down and converted into sand it is not possible to say how often or how long the same materials have previously existed as loose sand or as compact sandstone. It is a well-ascertained fact that many beds of the New Red Sandstone are built up with sands the grains of which are spherical, a shape they could only have attained by being windblown in a dry state across some desert, or along a sea-shore. Water-worn quartz sands are never so round in the grain as those produced by a sand-blast. All sandstones and grits—in fact, all non-calcareous sedimentary rocks—are built up with materials originally derived from the breaking up by chemical and mechanical agencies of granitic and schistose rocks, the substances so obtained washed, sorted, and deposited by running water, or held in solution by it form the whole bulk of all our sands and sandstones. Sandstones are sands which have been consolidated by pressure,

and the infiltration of some cementing matter such as silica, lime, or hydrous oxide. The first sandstones were therefore derived from the waste of fire-formed rocks, the succeeding sandstones from the waste of water-formed rocks. Sandstones of the older geological formations, pre-Cambrian and Cambrian, have mineral constituents in such condition as show them to be more directly related to granites than the sands and sandstones of more recent formations. The closer any sand is deposited to the parent rock the more unlike will the grains be in mineral composition and size, and the farther a sand is carried the more perfect will be the sorting of the material in every way. Any mass of even-grained sand carries in itself evidence that it has travelled a long distance from its source, for water transit separates one mineral from another on account of their different specific weights, and coarse fragments from fine by the varying velocities of the current. Water flowing rapidly will bear along with it shingle and fine sand. As the velocity decreases the coarser pebbles will be dropped, then the finer, and last of all the sand itself, for with loss of velocity water loses its transporting power. From what has been said it is evident that sands and shingle were not originally "created" as such, nor were they deposited where they are now found by any other agency than that of running water. It is also clear that whatever may be their position at present, they formed at one time the bottom of a sea, lake, or other large sheet of water. The questions suggested by a visit to any sandpit are—(1) Of what mineral, or minerals, is this sand composed? (2) From what kind of rock was it derived? (3) Where was the parent rock situated? (4) To what geological formation did it belong? (5) How did this sand come here? (6) Is it sharp and angular? (7) and finally (8) Is it clean? The two last questions affect its value for building purposes, the first five do not, and are of interest chiefly to the mineralogist and geologist. From a barge anchored in the Thames men dredge up ballast from the river bed. What is this ballast? On examining it carefully, the constituent fragments are seen to vary in size from fine sand to shingle. The material is easily recognised as being flint, with gains of chalk. The flint is "sharp"—that is, the angles produced by friction are plainly seen, and may be felt. The chalk is rounded, and this is so because flint is hard and chalk is soft. All the material in this ballast is "clean," for it has been deposited in water moving at a sufficiently high velocity to carry away any clay there may have been mixed with it. Flint is a material common to all chalky beds, and it is more abundant in the "Upper Chalk"—that of Norwich and Margate—than it is in the "Lower Chalk"—that of Mersham, Dorking, and Folkestone. Quartz is pure silica (SiO_2), and it is always found crystallised, each crystal being usually a six-sided prism, ending in six-sided pyramids. A cubic foot of quartz weighs exactly 165½ lb., and a cubic yard about two tons. Flint is amorphous silica with traces of lime, alumina, and iron, the three latter substances together not making quite one per cent. of the whole. Flint and quartz are, therefore, practically the same substance, the only difference being that one is found of a shapeless (amorphous) nodule, and the other a shapely crystal built up on the mathematically correct principles which constitute two of the "regular" solids. It is certain that when the calcareous mud (now known as "chalk") was deposited on some ancient sea bottom, the flints now found in layers in that chalk were not in existence. Where, then, did they come from, and how did they get into the chalk? Sea water contains a small quantity of silica in solution. Certain organisms, such as sponges and diatoms, provide themselves with silicious skeletons or coverings, the material for which they obtain from the water, and these organisms when decayed furnish silica for the flints. The strange shape and the minute structure of flints show them to be mineral aggregations which were formed round a nucleus of decaying organic matter. Flints, therefore, grew in the chalk after it was deposited as mud, and they did so by the gradual accretion of silica in an amorphous condition which had previously been held in solution by the sea-water in which the chalk mud was deposited. It is estimated that a little more than one-half the material in the rocks which form what is known as the earth's crust is silica. This peculiar substance, whether crystallised or amorphous, is insoluble in water and all acids except hydrofluoric;

but it may be dissolved in alkalies with great ease. Silica, crystallised as quartz, which is the chief constituent of all sands, grits, and sandstones, may be obtained as a fine powder by heating flint to redness and throwing it into water; the resulting friable substance is easily ground to any degree of fineness required. The broken flints in Thames ballast came from chalk beds through which the river and its tributaries have cut their way. The beds of flint gravels found in the Thames Valley, at some distance it may be from the present river bank, were all derived from great chalk deposits now completely washed away. All sandstones were at one time sand, and they are usually silicious, for the sand was originally derived from the waste of granitic and schistose rocks, as already described, which are richer in quartz. Sands are, however, richer in quartz than any granite, for the latter is composed of quartz and silicates of metals, which latter were removed in solution or as mud by the degrading action of water, leaving only the quartz to form the chief constituent of the sand. A normal granite will contain not more than 75 per cent. of silica, including that of the silicates with the quartz, yet the sand derived from it may contain 100 per cent. of silica as quartz. A sandstone, however, is seldom pure quartz, but it may contain from 75 to 88 per cent. of it, together with lime, magnesia, potash, soda, and iron oxide. A sandstone of pure quartz grains set in a silicious cement would be a "quartzite." Sandstones are frequently ground up for building sand, and this answers well for mortar-making; but it is not an ideally perfect material like pure quartz, for it contains alkaline silicates and iron. If a little coloured quartz sand is treated with hydrochloric acid, the colouring matter, which is iron, will be removed in solution, and transparent crystals remain: hence the gorgeously coloured sands of Alam Bay in the Isle of Wight, the green sand of Surrey, and the red sand of Cheshire are all composed of transparent glassy quartz crystals coated with iron in various stages of oxidation. Even the Carstone of Norfolk, which is a highly ferruginous sandstone, shows rounded grains of quartz, with granules of dark brown iron ore; minute scales of mica and traces of feldspar, thus clearly demonstrating its derivation from granite. The maximum thickness of the stratified rocks in Great Britain is about 72,584 ft. (nearly 14 miles) and in the whole world 177,200 ft. (34 miles). These rocks are all formed out of the wreck of much older deposits of even greater thickness, which must have been disintegrated and washed away. As the proportion of silica in all the stratified rocks is 53 per cent., it follows that there is enough of it in the world to make a hollow globe of quartz 7,900 miles in diameter, with a shell about 15 miles thick. Unlike slates and limestones, sandstones are poor in minerals, for they were necessarily deposited in rough water, and being nearly pure silica, there are no bases left in the sand with which that substance could combine to form new compounds.

The older rocks from the pre-Cambrian up to and including the Triassic all contain sands which have been converted into grits and sandstones, a few minor beds only of loose sand occurring in the latest of these formations. In the Jurassic rocks the first deposit of loose sand occurs which is of sufficient importance to get a distinctive name. Between the Upper Lias Clay and the Inferior Oolite micaceous yellow sands are found interbedded with sandy limestones, the whole attaining a thickness of about 200 ft. They may be studied at Bridport Harbour, where a section is seen in cliffs about 150 ft. high, built up with "Midford" sands, as they are called by geologists, from their having been first studied at a village of that name near Bath. The beds of sandy stone referred to as being found in these sands yield the well-known Ham Hill ferruginous limestone which is quarried near Martock, in Somersetshire. On the same geological horizon sand rock and ferruginous sands, attaining a thickness of over 80 ft., are found in the Midland Counties, where they are known as the Northampton Sands. These yield the well-known Duston stone, a fine fissile sandy limestone, quarried near Northampton, and also certain white sands, which are used for making mortar. Higher up in the Jurassic Rocks ferruginous sands, with calcareous grits and limestones, are found forming the Corallian Beds. Headington Stone, an oolitic freestone, which has a deservedly evil reputation in Oxford as a weather stone, was at one time extensively quarried in these beds. The latest sandy deposits

in the Jurassic Rocks are brown and yellow sands, which underlie the Portland stone, and take the name of Portland Sands from it. They are seen at Swindon and other places. It is rather difficult to determine their exact thickness, for they pass down gradually into the Kimmeridge Clay; but in the Isle of Purbeck they are not less than 200 ft. thick.

Cretaceous rocks overlie the Jurassic last described; the lowest division of these, the Wealden series, contains several important deposits of sand, with loam and fine soft sandstone. The Hastings beds of the Wealden rocks are made up of the Ashdown sand about 400 ft. thick, which is rich in loam, blue clay, lignite, and soft sandstone, and the Tunbridge Wells sand, about 400 ft. thick, made up of soft sandstone, sands, and clay, the latter alone attaining a thickness of close on 100 ft. in some places. The Lower Greensand consists of the Hythe beds, which are sand, sandstones, and limestones, the latter containing grains of quartz in the well-known Kentish Rag. The sands of these beds are dug all over North Hampshire and Mid-Kent; they form the well-known Gibbet Hill, Hindhead, and Leith Hill. A calcareous sandstone found in some of the top beds is called Bargate stone; near Godalming the Bargate stone lies on a buff calcareous sand over 40 ft. thick, and it is dug out of false-bedded sands, about 30 ft. thick. Near Maidstone these beds are Kentish Rag and Hascock only, so that the sands which are so well developed in some places are represented by limestones and sandstones only in others. The Sandgate beds are clays, greenish sands, and black sands, which are found in the cliffs between Sandgate and Hythe. They also occur at Pulborough and Petersfield. The Folkestone beds are sands made up largely of sponges and calcareous limestones. The Reigate, Aylesford, Berstead, and other sands are minor divisions of these beds. In the Midlands the Lower Greensand is represented by the Faringdon (Oxon) iron sands and gravels, the Shotover sands, the Woburn, Potter, and the Leighton Buzzard sands; but in Lincolnshire and Yorkshire the Lower Greensand beds are represented by clays only of various colours. The Upper Greensand beds are greenish grey sands, and the soft sandstones which were extensively used in ecclesiastical buildings of London from the 13th to the 15th centuries, the best-known quarries or galleries being at Mersham and Reigate.

Greenish sands and sandstones of this period crop out from under the chalk rocks in many counties. Not far from Warminster beds of chalk are found in these sands; they are wholly made up of sponge spicules; the chalk is sufficiently hard to be used for road metal. Thanet sands, which include a layer of green-coated flints on which they rest, are seen resting on the chalk in the cliffs at Pegwell Bay, near Ramsgate. They are also found between Herne Bay and Reculver, and at Charlton, near Woolwich, where foundry sands have been dug from them. Overlying the London clay are the pale yellowish grey Bagshot sands, and these, like many other geological deposits, have no constant lithological character over large areas, for pure sands are in these beds represented by nearly pure clays at Poole in Dorset and other places. These clays, like the sands, were derived from the breaking up of granite rocks, having been derived from the felspars in them, which are all aluminium silicates.

The Bagshot sands are the latest important deposit of loose sands reckoned in the solid geology of this country, the most recent being glacial and alluvial deposits of what geologists know as the Quaternary Age, which are found scattered all over the country, occupying no definite position with regard to each other or to the older deposits. Glacial and alluvial beds are sands, gravels, and clays intermixed, the debris of all rocks older than the Glacial period. They include granites, sandstones, and limestones, which have been broken up and transported across the country, "up hill and down dale," by moving ice, for the whole surface of the land was at one time covered by glaciers, which broke into icebergs all round the coast. Ice was, therefore, one of the most potent factors in originating sand; but its action terminated in this country long before our ancestors hunted the lion on Hampstead Heath, or chased the rhinoceros and elephant across the Surrey downs—a lapse of time measured back from us by about 50,000 years.

Sands and sandstones are so intimately related that a general description of one applies equally well to the other. Sandstones, for instance, are

either simple or compound, the simple containing quartz only, and the compound quartz plus some other material, which usually determines the name of the sand. Simple sand is quartz ore or silicious—that is, its constituent mineral is quartz. Compound sands are felspathic, micaceous, calcareous, or ferruginous, as the added grains are feldspar, mica, calcium carbonate, or ferric oxide. The most common impurity found mixed with sand is clay, in which there is a considerable quantity of iron—a mixture common to so many sandstones. Now, from the architect's point of view, this added clay or mud is about the most objectionable accessory substance which could be found in either sand or sandstone. No mortar or concrete made with lime or cement of any kind will set if dirty sand is added to them—in fact, the addition of such a sand irretrievably destroys the best cementing material, and the smallest quantity of clay in a sandstone will render it absolutely worthless as a building stone. As sands are found compact as sandstones, so shingle is frequently found changed into conglomerate, which is really a coarse compound sandstone, with pebbles of quartz, slate, limestone, or other rock imbedded in a matrix of more or less silicious cement. The conglomerate becomes "breccia" when the pebbles are angular, showing that they have not been washed about very much since they left the parent rock. Concrete is an artificial conglomerate made with lime or cement which becomes as hard in a few hours as a natural concrete would in as many centuries. It is fortunate that the most valuable constituent of sand is that one which resists abrasion most, and the least valuable constituents are those which are easiest ground to clay or sand. Quartz grains below $\frac{1}{16}$ in. in diameter will travel over rocks down stream for five miles without being sensibly worn, and grains under $\frac{1}{16}$ in. in diameter will travel over 3,000 miles before they assume the shape of rounded pebbles. Large pieces of flint or quartz are worn down more rapidly than finer grains, for the former are incessantly rolled and ground against each other, whilst the latter remain suspended in water unless it is absolutely still. A naturally formed granite sand which has travelled a great distance will resist abrasion in proportion to the relative hardness of its constituent grains, the quartz remaining angular, the feldspar more or less rounded, and the mica flake worn at the edge. Sharpness or angularity is a prime factor in the efficiency of any sand used for mortar which is to be submitted to transverse stress. It appears, however, from actual experiment that sand with rounded grain makes stronger mortar if it is to be subjected to compression only.

Granite, sandstones, and grits are ground under edge-runners, or broken in steam crushers to make building sand. Typical granite is a holocrystalline mixture of quartz, feldspar, and mica. Consequently, the sand obtained directly from it by artificial means will have the same proportion of these substances as the granite has. Sandstones have been already described: they are ground for sand, and so are the kindred rocks known as grits. As few builders know the difference between sandstones and grits, it may be as well to explain it. Grit is a coarse-grained arenaceous (sandy) rock with angular component fragments, which, though crystalline in structure, are seldom nearly perfect crystals, the whole being set in a highly silicious cement. Sandstone is built up with finer grains than grit; these grains may be crystals or crystalline aggregates of quartz, and they are less completely incorporated with the cementing matrix. Quartz rock differs from a pure sandstone in that it is a metamorphic as well as a derivative rock; it is, in fact, a sandstone which has undergone a peculiar change that destroyed all evidence of its mechanical origin. Sandstones and conglomerates being concrete, more or less fine, the "aggregate" can in each of these be seen imbedded in the cement "matrix"; but there is no trace of this structure in quartz rock, owing to the infiltration of silica at a high temperature in presence of water when the rock existed as a simple sandstone. Crushed quartz rock makes good sand for building. Pit sand should be sharp, gritty, and free from loam and vegetable matter, not too coarse in the grain, and with an admixture of finer particles to partially fill up the spaces between the larger grains. If pit sand is dirty it must be washed in clean fresh water until all traces of loam are removed, and that this has been done may be easily ascertained by rubbing the sand when damp between the fingers, which will not be stained if the sand is clean. River sand is usually free from

loam; but much vegetable matter is frequently brought down and deposited with it: this must be removed by washing. The best possible way to wash sand is in a running stream, the force of which is just enough to remove the mud and very fine sand, leaving the fine grit and coarser particles behind. Sand is sometimes sifted and washed by placing it in a sieve held in a tub of water. A quick horizontal motion from side to side causes the smaller grains to pass through the sieve and fall to the bottom; much dirt is in this way carried down with the sand, so that the process is not to be recommended. It is supposed that the mud remains suspended in the water until it is poured off, and the coarse stuff remaining in the sieve is rejected as being unfit for the work;—as a matter of fact, much of the mud is deposited with the fine sand, rendering it quite unfit for mixing with lime or cement. Sea sand is altogether unfit for building, unless all trace of salt is removed from it; this may be done by constant washing in running clean fresh water. The most convenient way to effect this will be to construct a washing-tank in the ground, about 6 ft. square and 18 in. deep, lined with brick in cement. The sand should be filled into this to a depth of 10 in. or 12 in., and a stream of water turned on it. A brown frothy scum soon rises to the surface. The sand should be constantly stirred. When the water runs off clear, and without having a saline taste, the sand may be removed for use. It is well to bear in mind (1) that the individual grains of sand contain no salt; (2) that the salt merely coats the grains or lies between them, having been deposited there by the evaporation of salt water; (3) that the salt is soluble in water, and may be entirely removed by careful washing; and (4) sea sand so washed is quite as good for building as any pit or river sand of equal fineness and smoothness of grain. Walls are sometimes built with a mortar of lime and unwashed sea sand, the inside plastering being of lime and washed sea or pit sand, and no inconvenience results if damp does not penetrate through such walls from the outside or upwards from the foundations. If either of these things happen, the sea-salt is carried through from the unwashed sand by the damp, and it crystallises in patches on the face of the plaster. A cube foot of sea-water weighs 64 lb., and it contains about $1\frac{1}{2}$ lb. of common salt and nearly another pound of magnesia and calcium salt. Sandhills are sometimes found by the seaside, above and beyond the reach of tides. Sand found in these is fit for use without washing, as rain falling on the sand dunes for perhaps centuries has washed away all trace of the saline matters originally deposited in them.

Eighty years ago the building world was agitated about the frequent use at that time of sea sand in mortar, and advocates for its use maintained that the prejudice entertained by many persons against it was altogether unfounded. Mr. Peto, then a builder in Little Britain, used no other than sea sand in the great hospital he built at North Yarmouth, and innumerable witnesses, including builders, town surveyors, and bricklayers, all testified "in the most solemn manner" to the unexceptional quality of mortar made with sea sand; in fact, one courageous gentleman, Mr. Leggatt, "an eminent surveyor and builder of Brighton," declared "under the most solemn obligation" that he always used sea sand for making mortar in preference to any other, and, furthermore, that when it became necessary to pull down walls built with sea sand it required double the labour to what it did to pull down walls built with mortar made of any other sand. The writer once had a contract to erect an important building at Great Yarmouth, and he, too, was fascinated with the sea sand, but chiefly on account of its cheapness; but he always took these laudatory statements of its paramount value as he did the sand itself, *cum grano salis*. It may be taken as an established fact that with all builders at the seaside sea sand is an essential ingredient in good mortar, and that with all builders inland no sand can equal pit or river sand, whilst that obtained from the seashore is valueless, and should not be used unless a damp house is required to be built! A practical man, writing from Belfast some time ago to a leading building paper, said that the best sand used there was obtained between high and low water on Hollywood Beach. Precaution was taken to "kill" the salt by slaking the lime between thin layers of the sand, the killing process being effected by drying and heat. It need scarcely be

said that neither of these neutralise the salt in any way, and that there is nothing whatever novel or useful in the process.

Sand does not absorb water in any appreciable quantity, its bulk is not diminished or increased by cold or heat, it does not contract in drying; therefore the greater the quantity of sand used in mortar in proportion to lime, the less probability there will be of the mortar shrinking and breaking. The cohesive property of the mortar is, however, improved by the addition of sand, and the volume of the latter in proportion to the lime used is limited rather by this consideration, than by the efficacy of the lime to bind the sand together, as the mortar, whether lime or cement, will work too "short" if too much sand is used. The quality of mortar entirely depends on the purity and sharpness of the sand with which it is made, and the setting properties of the best cement or lime will be, as already pointed out, entirely destroyed by the use of garden mould or dirty sand. Mortars over 500 years old made with loamy sand are found to possess no cementing property whatever, and they run from the hearting of thick walls in streams of dust without any apparent trace of the lime used originally in them. In erecting new walls on the site of old ones, it is usual to work up the old mortar as sand; but this should not be allowed, as in nearly every case the old mortar, through being made with loamy sand, is valueless for the purpose, and will, if mixed with clean sand, only injure it. The use of old mortar has this to recommend it: a much smaller quantity of lime will make it into a working paste than will be required from clean sand. Roadscrappings, from hard roads, are frequently used with lime instead of sand to make mortar; but as the proportion of grit in them is so small, compared with the mud, horse-droppings, and other filth, they do not make good mortar. Scrapings from soft roads are simply mud. Burnt clay, bricks, tiles, and soft stone are frequently broken up and ground to be used instead of sand. These, if free from dust, make a quick and fairly hard-setting mortar; but, unlike sand, they are porous, and consequently will absorb water. Mortar made with them is liable to crack and shrink in drying, and where a waterproof wall is required, they should never be used instead of clean, sharp quartzose sand. Good building sand should be of pure quartz only, with grains of known sizes; for instance, such as will pass through a 30 and be caught on a 40 sieve. It is only by adopting some such specification for a sand that the best results are to be obtained in making mortar. The quantity of lime or cement that must be added to a sand, other things being equal, will depend on the voids in the sand; the finer it is the greater will be the content of the voids, and consequently the larger the amount of cement material required to fill them. The content of the voids in, say, a cube foot may be ascertained by filling a box that size with damp compact sand and adding water from a graduated measure until the vessel will hold no more. The volume of water so added will, of course, represent the exact content of the space between the grains. Fluid measure is converted into cubic contents by allowing for every gallon 277.27 in., for each pint 34.659 in., and for a fluid ounce 2.166 in. There are 6.232 gallons in a cubic foot, and the bushel, which is a favourite measure for cement, lime, and sand, measures 2218.192 cu. in. or 1.283 + cubic feet, holding exactly 80 lb. of water. If 17 pints of water can be poured without overflowing into a measure containing exactly 1 cu. ft. of sand, it is obvious that in the measure there are 1138.8 in. of sand and 589.2 in. of void. It does not follow, however, that if cement and sand or lime and sand are beaten together in these proportions that they will make a cube foot of mortar, for there is always a shrinkage in volume when these materials are tempered or ground together with water. Neglecting fractions, the weight of a cube foot of quartz is 166 lb. If the weight of a cube foot of quartz sand is known, the difference will give the voids. The weight of coarse sand is about 113 lb., medium 103 lb., and fine 98 lb. to the cube foot; the voids in each will, therefore, be coarse 53 in., medium 63 in., and fine 70 in. It is, therefore, necessary, before specifying what proportion of sand is to be used with lime, to ascertain from an average sample of the sand what the voids in it amount to, and proportion the cementing matter accordingly. It is necessary to bear in mind that if sand is washed through a sieve it will be much finer than if passed through it dry, and that the voids in a sand can be reduced con-

siderably by packing, this reduction depending a good deal on the size of the grains. Thames ballast passed through an 8 and caught in a 16 sieve, on being filled into an upright cylindrical vessel took one-twelfth more when well shaken down, and a finer sand which passed through a 32 sieve took one-ninth more when treated in a similar manner. Both these sands shrank considerably in volume when water was added to them, even after being shaken down as described. Fairly coarse sands—those which pass a 20 sieve and are caught in a 40—make the strongest mortar; above a 20 sieve and below a 40 the resulting mortar with lime or cement is perceptibly weaker. In various experiments sand below 40, no matter how fine, showed little difference in value for mortar making, but in all cases the shape and condition of the grains have as much to do with their value as the size.

TESTS OF PORTLAND CEMENT.

IT is well known that the tensile test for Portland cement is not a satisfactory mode of finding its strength, chiefly because it does not measure the resistance to compression, which is the main consideration in practical work. Tensile resistance of cement is rarely required. Many authorities have abandoned this test in favour of cross-breaking, which is more easily made. Then the question of the soundness of cement—one of the chief things necessary—cannot be found by either of the above tests. The German test for soundness is tedious, though simple. It is applied by placing pats of neat cement in damp air for 24 hours, and then keeping some in water and others in air for 28 days. If the pats do not become distorted or darker, the cement is considered sound. But the process takes time, and the cement used is often in an imperfect condition owing to want of seasoning when it is submitted to the test. The hydration of the loosely-combined lime in the cement is necessary before testing. Accelerated tests for soundness have been made in consequence of the tediousness of the old process by cement technologists in America and Germany. The results were very conflicting. A German Society of Portland Cement Manufacturers and the Royal Testing Laboratory were long engaged investigating the subject. The results were published in 1900, but the value of these accelerated tests is denied. Mr. W. Purves Taylor, in a paper on the subject before the American Society for Testing Materials, printed in the *Engineering Record*, deals with the question, and brings it down to date. The author is the director of the Municipal Testing Laboratory of Philadelphia, and his large experience of cements gives his opinions weight. The data on which the author bases his conclusions are very perfect, and he shows that work done with cement branded as unsound by laboratory tests has given good results in practice, and shows not the remotest sign of failure. Mr. Taylor observes, in regard to the boiling test: "Of those cements passing the boiling test but one-half of 1 per cent. gave signs of failure in the normal pat tests, and but 13 per cent. showed a falling-off in strength in a year's time." From a laboratory standpoint this test is valued. Further on, however, he says: "It may often happen that a cement may pass the boiling test well, and yet check and disintegrate in the normal tests, particularly if the cement is slow-setting, high in lime, and the test made soon after the specimen is moulded." In fact, it is open to question whether the boiling test can be safely taken as a test sufficient to reject the cement. We can only refer here to the conclusions of the committee in brief. None of the so-called accelerated tests for constancy of volume is reliable in all cases. All the ten cements which withstood the pat test in the normal system of testing are practically constant in volume, when used in test pieces and cement-wares. "Until it has been possible to discover a test for soundness which is reliable, and can be carried out in a shorter time than the standard test, the 'pat test' of the normal specifications must be retained as decisive." Two years later the Society of German Portland Cement Manufacturers reported, after having made tests for the length of two years, the commissioner came to the conclusion "that none of the so-called accelerated tests, boiling tests, &c., was capable of affording in all cases a quick and reliable judgment in regard to the practical usefulness of the cement." The four years' tests made by Mr. Gary, head of the Royal Testing Laboratory,

Charlottenburg, confirm the results of the two-year tests. The paper is an elaborate one, and is illustrated by photographs of the cement specimens after undergoing the tests.

CEMENT PROFITS.

THREE cement manufacturing undertakings have recently issued their reports for the year to June 30 last, and the following is the record of profits and dividends for the past few years. The concerns in question are Joseph Robinson and Company, Casebourne and Company, and Martin, Earle, and Company, and their position is shown in the following comparison:—

Company.	1902-3.		1901-2.		1900-1.	
	Net Profit	Ord. Div.	Net Profit	Ord. Div.	Net Profit	Ord. Div.
Martin Earle.....	£. 18,179	10	£. 23,595	10	£. 19,785	10
Casebourne & Co.	2,156	5	2,833	7	1,584	4½
Robinson and Co.	2,465	5	3,450	5	1,761	5

These figures show some fluctuations, but though last year's profits are down as compared with the previous term, they are higher than for 1900-1, save in the case of Martin, Earle, and Co., which found it expedient to augment its profit and loss account by transferring £1,000 from reserve. All, however, have been able to pay dividends of a satisfactory nature. Martin Earle has only a small reserve of £1,800, and Casebourne and Co. and Robinson and Co. appear to have nothing put by for contingencies. Business varies in volume in this particular industry, and there is fierce competition.

BUILDING IN FROSTY WEATHER.

MR. GRAHAM, the British Consul-General at Stockholm, in his report, mentions that in winter one hears much about the want of employment for bricklayers and others in the United Kingdom on account of frosty weather. Yet anyone residing in Stockholm during the winter months can see bricklaying carried on in hard frost as an everyday occurrence. The art of building, the Consul-General observes, stands very high in Stockholm, much of the work done being both ornamental and of excellent quality. A few years ago a series of experiments were carried out to decide the lowest temperature at which bricklaying might be effectively carried on. Three different temperatures decided on were 23°, 14°, and 6° Fahr. The bricks and mortar were, as to quality and conditions, such as are commonly used in Stockholm. The walls thus erected during the winter were allowed to stand till the following autumn, when they were torn down and the results noted were, that those built at 23° and 14° were perfectly satisfactory, the mortar being quite hard and sound and had to be scraped from the bricks. Those laid at 6° were not satisfactory; the mortar did not adhere to all the bricks, which lay loosely imbedded in it. These results tend to prove that without any special precaution as to material or labour bricklaying can be carried on in Stockholm at a temperature as low as 14° Fahr., or 15° of frost. Generally, it may be said that the mortar should be made in a room where the temperature is kept well above freezing point. The brick used in Sweden is of a light or porous character, which readily absorbs the moisture from the mortar. Hard pressed or calcined bricks and stonework generally are not suitable for building during frosty weather, but edgings or ornaments, &c., of such material can easily be dealt with by slightly warming them before bringing them into position. This can be done by keeping them a few days in a wooden shed heated by an open coke stove. In some cases it is found advisable to cover in with rough boarding the part of the wall where such stonework is extensive; then a very small coke fire is found sufficient to keep the temperature high enough to prevent any damage to the mortar. But although brick building can thus be carried on safely under any of the temperatures already named this does not apply to plaster or cement work, which should not be done at or below freezing point, unless proper heating arrangements are made. In Stockholm 15 or 20 years ago almost all building was broken off during four or five months every winter; it is now the exception that it is hindered by frost more than a few

days or a few weeks annually. Mr. Graham sums up the matter shortly thus:—(1) The bricks should be porous and perfectly dry, that they may readily absorb the moisture in the mortar; (2) the water, sand, and bricks must all be heated.

CHIPS.

The parishioners of Hornesed, Hertfordshire, have placed a stained-glass window in the parish church, to the memory of the late rector, the Rev. George Smith. The window represents the charge given to St. Peter.

The Building Committee has reported to the Newcastle-on-Tyne Board of Guardians in favour of the entire relighting and heating of the union workhouse at a cost of £15,000, the scheme to include electric lighting and the heating of the house by hot water instead of steam. The proposals are the outcome of a report by the city engineer of Newcastle, Mr. F. J. Elgar.

The northern mun roads in Middlesex are being torn up for the construction of electric tramways. The lines have been laid down at North Finchley, and at Woodberry Down and Tottenham new rails are being laid to take the place of those used by the present horse system. The Board of Trade has sanctioned fifteen and a half miles, and the Light Railway Commissioners a further twenty-six and a half miles, the estimated cost of the forty-two miles being £1,686,255. The Middlesex County Council's whole scheme would have given the county 150 miles of tramways, but the bulk of it was withdrawn or rejected.

The town council of Huddersfield have decided to apply to the Local Government Board for sanction to borrow £7,500 for the purpose of supplying the township of Linthwaite with electrical energy.

In Glasnevin Cemetery, Dublin, a Celtic cross has been unveiled to the memory of the late Dr. Joseph Kenny, who was for many years member of Parliament for Dublin, and subsequently coroner for that city.

Major-General Oliphant, commanding the home district, unveiled on Friday in Tooling parish church of St. Nicholas a memorial, erected by public subscription, to soldiers belonging to the parish who fell in the war. The memorial, which is in the form of a tablet of white marble, is placed between the chancel and the vestry door, near the Aldous window, placed by subscription in memory of the son of Mr. Edward Aldous, rector's warden, who also fell in the war. The memorial has been executed by Messrs. Harry Hems and Sons, of Exeter.

In the case of the application on behalf of Jesse Goldsworthy (trading and described in the receiving order as J. Goldsworthy and Co.), Station-parade, Archway-road, Highgate, N., and Oak Lodge Estate, Archway-road, N., builder, the order of discharge has been suspended for three years, ending Aug. 6, 1905. In that of Henry John Gundry, Dorchester, the discharge is suspended for three years, ending August 5, 1906.

The Board of Management of the Manchester Royal Infirmary decided, on Monday, to devote the sum of £13,078, received from the Queen Victoria Commemoration Fund, to building a portion of the new infirmary as a permanent memorial of the late Queen.

The Hackney Board of Guardians have accepted a tender from Messrs. McCormick and Sons, amounting to £45,987, for the erection of schools at Ongar, Essex, to accommodate 360 of the children now under the charge of the Board. Accommodation will be provided for 300 girls and infants in six blocks to house 40 each, and the remaining 60 in cottages, where they will be trained for domestic service, the whole institution being in charge of a matron.

On Monday next there will be laid at Prudhoe-on-Tyne the foundation-stones for a new parochial hall, to be erected on a site given by the Duke of Northumberland, and estimated to be worth about £1,500. Messrs. Watson and Son, of Branch Ead, Stockfield, has secured the contract for the work, and the architect is Mr. S. D. Robins.

Mr. James Pierce Butt, timber merchant, of 21, Park Dale, Wolverhampton, died on Monday, after three months' illness, at the age of fifty-five years. The deceased, who was a native of Gloucester, had resided at Wolverhampton for about thirty years. He leaves two sons and two daughters.

In extinguishing a serious fire on Sunday morning at Messrs. Maple and Co.'s workshops, near Tottenham Court-road, the brigade was just in time to save a quantity of furniture which was in process of manufacture for the King.

The workhouse infirmary, Blackburn, is being warmed and ventilated by means of Shorland's patent Manchester stoves with descending smoke flues, the same being supplied by Messrs. E. H. Shorland and Brother, of Manchester.

OBITUARY.

Mr. HERBERT FORD, F.R.I.B.A. (of Messrs. Ford and Hesketh, Aldermanbury, E.C.), died on Tuesday last, after only five days' illness, at his residence, Homeleigh, South-row, Blackheath, aged 70 years. Mr. Ford, who joined the Institute as a Fellow in 1870, had for many years carried on an extensive practice, chiefly in offices, warehouses, hotels, and other commercial buildings in the City. The funeral will take place to-morrow (Saturday) at 2.30 p.m. at Charlton Cemetery.

EARLY on Saturday morning Mr. JOHN PONTON, of Warminster, a well-known local builder and contractor, was found dead at the bottom of the stairs of his house in Emwell-street, with his neck broken. It is surmised that deceased, who was 70 years of age, had gone to bed, and getting up in the night, had fallen down stairs. It was only last week that deceased had secured the contract for the building of a parish-hall at St. John's Church, and he had recently built the new Warminster county secondary day-school. He succeeded his father in the business, in which he was assisted by his son. The inquest was held on Saturday night by Mr. F. T. Sylvester, the coroner. Evidence was given by Dr. Willcox, and a verdict in accordance with the medical evidence was returned.

Mr. ARTHUR S. CUTLER, city architect of Lowell, Mass., was drowned at Stratford, New Hampshire, a few days ago. His family had been spending the summer at Stratford, and he was amusing himself by rowing on the lake, when, as is supposed, he was seized with faintness, or with some affection of the heart, and fell overboard. He was an expert swimmer, and could hardly have failed to make his way to the shore if he had been conscious at the time of the accident.

Mr. HENRY ALLEN DARROW, one of the pioneer architects of Omaha, Nebraska, died there a week ago. Mr. Darrow settled in Omaha in 1877, when the city was little more than a frontier settlement, and designed many of the principal structures which its growth has rendered necessary.

Mr. AUGUSTUS F. LASH, a person very well known to architects and builders, of Boston, Mass., died a fortnight since, at the age of eighty-two. Mr. Lash was the first man in Boston to undertake on a large scale the removal of old buildings. This has now become an important industry, employing many hands; but it was a novel business sixty years ago, and Mr. Lash and his partner long enjoyed a practical monopoly of it. During his business career he is said to have removed more than 3,000 buildings, among which were many of historical interest, such as the Wendell Phillips house on Essex-street, the Stackpole house on Devonshire-street, the Commercial Coffee House on Washington-street, and "Marm Dunlap's Store" on Theatre-alley, now a part of Devonshire-street, all in Boston.

Efforts are being made to induce the King to visit Liverpool next April and lay the foundation-stone of the proposed cathedral. The Diocesan committee, which have £175,000 in hand, are striving to increase that sum to £200,000, which is the limit they have decided upon before the stone is laid.

The new gateway at Sunderland, which has been constructed by the River Wear Commission, from the River Wear to the South Docks, was opened on Tuesday. The work is part of the great scheme of dock improvement which the commissioners inaugurated some few years ago. The gateway has cost about £36,000, and it gives a depth of water on the sill of 30ft., and is 70ft. in width, widening to 120ft.

Personal estate of the net value of £66,406 17s. has been left by Mr. James William Brooker, the elder, of Elm Bank, Vine-road, Sevenoaks, and formerly of 13, Railway-approach, Southwark, architect and surveyor. The gross value of the estate is £114,245 14s. 8d. The executrix and executors of Mr. Brooker's will are his widow, Mrs. Fanny Brooker, and his sons, Mr. James William Brooker, architect, and Mr. Frederick George Brooker, surveyor, and the testator bequeaths to Mrs. Brooker £250, a life annuity of £500, and the use and enjoyment of his house in Hitchin Hatch-lane, Sevenoaks. He leaves to his son James William two houses in St. German's-road, Forest Hill, a house at Sydenham, and land in Bevington-road, Beckenham; and to his son Frederick George the house in Hitchin Hatch-lane, subject to Mrs. Brooker's occupation thereof, and Durban House, Richmond, and the house adjoining and land there. Mr. Brooker leaves the ultimate residue of his property in trust for his children.

Building Intelligence.

BALMORAL CASTLE.—During the summer alterations have been in progress at Balmoral Castle, not of any structural importance, but having to do more with the internal economy and efficient working of the domestic side of the establishment. The architect is Sir Rowand Anderson, LL.D., of Edinburgh. Last year certain antiquated kitchen arrangements were dealt with, and a new installation of hot-water pipes to the bathrooms, &c., was introduced. This year the accommodation for female servants, which has been somewhat inadequate, has been remodelled and extended by enlarging the wing of the Castle set apart for their use. Hitherto it was two stories in height, now it is three; thereby seven large rooms have been added to those already existing, and the whole provide accommodation for over twenty female servants. Formerly the servants' rooms overlooked the garden; but in the reconstruction of the wing the rooms on all floors have been placed to overlook an open court, while the corridor giving admission to the rooms has been set on the garden side. Storerooms, bathrooms, and other modern sanitary requirements have also been introduced into this wing. Like the Castle, the new work is in grey granite, and its architectural features consist of dormer windows and massive chimney-heads. In the pediment of each dormer there is an ornamental sculptured design. That in the centre has the Royal monogram "E.R.," and the date 1903; another shows the Scottish lion inclosed in a tressure; a third a crown with the rose, thistle, and shamrock around it. Another internal alteration has been the introduction into the Castle of a luggage and coal lift, which hitherto it has not possessed. Nothing has been done to the Royal apartments or to the guest-chambers, which remain as they were in the time of the late Queen; but the Royal entrance hall has internally been considerably improved in appearance. Formerly the walls were of plain wood; now they have been panelled with the native Scottish pine grown in the Royal forest. The panelling extends to the top of the doors, and the space between it and the cornice has been left for stags' heads. Fronting the entrance is a large niche, where for many years stood a statue of Malcolm Canmore. This has been removed to the ballroom, and in its stead has been placed upon a suitable pedestal an early bust in white marble of her late Majesty, which formerly stood on a simple bracket on one of the side walls. On a panel below the pedestal has been carved "Victoria, 1819-1901," and on a similar panel over it appears the Royal monogram "E.R.," with the date 1903. An overmantel, executed in Scots pine, has been constructed over the fireplace, and in the centre is a square panel, on which has been carved a fine representation of the Royal Arms, copied from the Great Seal of Scotland, with the Scottish lion in the first and fourth quarter.

BIRMINGHAM.—At the University buildings at Bournbrook now in course of erection from plans by Messrs. Aston Webb, R.A., and Ingress Bell, the electrical power station is well advanced. Several engines and dynamos are in place, but the cables are not yet put down. In the boiler-house is to be seen a Babcock and Wilcox boiler and a locomotive boiler, and also a gas-fired superheater to give the steam additional heat after it has left the boilers, and thus obtain more work from it. Moreover, the superheater insures that the steam is delivered to the engine in a perfectly dry condition, and there is therefore no danger of water accumulating in the steam pipes. The first experiments upon the use of superheated steam, made soon after the advent of the marine steam-engine, led engineers to abandon the uses of this economical method of working, but after many years it is again coming into practice. The reason is that the materials of which the various parts of the steam-engine are made have altered considerably. The part of the engine which used to give such trouble with superheated steam was the packing round the piston-rod, which, in the early days, was made of hemp. It is now made of metal, various alloys being recommended by various makers. In all of the newly-designed electrical stations arrangements are made for using superheated steam, and in some of the older ones a saving of 20 per cent. in the coal bill has followed the fixing of the necessary apparatus.

CHERTSEY.—The chancel of Trinity Church, Botley and Lyne, has just been enriched by the

erection of a very handsome reredos, executed in Caen stone. It contains a sculptured representation of the Last Supper in high relief under elaborate canopies, flanked by four niches containing statuettes of the Four Evangelists, with their appropriate emblems; while the wings contain panels with the Ten Commandments. The style of the architecture is that of Early English, in keeping with that of the church. The floor of the Sanctuary is covered by richly-coloured inlaid marbles. There is also a new altar rail executed in oak. The sculptor was Mr. Forsyth, of London.

EDINBURGH.—During the summer vacation now drawing to a close less than usual has been found necessary in the way of structural alterations on the schools under Edinburgh School Board. For the most part the work has consisted of the annual cleaning and painting, and of the division of a number of large class-rooms into two, in order to meet the views of the Education Department that classes should be smaller. The only school in which extensive alterations are being carried on is Leith Walk School, to which another story is being added and the electric light introduced. Good progress is being made with the construction of the Boroughmuir and Broughton Second-Grade schools, the masonry of which has now reached the first-floor level. The plans of the new school in Albion-road are now before the Dean of Guild Court, and in the event of their being approved operations will be begun about a month hence.

GLASGOW CORPORATION HOUSING SCHEME.—A special committee of Glasgow Town Council has recommended that the ground, extending to over 6,000 square yards, situated on the west side of Alexandra Park, and acquired from the Parks Department four years ago for the erection of dwellings for the poorest classes, should now be utilised for that purpose. The committee, however, are of opinion that the restriction against one-apartment houses should be waived. The city engineer has accordingly prepared plans for the erection of 180 houses, 84 of which will be of one apartment, with rents of £6 5s. and under. Approval of the city engineer's proposal has been given by the special committee, and the council will be asked to proceed with the erection of the houses, on the understanding that, when erected, they will be let exclusively to persons of the poorest classes who may be displaced by the Corporation from existing unhealthy dwellings within the city, or others of that class, and, in either case, only to such tenants as are in receipt of weekly earnings of a limited amount.

LEITH.—The sub-committee of Leith Town Council on Cheap Working Class Dwellings has had under consideration a report on the subject by Mr. George Simpson, the town architect. The proposal is that two sides of the triangular area presently laid out as a garden and recreation space at Henderson-street improvement area should be utilised for the erection of these dwellings. The plans are arranged so as to provide for eight blocks towards Henderson-street of single apartment dwelling-houses. Thirty houses are provided on each flat, two washhouses, and twelve w.c.'s, entering from two common stairs, and in the event of the buildings being erected according to the plans, if three stories high, there would be 90 houses, six washhouses, and 36 w.c.'s, and if four stories high, there will be 120 houses, eight washhouses, and 48 w.c.'s. Towards Henderson Gardens the plans provide for the erection of four blocks of two-apartment houses. The plans provide for eight houses per flat, one washing-house, and six w.c.'s. If the buildings are erected three stories in height, there will be 24 houses, three washing-houses, and 18 w.c.'s; and if four stories high, 32 houses, four washing-houses, and 24 w.c.'s. The approximate cost, at 5½d. per cubic foot, of three-story and four-story blocks, is given as follows:—Three-story blocks—eight blocks, containing 90 single-roomed houses, £7,100; four blocks containing 24 two-roomed houses, £2,700—say, £10,000. Four-story blocks—eight blocks, containing 120 single-roomed houses, £9,950; four blocks, containing 32 two-roomed houses, £3,850—say, £14,000. The revenue would be for a three-story block, if fully occupied, about £3 2s. per cent. on the capital expenditure, or apart from sinking fund about four per cent., and for a four-story block about £3 6s. 8d.

HORWOOD, HEYWOOD.—The foundation stone of St. John's Church, Hopwood, Heywood, was laid by Lady Beatrice Kemp on Saturday. It

will occupy the site of a dilapidated church, and some additional ground, and will be erected from plans prepared by Mr. F. P. Oakley, A.R.I.B.A., of Manchester. The section to be erected under the present contract consists of nave and aisles up to and including the permanent chancel arch. The chancel now to be constructed is temporary only, though of good size, and built of brick, and will be replaced with a permanent structure as soon as funds allow. The church is to be faced externally with Yorkshire parpoints, with windows, copings, and other details of Sleathwaite stone. Inside, the piers of the nave and part of the arches will be of stone. The arches generally will be of red brick, and the wall's elsewhere plastered. The roof will be covered with slates. Owing to the irregular site, it was necessary to adopt an unusual type of ground plan. The nave and chancel are in line with one another along the greatest length of the site. This leaves room for a wide aisle on the north side only, that on the south side being a mere narrow passage. Arches of corresponding height to those on the arcade between the nave and the aisle form part of the south wall, and contain the clerestory windows in their upper part. The organ will be placed on a raised floor in the south transept with space for seating below. This space will for the present be used as a temporary vestry. When the church is completed the east end of the north aisle will be arranged as a morning chapel. A dwarf wall and three steps will separate the chancel from the nave, and the choir and clergy vestries will be on the north side of the chancel. The complete church will be 110ft. long and 52ft. wide inside, and will afford accommodation for 480 persons. Messrs. Blakeley and Wild, of Hopwood, are the contractors.

NEWCASTLE-ON-TYNE.—The Palace Theatre in the Haymarket was reopened on Monday after redecoration and extensive structural alterations. The scheme has been carried out from the designs of Mr. J. Walton Taylor, F.R.I.B.A., St. John-street, Newcastle, and it has been superintended by Mr. P. R. Donall, from the architect's office. In the main entrance from the Haymarket the new stairs are of marble, the dadoes are of panelled mahogany, the embossed paper harmonises with the decorative fibrous plaster design on the ceiling, a feature of which is the finely-painted panel in the centre. Clusters of electric lights have been provided. In the spacious vestibule the same scheme of decoration is carried out—heavy mahogany paneling, fibrous ceilings with painted panels, a decorated pay-office, mirrors, gold-inlaid cornices, and heavy carpets. The paintings in the ceiling panels represent the Muses, and have been carried out by Mr. Miller. The stairs and passages to the circle have been similarly treated. The interior of the theatre has been entirely redecorated and refurnished. The general scheme of colours is cream and gold. Additional stalls have been provided. The gallery has been rearranged and furnished with another exit. Ventilation has been improved by a new electric fan, and fresh fire hydrants have been fitted. The constructional work and mahogany fittings have been done by Mr. F. J. Hepple, Dunn-street, Newcastle; the ornamental copper grills by Messrs. Hardman, Powell, and Co., of Birmingham; the brass and copper handrail in entrance, marble stairs, and fire hydrants by Messrs. Emley and Sons, Ltd.

ROTHWELL, NORTHANTS.—The fine parish church, dedicated to the Holy Trinity, is now undergoing restoration, and some interesting discoveries have been made in the course of the work. The bulk of the church is Transitional, and there is reason to suspect it was once cruciform, with transepts; but these have long since vanished, possibly as a result of the restoration which gave the church its Perpendicular features. The tower stands at the west end; it suffered much from 18th-century restorers, but a fine transitional west doorway still remains. During the work now in progress a double piscina has been brought to light in the south aisle, possibly a relic of a chantry chapel which may have occupied what is now the south aisle; and the chancel contains a triple piscina, of which there is said to be only one other example in this country. The canopy of this last has long been wanting, but a crocketed canopy with a three-fold head, which is probably the missing one, has been lately brought to light. Some of the clerestory windows which have been blocked up will be reopened.

SALFORD.—The Fire Brigade is removing this

week from the inadequate premises in Ford-street to a new home in Albion-place, opposite the Technical Schools. The new building has been planned by Mr. Henry Kirkley, of Manchester, and embodies the results of a wide investigation of the fire stations of the larger towns of England, Ireland, and Scotland, carried out by the Fire Brigade Committee, assisted by Mr. Bentley, the chief officer of the brigade. The building faces north and south, the front portion directly overlooking the Crescent. The central block contains the main engine-house, a duty-room, call-room, and a tower 52ft. high for drying the hose after use. Adjoining this block is a dwelling for the use of the chief officer. To the right of the engine-house block, but separated from it by the main entrance, are a workshop, smithy, loose-box, stabling, and a spare machine-house, whilst on the left side, and behind the chief officer's quarters, is the drying-room, as well as another machine-house. Behind the front block and flanking the exercising grounds are two rows of cottages for married firemen, each of which contains three rooms, three bedrooms, and a scullery and bath. Room has also been left for an additional block of four similar dwellings. The main engine-room is 69ft. long, 35ft. wide, and 16ft. high, and will accommodate five five machines, whilst the stalls in the stables are directly behind the engine. The electric call-room and duty-room, which are separated only by a glass partition, are on the right of the engine-room, and allow of supervision from the chief officer's room. This last is an office 14ft. by 13ft., and communicates directly with the engine-room and also with the chief officer's dwelling. On the first floor over the engine-room is a parade and instruction-room, as well as the single men's quarters. Over the duty and call-room are recreation-room, lavatories, and bathroom. A novel feature in the station is a horse-bath. It is found that valuable horses are often lost after severe exertion because they catch a chill. This bath, which can be heated to any degree, will, it is hoped, prevent.

SHOTLEY.—St. John's Parish Church, at Shotley Field, Northumberland, after having undergone extensive alterations, was reopened by Mr. Lloyd, Bishop of Newcastle, on Monday. The chancel has been lengthened, and is now terminated by a pentagonal apse, containing five single-lighted windows. The organ-chamber has been built on the north side of the nave, with the vestry behind. The old vestry has been removed, as well as the entrance lobby containing the font, and the space added to the sacred edifice.

WYMONDHAM.—Good progress is being made with the restoration of the great monastic and parish church of Wymondham, one of the finest edifices in Norfolk. The church and a few outlying fragments of masonry are the only remains of the Benedictine Priory founded in 1107 by William d'Albini; but much of the existing fabric dates from 1432-5, when the present clerestory and magnificent oak roof over the nave were built, and the north aisle was widened. The work of restoration was commenced nearly two years ago, the architects being the late Mr. W. S. Hicks and his partner, Mr. W. S. Charlewood, of Newcastle-on-Tyne. The contractors were Messrs. Ruttee and Kett, of Cambridge. About £15,000 has been raised for the work, of which £12,500 was given by Mr. Willett, of Brighton, and another £10,000 is required for its completion. The beautiful roofs will be repaired, the lead being recast and relaid, and every piece of the old carved and other timbers retained as far as possible. All the floors of the church will be relaid at their original levels, the walls and windows repaired, the large west windows in the west tower and north aisle reopened, the seating improved, and proper lighting and warming apparatus provided. The east wall of the nave, which is at present entirely blank, being shut off by a brick wall from the ruined octagonal central tower, transepts, and chancel, will be beautified by the addition of a reredos of stone surmounted by a fresco. Below the sanctuary there will be carved oak choir and clergy stalls, and also a chancel organ. The arch dividing the west tower from the nave will be opened up by the removal of the modern gallery and partition. The organ, presented in 1793, must be rebuilt and enlarged, and will then be placed on a screen under the west tower under a new vaulted groined ceiling (the original corner fan-shaped springers being still in existence). The choir vestry will be built on old foundations, and a clergy vestry built in the base of the eastern or abbey tower, to preserve

the ancient north and south doorways, as well as the doors from the sanctuary, which were bricked up, and will be reopened. There are five bells in the west tower, but they have not been rung within the memory of man owing to their unsafe condition. The tenor weighs 25cwt., and is of fine tone, the second bell is cracked, and must be recast. The remaining bells are also out of repair, the frame is decayed, and the ringing tackle has ceased to exist. Mr. Crosier Bailey and his brothers have undertaken to restore this old peal to life, and to give three new bells, thus adding another complete peal of eight to those already existing in Norfolk. This work is being executed by Messrs. G. Day and Son, of Eye, and Messrs. Mears and Stainbank, of London. Entirely new floors and steps in the west tower are necessary. The ground around the church will be lowered. The architect's report divided the work into sections. The work which has been accomplished up to the present includes the restoration of the roofs, and the windows, walls, and floors of the nave and south aisle, the west end of the church has been opened out, whilst the eastern, or abbey tower, has been preserved. Moreover, on September 30 the dedication of the new bells will take place.

CHIPS.

The formal opening of the new Bo'ness Academy, which has been constituted a higher-grade school, took place on Tuesday. The Academy occupies a commanding site immediately to the east of the Bo'ness Public School. Accommodation is provided for 360 scholars. All the classrooms open from a large central hall intended for physical exercises and the teaching of free arm drawing. One of the classrooms is fitted up as a science-room and chemical laboratory. The cost, including the furnishings, was about £7,000. The architect is Mr. Alexander Callier, of Hamilton, whose plan was chosen in competition.

The attention of the War Office has been called to an architectural disfigurement of Hampton Court Palace by the reconstruction of chimney-stacks on the barrack buildings with yellow bricks, which do not harmonise with the Palace brickwork.

The Duchess of Albany has consented to lay the memorial-stone of the Royal Waterloo Hospital for Children and Women, which is being rebuilt on an extended site at the corner of Waterloo and York roads, S.E., on Thursday.

The committee of the Dean Howell Welsh National Memorial Fund have decided, after consultation with public men throughout Wales, that the form of memorial which would have most warmly commended themselves to the late dean would have been:—(1) The restoration of the roofless chapel of St. Nicholas, in the cathedral church of St. David's, where his remains are interred; (2) the foundation of a David Howell theological scholarship. For the restoration of the chapel at least £1,500 will be required.

The opening of St. Paul's new Congregational Church, Wigan, took place on Friday. The new church, which is Early English in style, and has a spire, occupies the site of the old structure in Standishgate, with extensions in the rear. It provides accommodation for 750 persons, and the cost amounts to about £6,000, the architect being Mr. F. W. Dixon, of Manchester, and the contractors Messrs. J. Wilson and Sons, of Wigan.

The new Kincardineshire isolation joint hospital, which has been built near the railway station at Stonehaven at a cost of about £8,000, was formally opened on Saturday by Sir Alexander Baird, Bart., Lord Lieutenant of the county.

Colonel W. R. Slacke, R.E., held a Local Government Board inquiry at Hull on Wednesday, Thursday, Friday, and Saturday in last week respecting an application made by the Hull Corporation for power to borrow £47,350 for establishing a municipal telephone system in Hull and district.

Mr. W. W. Stevenson, of Bermondsey, a guardian of the St. Olave's Poor Law Union and the secretary of the United Builders' Labourers' Union, has been selected to contest South Hackney at the next Parliamentary contest in the labour interest.

At the Guildhall, Grantham, on Tuesday, an inquiry was held by Mr. J. Stewart, R.E., one of the Local Government Board inspectors, relative to the application of the Grantham Corporation for powers to borrow £3,800 for the purpose of purchasing land adjoining the river Witham on the Belton-lane, and the erection thereon of a refuse destructor and steam disinfecter.

The Local Government Board has sanctioned an additional loan of £21,000 to the Morecambe Urban District Council, for the purposes of sewerage and sewage-disposal.

Our Illustrations.

WESTERN DISTRICT HOSPITAL, GLASGOW.

This building is in course of completion at Oakbank, in the western district of the City of Glasgow, and forms part of the new scheme of hospital accommodation presently being provided by the parish council. The hospital is planned for 205 patients, made up as follows:—Receiving block, 6; medical block, 112; surgical block, 50; maternity block, 37; total, 205. Owing to the restricted width of the site, the problem of placing the several blocks on the ground, so as to meet the requirements of the Local Government Board, presented considerable difficulties, and the plan shows how these have been overcome. The walls are built of brick, having a 2½ in. air space between the outer and inner facing. The floors throughout are of fireproof, consisting of steel joists and fireclay tubes; the flooring of wards being of maple, waxed and polished, and the passages paved with terrazzo. The walls and ceilings are plastered with Keene's cement, all the angles, both internal and external, being rounded. The walls of the sanitary annexes are lined with white glazed tiles, and the floors of bathrooms are paved with indiarubber interlocking tiles. The hospital is lighted by electricity, and the hoists are worked by electric motors. The wards are heated partly by heating elements in the basement, where the air is washed and then driven into the several wards by electric fans, and partly by radiators placed in the wards directly over the air inlets, so that the temperature of each room could be regulated. The foul air is extracted by means of special outlet shafts constructed alongside the smoke flues. Throughout, the hospital is being equipped in the most approved manner, and it is intended that the institution will be ready for opening by the end of the present year. The architect is Mr. Alex. Cullen.

ST. JAMES'S CHURCH AND VICARAGE, CARDIFF.

Our illustration shows the first design submitted for the church and vicarage by the architect, Mr. E. M. Bruce Vaughan; but the committee adopted an Early English design, which has been erected at a cost of £10,000, which has been carried out under Mr. Bruce Vaughan's superintendence.

HOUSE AT NEAR CROSS, STAFFORD.

This small house has recently been erected at Near Cross, Staffordshire, for Mr. C. F. Jenkin, by Mr. Henry Lovatt, of Wolverhampton, from the designs of Mr. C. Stanley Peach, 28, Victoria-street, Westminster. It contains, on the ground floor, one large room 30ft. by 20ft., a drawing-room and a laboratory, each 22ft. by 14ft., and a schoolroom 18ft. by 14ft., and the usual offices. On the first floor are eight bedrooms, and in the roof are two good-sized attics. The windows to

the south front are shielded by shutters and a verandah. The walls are rough-cast throughout, with the exception of a plinth faced with 2½ in. red bricks. The roof is tiled. The perspective drawing is by Mr. S. D. Adshead.

NEW INLAND REVENUE OFFICES, READING.

This building has been erected at the corner of Friar-street and Station-road, Reading. The major part of it has been taken by H.M. Government for the purpose of Inland Revenue Offices. The materials used are local bricks, Portland stone dressings, cornice, &c., and American green slates. Messrs. Wheeler Bros., of Reading, were the contractors for the block. The architects are Messrs. E. B. Hoare and M. Wheeler, of 11A, Orchard-street, Portman-square, and Reading.

ROYAL PRINCES' PARADE PAVILION, BRIDLINGTON.

The Corporation of Bridlington propose extending the Princes' Parade northwards and erecting thereon a new pavilion to accommodate about 2,000 persons. The building is octagonal, and has a raised gallery internally on the western side facing the sea. It is inclosed all round. Three sides are glazed, and there are four entrances, each provided with swing doors. The roof is largely constructed of wrought iron with rough plate glass, and in the centre of the roof there is a large dome 57ft. by 45ft., constructed of wrought iron principles resting upon an octagonal lattice girder supported by a cast iron column having ornamental cap, the dome being surmounted by an octagon lantern light prepared for ventilation. An open verandah, 6ft. wide, with glass roof runs round three sides of the pavilion, and the floor of the pavilion is laid (where not appropriated by raised gallery) with wood-block paving, and contains a raised platform capable of holding forty musicians. On the north side of the pavilion are four bijou shops, and on the south side provision is made for one bijou shop and a refreshment-room 35ft. by 31ft., with kitchen and lavatories for assistants. The roof over refreshment-room and shop is flat, formed with concrete and Val de Travers asphalt, so that it can be utilised for refreshments, and is approached from the refreshment-room by a staircase. Messrs. Mangnall and Littlewoods are the architects.

NURSES' HOME, NORTH STAFFORDSHIRE INFIRMARY, STOKE-ON-TRENT, STAFFORDSHIRE.

The drawings which we publish of the above were those placed first by the assessor, Mr. H. R. Price, of Manchester. Thirty-eight sets of drawings were submitted in open competition, and Mr. R. Stephen Ayling, F.R.I.B.A., and Mr. A. R. Piercy were the successful competitors. The foundation-stone was laid by the Rt. Hon. the Earl of Dartmouth, R.W.P.G.M. of Staffordshire on Oct. 24, 1902, with full Masonic ceremonial, and the building is now nearing completion. It contains accommodation for 52 nurses and sisters, with large sitting-rooms, library, servants' rooms, sickrooms, &c. The necessary funds were obtained by subscription, H.M. the King heading the list with a donation of £105. Local contractors were invited to compete for the work, and the lowest tender was received from Mr. John Bagnall, of Fenton, at the sum of £5,407, in whose hands the contract has been placed. A covered way is proposed from the present infirmary to the new home. Among the sub-contractors are:—Fireproof floors, Messrs. Mark Fawcett and Co. The materials generally are local red bricks, with Hollington stone dressings and red-tiled roofs.

GERMAN OLD FURNITURE.

There is not much to say about these capital pieces of old furniture, chiefly of the 16th or early 17th century date. We are enabled to illustrate them through the courtesy of Mr. Wm. Flockhart. The originals are preserved in the Louvre at Paris.

The members of Colwyn Bay Urban District Council have received from the Local Government Board sanction to purchase the Glan Abet and Rhianfa property as a site for a town-hall and public offices.

The foundation stones of a new Wesleyan Chapel, which is to be erected at Kirton Holme, Lincolnshire, were laid on Thursday in last week. Mr. W. Hinson, of Stamford, is the architect, and Mr. Baker, of Moulton Chapel, the builder, and the cost is estimated at £600. The building will be 39ft. by 29ft., the internal fittings and seating will be pitch-pine, and there will be accommodation for 165 adults.

COMPETITIONS.

HARROGATE.—A new pump-room for the old sulphur spring is about to be erected at Harrogate, at the end of the Valley Gardens, facing the present pump-room, on the site of Rose Villa. The corporation are intending to erect an iron-and-glass building, limiting the scheme to proposals by east-iron trading firms, so that architects will not be invited to submit designs. The excuse for this shortsighted method of proceeding is due to the obvious necessity of not excavating much beyond the surface for foundations in case the course of the springs should be injured or interfered with. The town is singularly devoid of buildings of architectural distinction, and it is a matter of regret that this opportunity of adding to the dignity of this eminently prosperous watering-place has not been made the most of, by erecting a stone pump-room, instead of running up a floric glass-and-iron shelter of the usual manufacturers' type of stock patterns. It would have been perfectly easy to carry a substantial structure in masonry on a raft of iron and concrete, without tampering with the subsoil or its springs; but the authorities, taking their own view of the matter, have decided on the course indicated. We cannot contemplate the result with any degree of satisfaction.

STONE, STAFFS.—The board of guardians have invited Mr. T. H. Fleeming, architect, of Wolverhampton, to act as assessor for the competition of local architects for adding vagrant wards to the workhouse, of which we gave particulars last week.

CHIPS.

Memorial stones of a new Wesleyan chapel were laid at Belfot on Thursday in last week. Mr. Greenfield is the architect.

Messrs. Wm. Potts and Sons, clock manufacturers, Leeds and Newcastle-on-Tyne, have just erected a new Cambridge-quarter chime clock at Ballincollig parish church, Ireland, showing the time upon four large illuminated dials, with all Lord Grimthorpe's latest improvements inserted. They are also erecting one at Keighley parish church, Yorkshire, for Mr. Joseph Greenwood, Keighley, on Lord Grimthorpe's designs and plans.

The new St. Mary's Episcopal Church at Kirriemuir is about to be erected, replacing an edifice in which the congregation worshipped for over a century, and which was destroyed by fire early last year. Plans for the new church have been prepared by Messrs. Bucknall and Comper, architects, Westminster, and will involve an expenditure of £3,000. Of this sum £1,540 has already been obtained by subscriptions and grants from the Walker Trust.

The Wetherby Rural District Council have decided to apply to the Local Government Board for a loan of £4,000, for the drainage of Bramham.

The urban district council of Rothwell, Northamptonshire, have appointed Mr. T. C. Betts, assistant to the late officer, to the position of surveyor and inspector of nuisances in succession to Mr. W. T. Pearson.

Mr. Wm. Brooke, of 11 Hill Top House, Lightcliffe, near Brighouse, the manager of the Non-Ship Stone Works in that village, was killed on the railway line near Lightcliffe station on Friday. The deceased, who was 38 years of age, leaves a widow and a young family.

A Local Government Board inquiry was held at the Sessions House, Dartford, on Thursday in last week into the application of the joint hospital Committee of the urban and rural councils for sanction to borrow £7,748 for the extension of the infectious hospital. Originally, the estimated cost of the work was £7,000, but the requirements of the Local Government Board had increased it to £11,150. The Board has already sanctioned the borrowing of the sum of £3,402, that being the cost of the land and the erection of a boundary wall, and the difference between that amount and the total estimated cost was the subject of the application.

On the site of the mansion in which John Bright was born, the Technical Education Committee of Rochdale are about to build a new school for 400 children and 200 infants.

Mr. H. J. Reay, road surveyor under the rural district council for Brampton, Cumberland, has just been appointed divisional surveyor under the Hertfordshire County Council for the Hertford district.

The will of Mr. William Joseph Thompson, aged seventy-nine, of Clark House-road, Sheffield, engineer, lately engaged on the widening of the Midland Railway and formerly on the Leeds Waterworks, has been proved for £60,355.

Engineering Notes.

WIDENING WORKS AT EASTON.—By permission of Mr. E. H. Thornhill, the chief engineer, the members of the Civil and Mechanical Engineers' Society inspected on Saturday afternoon the widening works which have been undertaken by the London and North-Western Railway Company near Easton. Good progress has been made with the scheme, which was commenced two years ago. The ground, upon which hundreds of workmen are now engaged, was at one time covered by row on row of poor-class dwellings. All these have had to be bought up and new homes found for the tenants—no easy matter in so congested a district as that between Easton and Camden Town. Three thoroughfares have disappeared—namely, Mornington-street, Stanhope-street, and Serpentine-road. The aim of the new works is to provide accommodation for housing and shunting passenger coaches close to Easton. Near Mornington-crescent a large space has been cleared, and when the necessary excavations have been finished, sheds are to be erected in which there will be space for 350 coaches, while there will be room for more on the sidings near by. These sheds will be reached by a subway which is being driven under the main line. In addition, a tunnel is being constructed through which engines can be run out towards Chalk Farm. These operations cover an area of about 5,000 square yards, and have necessitated 450,000 cubic yards of excavation. All this earth is taken out by truck to Willesden, where it is being formed into a bank, on which a goods siding will be made. Masonry retaining walls have to be built round the space for the carriage sheds and sidings, to support roads and property in the vicinity. It is expected that all will be completed by the end of next year. The contractors are Messrs Joseph T. Firbank (Limited).

GOSFORTH AND PONTELAND LIGHT RAILWAY.—Good progress is being made with the light railway some seven miles in length from Gosforth to the village of Ponteland, by the North-Eastern Railway Company. The contractors are Messrs. W. and J. Lant, of Newcastle. The line branches off westwards from the Blyth and Tyne section of the North-Eastern Railway at Gosforth Colliery Junction, and at Cooledge passes under the turnpike road by a girder bridge of 30ft. span and 30ft. in width. There are intermediate stations at Cooledge, Fawdon, and Callerton. The line will be a single one.

RUNCORN.—A transporter bridge is being constructed across the Mersey between Widnes and Runcorn, from plans by Mr. John J. Webster, M.Inst.C.E. The bridge is in design similar to an ordinary stiffened suspension bridge, with the exception that the approaches to the bridge are at a low level—thus dispensing with the very costly high-level approaches—and the traffic, both foot and wheel, is carried over in a car suspended to the underside of the bridge. The arm is 55ft. by 24ft. wide, and can convey at each journey four two-horse waggons and 300 passengers. The twin towers on either shore are constructed of steel, and rise 190ft. above high water level, and are bolted to the cast-iron cylinders below, which in turn are secured to the solid rock. The two main cables each consist of 19 steel ropes bound together, each rope being 12in. in diameter, and built up of 127 wires. The clear span is 1,000ft. The total cost will be £130,000. Mr. L. H. Chase is the resident engineer. The construction of the steel cables was let to the St. Helens Cable Company. The whole of the electric installation and equipment, including the lighting of the structure, is being carried out by Messrs. Mather and Platt, of Salford Ironworks, Manchester.

THE CHESTER AND HOLYHEAD LINE WIDENING.—The London and North-Western Railway Co. are making good progress with their scheme for widening their Chester and Holyhead line between Chester and Llandudno Junction. The first section of the duplication of the railway is virtually completed. This includes the widening of the line from Chester General Station by the Roodeo to Saltney Junction with the Great Western Railway—a heavy piece of work, involving much deep rock cutting and the widening of the Dee Bridge. From Saltney the line is quadrupled to a point about half-way between Queen's Ferry and Connah's Quay. Though some work is in progress in between, the line is not quadrupled again until about half-way between Bagillt and Holywell, whence it is com-

pleted to Abergele. There is heavy bridge work over the Foryd at Rhyl, and a new station at the latter place. A new station has been made at Talacre, on the line between Mostyn and Prestatyn, the first point where the line nears the sea after leaving the estuary of the Dee. Some of the stations have an extra island platform, whilst others have through running lines in the middle of them. The next portion of the widening is to begin at the west end of the tunnel at Llysfaen—that is, Old Colwyn station—and the track is already fenced off in places on the land side. Work of an important kind has been begun at Colwyn Bay station. The old ballast pit, which is such an eyesore to the town, is being converted into a goods yard and goods station, and the approaches are well in hand. When this is completed the present goods yard will become part of the new lines. From Colwyn Bay to Llandudno Junction the work is so far advanced that the permanent way will be laid before long. There are several over-bridges to be completed, one being at Mochdre station, where a level crossing is being abolished. Of the under-bridges the most important is one opposite the Colwyn Bay Hotel. A few months will see this section of the line completed between Colwyn Bay and the Junction.

CHIPS.

Dr. Wheaton, Local Government Board inspector, held an inquiry at the union offices, Leigh, Lancs., on Tuesday, into the joint hospital board's application for sanction to borrow £1,540 for extensions at the Astley sanatorium.

Extensions to the St. Helens Hospital are now being carried out. The contract has been let to Mr. Fred. Brown, of St. Helens, for the sum of £13,269. The plans, providing for increased accommodation up to ninety-seven beds, have been prepared by Messrs. Briggs and Wolstenholme, and the possibility of future extensions has been kept in view.

Holy Trinity Church, Southport, standing in one of the oldest churchyards of the town, has been for some time considered unsafe for the congregation to meet in, and services consequently have been held in the schoolroom. The fabric is now being taken down with a view to another church being erected on the same site.

The Forbes Riding School, Newcastle-on-Tyne, has been removed from the Northumberland-road Yeomanry headquarters to new premises in Sandyford-road, in that city. The new buildings have been erected from designs by Mr. Rich, architect, of Newcastle. There are the executive rooms—office, dressing-rooms, harness and saddle-rooms, &c.—a riding-hall 130ft. in length, overlooked by a gallery, and at the further end stabling accommodation. Outside there is a run of some 200ft., which will be available for the training of volunteer artillery and exercises for horse artillery.

At Tuesday's meeting of the Leith Corporation it was decided to purchase the local section of the Edinburgh street tramways. The expected purchase price is £10,000. The tramways, which are still worked by horse traction, belonged to the original Edinburgh Company, but when the Edinburgh Corporation took over the city tramways and converted them into the cable system Leith refused to purchase their section, and hold a working arrangement. The corporation of Leith will doubtless electrify the system.

A new frontage is to be built at the Victoria Station, Manchester, and the work has been already begun. It is the intention of the Lancashire and Yorkshire Railway Company to set up a block of buildings which will extend from Long Millgate to the present refreshment-rooms at the top of Hunt's Bank. The buildings will harmonise, architecturally, with the present offices in Hunt's Bank and Victoria Parade. The ground floor will be arranged for the general accommodation of passengers, and there will be offices in the higher stories for head officials of the company.

The formal opening took place on Thursday in last week of the Glossop electric tramways. The lines at present opened connect Glossop with Uddingfield by way of Dinting, and the length of this proportion of the track is 3½ miles; there is also a short branch line ½ mile long to Whitfield.

Reopening services will be held on Sunday next at Trinity Presbyterian Church, Cloughton, Birkenhead, after redecoration and the insertion of stained-glass memorial windows. The windows and general decorations, with the exception of one window, were designed and executed by Messrs. J. and W. Guthrie and Andrew Wells, Ltd. (Glasgow), Mr. John Russell (Birkenhead) being the contractor for the painting. The other window was designed and executed by Mr. Arthur Dix, of Berners-street, London. The ceiling and woodwork were carried out by Mr. W. H. Forde, Birkenhead.

PROFESSIONAL AND TRADE SOCIETIES.

MANCHESTER SOCIETY OF ARCHITECTS.—Ten of the members of this society visited Ashbourne, in Derbyshire, on Saturday, Aug. 15. Almost continuous rain prevented much outdoor sketching. Fortunately, the interior is very interesting, including some good Early English windows and decorated work and some fine tombs. The curiously irregular transeptal plan, with chapels, gives some very picturesque vistas internally, and a long day's sketching proved all too short. On the evening of Aug. 25, fifteen members visited Parr's Bank, Spring-gardens, by the kindness of Messrs. C. Heathcote and Sons, the architects. Mr. Heathcote, jun., explained the building to the visitors, and the visit was a very interesting one.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.—The new session of the Royal Institute of British Architects will be opened on Monday, November 2, when the President, Mr. Aston Webb, R.A., will deliver an address. The subsequent meetings of the Institute will be held on Nov. 16 and 30, Dec. 14, Jan. 4 and 18, Feb. 1, 15, and 29, March 14 and 28, April 18, May 2 and 16.

SANITARY INSPECTORS' ASSOCIATION.—On Saturday a number of the members of the Sanitary Inspectors' Association left London on a fortnight's tour through Belgium, and also with the intention of taking part in the Eleventh International Congress at Brussels, which opened on Wednesday of this week. The visits will include several hospitals, the quays, and docks, the northern pumping station, &c., at Antwerp; the abattoirs in the Boulevard d'Anderlecht, and other sanitary works of interest in Brussels; and the Waterloo battlefield.

Plans and estimates are being prepared for the Keighley Town Council with a view of reconstructing and electrically equipping the existing tramway, and for the construction of a new electric tramway between North-street and Stockbridge, by way of Cavendish-street and Bradford-road.

The work of laying the mains in connection with the supply of water to Studley, Warwickshire, has now been completed, and the final testing of the mains and hydrants took place on Tuesday by Mr. Gander, the district council's surveyor.

The Basford Rural District Council have decided to adopt a scheme of drainage for Barton Joyce at an estimated cost of £5,000.

The Earl of Coventry laid the foundation-stone of the new Worcestershire County Lunatic Asylum near Bromsgrove yesterday (Thursday).

Operations were begun on Friday in connection with the laying of rails for the tramways at Coatbridge, N.B. A start was made near to Hutton-street, and double rails will be laid eastwards. Messrs. Dick, Kerr, and Co. are the contractors, and already a gang of over sixty men are at work. Lining has been granted for the erection of the tramway sheds in Jackson-street, the estimated cost being £3,500.

Mr. M. K. North, Local Government Board inspector, held an inquiry at Aldridge on Friday into an application by the Walsall Rural District Council for sanction to the borrowing of £1,500 for the purpose of extending the present sewerage system. The surveyor (Mr. F. W. Mager) explained that the parish had a population of 2,478. The extension of the sewers has become necessary owing to recent building operations.

The Furniture Trades' Provident and Benevolent Association has been formed, with Mr. Samuel J. Waring, jun., as president, supported by a board of management composed of many of the leading representatives of the trade in all parts of the country. A festival dinner will be held at the Criterion Restaurant on Nov. 14 in aid of the association's funds. The offices of the association are at 250, Finsbury Pavement Hoase, E.C.

Mr. Maurice Fitzmaurice, C.M.G., chief engineer of the London County Council, who has been inspecting public works in the United States, sailed for England on the *Umbria* on Saturday. Before leaving he spoke in high praise of New York's subway operations. "New York," he said, "is ahead of London in subway matters."

The opening of the group of cottages which the miners of the Cowpen group of collieries have erected as a memorial to the memory of their late employer, Mr. G. B. Forster, was carried out on Saturday afternoon. The cottages, eight in number, are situated near Cowpen Colliery, and have cost £1,400.

Mr. E. Wareham Harry, the borough engineer and surveyor of Cambridge, was thrown out of his trap in Sidney-street in that town on Monday, and had one arm broken and the other badly hurt.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the BUILDING NEWS, Clement's House, Clement's Inn Passage, Strand, W.C., and not to members of the staff by name. Delay is not infrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to THE STRAND NEWSPAPER COMPANY, LIMITED.

Telegraphic Address:—"Timeserver, London."

Telephone No. 1633 Holborn.

NOTICE.

Bound copies of Vol. LXXXIII. are now ready, and should be ordered early (price 12s. each, by post 12s. 10d.), as only a limited number are done up. A few bound volumes of Vols. XXXIX., XL., XLVI., XLIX., LIII., LXI., LXII., LXIV., LXV., LXVI., LXVII., LXVIII., LXIX., LXXI., LXXII., LXXIII., LXXIV., LXXV., LXXVI., LXXVII., LXXIX., LXXX., LXXXI., and LXXXII. may still be obtained at the same price; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

Handsome Cloth Cases for Binding the BUILDING NEWS, price 2s., post free 2s. 4d., can be obtained from any Newsagent, or from the Publisher, Clement's House, Clement's Inn Passage, Strand, London, W.C.

TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 0d. (or 6dols. 30c. gold). To France or Belgium, £1 6s. 0d. (or 33fr. 30c.). To India, £1 6s. 0d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 0d.

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of eight words, the first line counting as two, the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Situations and Partnerships.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" and "Partnerships" is ONE SHILLING FOR TWENTY-FOUR WORDS, and Sixpence for every eight words after. All Situation advertisements must be prepaid.

Replies to advertisements can be received at the office, Clement's House, Clement's Inn Passage, Strand, W.C., free of charge. If to be forwarded under cover to advertiser an extra charge of Sixpence is made. (See notice at head of "Situations.")

Rates for Trade Advertisements on front page, and special and other positions, can be obtained on application to the Publisher.

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page advertisements and alterations in serial advertisements must reach the office by Tuesday morning to secure insertion.

"BUILDING NEWS" DESIGNING CLUB.

SEVERAL correspondents have inquired when the New Season will commence. The awards will be published by the end of the month, when the first subject will be given.

Correspondence.

OUR DESIGNING CLUB AND ITS COMPETITORS.

To the Editor of the BUILDING NEWS.

SIR,—I have several times thought of expressing my indebtedness to the BUILDING NEWS Designing Club. An incident to-day has decided me to do at once, for, in turning over some old papers, I came across your award in such Club for 1881, there, towards the bottom of the list of those whose efforts called for recognition that year, my name appears; while the name at the top, as winner of the first prize, recalls some pleasant days spent as junior at a drawing-board alongside you. Am pleased the Club is so well sustained, and evidently, by your awards and published

plates, continuing its splendid work for rising students.—I am, &c.,

WILLIAM LUCAS.

Lyle's Chambers, Church-street, Pietermaritzburg, August 4.

[We are very pleased to receive this letter, and to publish in another column the particulars of the big job our correspondent has in hand. All prosperity to him and every other old BUILDING NEWS Designing Club-man.—Ed. "B.N."]

Intercommunication.

QUESTIONS.

[12300.]—Supporting Tank.—I have to fix a 900-gallon galvanized iron tank 14ft. above the ground and propose carrying it on three steel girders resting in the house wall, which is 2ft. thick, of stone, and on a 9in. brick wall forming a passage 3ft. 6in. wide between it and the house wall. The brick wall built in has mortar is only 8ft. high; it will, therefore, under tank, have to be carried up in the form of a pier 7ft. high, 7ft. long, and 9in. thick. Is this supporting wall sufficiently strong to carry its proportion of the tank and contents?—BUILDER.

[12001.]—Borton Church.—While cycling through Norfolk on my holidays, I came across a very handsome modern church at Borton, about twelve miles north of Norwich. It is decorated in style, and the windows are of great beauty. If readers could refer me to back numbers, or other sources, giving information or illustrations of it, I should be much obliged.—D. W. CLARK.

LEGAL INTELLIGENCE.

A SARDINIA-STREET ARBITRATION.—Sir John Wolfe Barry has issued his award as umpire in the arbitration which has recently been held to determine the amount to be paid by the London County Council to the Metropolitan Electric Supply Co., Ltd., for the compulsory acquisition by the Council of the company's generating works at Sardinia-street, Lincoln's Inn-fields. The London Improvements Act, 1893, provided that, in addition to vesting in the company a new site of equivalent area to their present one, the Council were to pay to the company a sum equal to the costs and expenses of erecting and fitting up a new generating station upon a new site, with new plant of a capacity to generate and supply electrical energy to an output of not less than 4,000 kilowatts, and all expenses incurred in replacing, relaying, and altering mains. The amount of the award is £183,150.

THE MURAL AND DECORATIONS SYNDICATE, LTD.—A summary of accounts of the Mural and Decorations Syndicate, Ltd., in liquidation, together with some observations upon the affairs of the company, have been issued by Mr. H. Brougham, Official Receiver. The deficiency with regard to creditors is returned at £18,603 11s. 8d., and, with regard to contributories, £28,650 11s. 8d. The Official Receiver states that the company was incorporated on March 23, 1893, with a nominal capital of £25,000, to acquire and extend a branch of the business carried on in the style of the Mural Decorations Co., at 50, Milton-street, City, and at Kingston-on-Thames. No remuneration was paid to any of the directors, with the exception of Sir George Thomas, who received £15 per month as deputy managing director, and Mr. Charles Petri, who received a salary of £390 per annum as managing director. The trading of the company appears to have resulted in a large loss, and on January 29, 1902, a resolution was passed to the effect that the company was unable to meet its indebtedness, Sir George Thomas being appointed receiver for debenture holders. The failure of the company was attributed to want of working capital, and to liability under an award given against the company in an arbitration arising out of a contract between the company and a builder. The liquidation is in the hands of the Official Receiver.

A SPALDING ARBITRATION AWARD.—The arbitrator (Mr. W. Scorer, of Lincoln) has given his award in the case of J. R. Baker, builder, of Moulton Chapel, Spalding, v. F. Neal, farmer, Mill Green, Spalding, which was entered for Lincoln Assizes. The claim was for £100 due under a contract for the erection of a house, but the defendant alleged unreasonable time taken, defective work, and entered a counter-claim of £50 for extra work and inconvenience. The arbitrator awarded Mr. Baker £39 is., and disallowed the defendant's counter-claim.

RE R. BANNER OAKLEY.—The adjourned hearing of an application to approve a proposal for the payment of a composition of 7s. 6d. in the pound in satisfaction of the claims of creditors took place on Tuesday before Mr. Registrar Hope. The debtor, Richard Banner Oakley, was described as of Queen Victoria-street, ventilating engineer and financial agent, and Mr. H. E. Burgess, who attended as Assistant Receiver, reported that he was still undischarged in respect of three previous bankruptcies in 1874, 1876, and 1888. He submitted, therefore, that no proposal should be accepted which provided for the payment of less than 20s. in the pound.

The liabilities were now returned at £341 7s. 1d., and the debtor had not deposited the funds required for payment of the composition, although he had been allowed further time for the purpose. The debtor asked for further time to enable him to carry out the proposal. Mr. Registrar Hope declined, having regard to the facts reported, to allow the matter again to stand over, and dismissed the application.

IN RE JOHN HOWARD.—This was a sitting for the public examination of John Howard, of 432 and 433, Kingsland-road, builders' merchant, trading as John Howard and Co. The debtor filed his own petition, and subsequently supplied a statement of his affairs showing gross liabilities amounting to £18,961 5s. 8d., of which £11,749 3s. 3d. was expected to rank, and assets estimated to produce £5,655 0s. 11d. In reply to Mr. H. E. Burgess, Assistant Official Receiver, the debtor stated that in December, 1883, he made a private arrangement with his creditors, under which he paid a composition of 5s. in the pound on liabilities amounting to £1,000. His present insolvency was largely brought about by bad debts incurred in his business. During the past four years he had incurred bad debts amounting to £2,800. Other causes of his insolvency were the insufficiency of his capital for the business, and interest on borrowed money. Upon the application of Mr. Eoever, solicitor, appearing for the trustee, the matter was adjourned to Oct. 14 for further investigation.

A STATUTE OF LIMITATIONS UNDER THE BUILDING ACT.—At the South-Western Police-court on Friday Mr. John Alexander Floate, residing at Tremadoc-road, Clapham, answered to a summons to show cause why he should not be required to remove a wooden addition to the rear of his house, the same having been erected in contravention of the Building Act. Mr. Nicholls appeared for Mr. William Grellier, the district surveyor, by whom the proceedings were instituted. The addition was built many years ago, and it was argued for the defendant that, as the Building Act of 1855 has since been repealed, the court had no jurisdiction. Mr. Nicholls urged that the irregularities committed under the early Act were not brushed aside by the later Act of 1894. The Magistrate pointed out that the Act required that proceedings should be taken within a period of six months. Mr. Nicholls: But the addition was not discovered until May last, and a notice was then served on the defendant. The Magistrate: Do you contend that a district surveyor could come to the court and obtain an order for the demolition of a building erected, perhaps, thirty or forty years ago because of some irregularity? Mr. Nicholls answered in the affirmative, and maintained the six months' period counted from the date of the notice. The Magistrate thought the district surveyor should have found out the irregularity before. He dismissed the summons, with £2 2s. costs.

A BLUNDELL SANDS ARBITRATION.—Mr. R. Clutton, sole arbitrator in the inquiry which was held recently at the Surveyors' Institution ("Blundell and the Secretary of State for War") has issued his award. The proceedings had reference to 40 acres of sandhills near Blundell Sands Station on the Lancashire and Yorkshire Railway, a few miles from Liverpool, and also to 700 or 800 acres of foreshore sand lying in front of them. The claim approximated to £55,000, and was brought by Colonel Blundell to determine what amount should be paid to him by the War Office for the compulsory acquisition of the property for the defence of the Mersey. The land has been acquired for the purposes of a fort for gun-firing practice, and it was contended on behalf of the claimant that a fort put into the middle of the estate must be a considerable detriment to the property for various reasons. The expert witnesses called on behalf of the claimant generally agreed that the total value of the property and the damage was upwards of £18,000, while those called for the War Office put the total at about £17,642. The arbitrator's award amounts to £17,642.

A LONG ACRE ARBITRATION.—Mr. John Troutbeck, sitting in the Westminster High Bailiff's Court, with a special jury, had before him last week, the case of Jacobs v. the Great Northern, Piccadilly, and Brompton Railway Company. This was a printseller's claim for compensation for the compulsory acquisition of the premises, 43, Long Acre, required by the promoters for the purposes of their new Covent-garden station. The claimant holds the premises on a lease at £125 per annum, and, according to his case, the premises had a profit rental of £155 a year, in respect to which he claimed £1,261, including 10 per cent. for forced sale. Other items were, £100 for fixtures, and five years' purchase of the trade profits at £500 per annum. He also asked for compensation for depreciation of his stock. After the jury had viewed the property, counsel agreed to a verdict for £3,000. By direction of the High Bailiff, the jury returned a verdict accordingly.

The sales at the Mart last week, as registered at the Estate Exchange, amounted to £7,775, and for the corresponding week of last year £9,045.

Our Office Table.

DISCOVERIES of great interest are reported from Brough, near Bradwell and Hope, where formerly stood a Roman town and military station, and where excavations have been made during the last fortnight by Mr. John Garstang on behalf of the Derbyshire Archaeological Association. On Saturday afternoon the members of the Derbyshire Society visited the spot, the company including visitors from Sheffield, Nottingham, and Manchester. Mr. Garstang gave an account of the work, showing that the walls had been traced round an area of about three acres. One corner was rounded off close to the River Noe, and at the other corner there was a tower, the foundations of which had been bared. This was a Roman fortress of the type that was built in the 1st and 2nd centuries. Indications of three gateways had been found, but there would, of course, be four. The Roman causeway had been found to lead across the top of the inclosure complete, and two posts had been found on which swung the doors of the fort. There were also the foundations of the guard chamber. In the centre of the fortress was a very large rectangular stone building, most probably the praetorium. The entire field was covered with stone buildings—in fact, it was one of the most important discoveries yet made. In some old Roman forts the buildings outside the praetorium were of wood, being only of a temporary character, but here all the buildings were of stone. Two Roman altars had been found, the inscriptions on which have yet to be deciphered. A special feature of interest consisted in portions of a large tablet 5ft. in length; the inscription, occupying six rows of large letters, shows that it was set up when Antoninus Pius was Emperor by a Prefect of the First Cohort of Aquitanians, under Julius Verus, then Governor of Britain. Mr. Garstang pointed out that the whole area was drained by a regular water system of stone drains, which were still perfect.

The excavation of Roman remains at Caerwent, near Newport, Mon, is being successfully carried out by a committee, of which Mr. A. T. Martin, of the College, Bath, is the secretary. Among the features recently brought to light are some Roman houses near the schools, with a later house overlaying one of them. It is impossible to fix the date of the later house, but it is not Roman. It includes a small subterranean chamber, or cellar, built largely of Roman materials. The line of pipes which was traced near the north gate was again discovered in this field, with the addition of a small concrete culvert, and some portions of streets have been discovered. The present is the fourth year of the exploration committee's work, and it promises to produce results even more important than those of last year.

The Garden City Pioneer Co., Ltd., has acquired about 4,000 acres of land near Hitchin on which to build the first garden city. The estate is about 34 miles from London, and the nearest point is a little over a mile from Hitchin Junction, on the Great Northern Railway, the latter being reached in 42 minutes from King's Cross. A company will shortly be formed to carry out the scheme. A cumulative dividend limited to 5 per cent. per annum will be paid to the shareholders, and the balance of profit will be used for the benefit of the town and its inhabitants. Information regarding the scheme can be obtained from the secretary of the company, Mr. Thomas Adams, 347-351, Birkbeck Bank Chambers, Holborn.

On Saturday the London lodges of the Operative Bricklayers' Union visited Chatham, where they celebrated "Bricklayers' Day" by joining with the Chatham and Rochester Branch of the union in a great demonstration with band and banners through the main streets, concluding with a mass meeting in the Rochester Recreation Grounds. The local speakers included Messrs. R. Powell and A. W. Ireland, of the Rochester Corporation; W. J. Lewington, of the Gillingham District Council; and E. P. Wake, president of the Medway District Trades Council. Mr. H. Rolfe was chairman. The London leaders included the general secretary of the society, Mr. J. Batchelor; Mr. H. R. Taylor, London County Councillor; Councillor Condon, of Hackney; and Mr. A. Lake, a veteran trades-unionist. The burden of the speeches was "no connection with either of the orthodox political parties, but direct labour representation in county, municipal, and district councils, and in Parliament."

THE annual report on the museums, colleges, and institutions under the administration of the Board of Education includes the Victoria and Albert Museum; Royal College of Science, London; Royal College of Art, London; and the Geological Survey of the United Kingdom and Museum of Practical Geology. The most striking feature brought out in that portion of the report which relates to the Victoria and Albert Museum is the steady decrease in the numbers of the public availing themselves of the institution. The figures of attendance in all cases are given for the period of 1898-1902 inclusive. In the reading-room returns of the Art Library, which embrace attendances of readers, work consulted, and permission for use of water-colours, there has been a general decline as compared with the years 1898, 1899, and 1900, but an advance as compared with 1901, in which year the figures in each class touched low-water mark. There is also a marked and steady decrease recorded in the figures relating to the Science Museum and Library, and that in no year was the decrease stayed. Students in Department Schools have fallen from 9,695 to 6,425, and consultants of patent specifications and school teachers also show a decline. The same evidence of dwindling public interest is found in the return of the number of visitors to the Western Galleries (Collections for Scientific Instruction and Research). At Bethnal Green Museum the number of visitors during last year was 407,999, a decrease of 81,053 as compared with 1901. Of the Royal College of Art the report says: "It is gratifying to find that in every branch of the work done in this college good progress is reported, and there are not wanting proofs that the present curriculum of the college is well calculated to carry out the object for which the college was founded—namely, the training of art teachers and craftsmen who will one day take part in leading the taste of the country in matters of art. The craft classes adapted for designers are beneficially affecting the students."

UNDER the auspices of the Sanitary Institute, the 36th course of lectures and demonstrations for sanitary officers will be given during the next two months, beginning on Monday, the 14th inst. The course includes the following lectures:—In Part I., four on elementary physics and chemistry in relation to water, soil, air and ventilation, and meteorology, and twenty-one on public health statutes, the practical duties of a sanitary inspector, municipal hygiene or hygiene of communities, and building construction in its sanitary relations, local physical conditions; measurement and drawing plans to scale. Inspections and demonstrations are arranged in connection with the lectures, and include visits to disinfecting stations, dairy premises, municipal depots, artisans' dwellings, offensive trades, water-works, common lodging-houses, sanitary works in progress, refuse and sewage disposal works. In Part II., seven lectures will be on meat and food inspection. The lectures at the Parkes Museum, Margaret-street, W., will end on Wednesday, November 25.

A CONSULAR report reveals the fact that the "mother-of-pearl" so familiar as an inlay in all sorts of furniture and woodwork from Damascus is not real "mother-of-pearl" at all. It is obtained from a common fresh-water bivalve found in large quantities at Deir-el-Zor and other places on the banks of the Euphrates, and not from the Red Sea oyster, as is commonly supposed. If the latter were employed, the cost of the various articles which it serves to adorn would be far greater than it is, the price of the common shell being about 1d. per pound, whereas the genuine article costs from 1s. to 1s. 7d. per pound. "However," says the British Consul at Damascus, "it can hardly be maintained that any deception is practised, because the eye, even of the amateur, can distinguish at once the difference between the two, the exquisite iridescent sheen, delicacy of colouring, and general brilliancy of the one being entirely absent in the other."

THE Vacation Judge, Mr. Justice Walton, on Wednesday, authorised the expenditure of about £3,000 from the Sebright capital on the old Hertfordshire mansion, "Beechwood," belonging to Sir Edgar Sebright. Incidentally, Mr. Bramwell Davis, K.C., showed that the dilapidated condition of the house reflected the wanderings of an ancient family. The present baronet's nephew and predecessor had never lived there, while that man's predecessor had been mixed up in gaming and money-lending transactions still

referred to with hushed voices in the country-side. One alteration is to be a separate entrance to the beer-cellar. At present the only way into it is through the strong-room—perhaps an instance of the suspicious nature of old-time occupants or their architects.

A PARLIAMENTARY RETURN has just been issued showing the amount spent on technical education by local authorities in England and Wales during the year 1901-2. Particulars are also given of the amounts raised by loan on the security of the local rate under the Technical Instruction Act, 1889—mainly for the erection of science, art, and technical schools—of the amount of loans so raised outstanding on March 31, 1902, and of the balance in hand of moneys received and allocated to technical education. The Return shows that the total amount thus expended on technical education in England and Wales during the year 1901-2 was £1,057,399 0s. 2d. This amount is exclusive of the sums allocated to intermediate and technical education under the Welsh Intermediate Education Act, 1889. The amount raised by loan on the security of the local rate under the Technical Instruction Act was £206,426 4s. 7d., the amount of loans so raised outstanding was £1,030,952 12s. 5d., and the balance in hand of moneys received and allocated to technical instruction was £658,319 16s. The total amount of the residue received under the Local Taxation (Customs and Excise) Act, by the councils of counties and country boroughs in England (excepting the county of Monmouth), in respect of the financial year 1901-2 was £855,257 14s. 5d., of which £817,969 15s. 7d. was appropriated to educational purposes, and £37,287 18s. 10d. to relief of rates. Of the 49 county councils 41 are applying the whole of the residue to technical education, and 8 a part of it to the same purpose. Of the councils of the 64 county boroughs, 59 are devoting the whole, and 5 a part of the residue to technical education. Further, 3 county councils and the councils of 30 county boroughs, 99 boroughs, and 189 urban districts, in England, are making grants out of the rates under the Technical Instruction Acts; and 25 local authorities are devoting funds to technical education out of the rate levied under the Public Libraries and Museums Acts. The total amount expended on technical education during the year was £1,068,917 11s. 3d. The total amount of the residue paid to the 13 county councils and the councils of the 3 county boroughs in Wales and Monmouth was £41,042 4s. 1d. These local authorities are devoting the whole of it to intermediate and technical education. The total amount expended on technical education in Wales under the Technical Instruction Acts during the year was £48,451 5s. 11d.

MESSRS. WM. AUGS. GIBSON, LTD., of Temple Bar House, Fleet-street, the well-known makers of electric, hydraulic, and hand-power lifts, have our sincere thanks for a most useful envelope-opener they have sent us. The average envelope-opener is a delusion and a snare; but this handy little tool is the embodiment of despatch, and lifts loads of works from the fingers of people with a big letter pile on their desks, with the celerity and certainty of the other lifts for which the donors are famous, and of which every reader who gets one of these admirable labour-savers will be pleasantly reminded every time he uses it.

STATUES, MEMORIALS, &c.

WANTAGE.—The dedication of the memorial cross erected by Lady Wantage to the memory of her husband, Lord Wantage, V.C., K.C.B., took place at Lockinge Down, Wantage, on Saturday afternoon. The monument is erected on the highest point of the down, upon an ancient burrow, and will form a conspicuous landmark. The base is an octagon pedestal of Portland stone, bearing an inscription, and from it rises a tall marble pillar supporting a short red marble shaft culminating in a carved white marble cross. The height of the monument is 33ft. 6in., and the column and cross are exact copies of the San Zenobio at Florence, and were carved in Italy.

A destructive fire occurred on Sunday at the premises of Messrs. R. May and Sons, timber merchants, in Frensham-street, Peckham. Three large stacks of timber, each about 40ft. long and 40ft. wide and standing about 20ft. high, were first destroyed, and the flames then involved a building measuring 45ft. by 15ft., used as a boiler-house. The fire is attributed to the overheating of the boiler.

THE BUILDING NEWS

AND ENGINEERING JOURNAL.

VOL. LXXXV.—No. 2540.

FRIDAY, SEPTEMBER 11, 1903.

CLIENTS AND THEIR REQUIREMENTS.

A GREAT deal of the work done by the profession is of a discursive character. It refers to interviews with clients about site, the plan and design of the intended building, about cost, legal business negotiations, and a variety of other matters of an informal kind. In these interviews the education, culture, and experience of the professional adviser are called into exercise. They depend upon what he has seen and read, rather than upon his actual acquirements as an architect. As a rule the average practitioner is not a widely read man; he may have good business qualifications and practical knowledge of building, but his acquaintance with subjects outside his own vocation is often not equal to that of a client who has moved in a different sphere of life to his own, who has travelled much, and has a general acquaintance with men and letters. A client of this sort may come to him with a keen sense of the requirements of a gentleman's residence, and even a knowledge of architecture that may embarrass him, of a type of plan or a mode of decoration about which he knows very little; and it is expecting too much to find his requirements or hopes realised in the design. No doubt such a case is a rare one, but it occasionally happens. The client's ideas are distinctly of a more advanced order than his architect is accustomed to satisfy. The client is disappointed at the result, and may even think he could have designed a better house himself if he could only have put his ideas into the shape of plans and elevations. But it is so hard to bring one's preconceived views to the test of the standard required. There are plenty of business men, too, who have a better sense of what they want than the architect can give them. They know the details of their business or trade better, but they have not the means of putting their wants into a practical shape. These are the men whom the architect is often confronted with; individuals with clear ideas of their wants, but unequal to the task of putting them into form. In short, the function of interpreting another's wants and tastes is one of the most difficult. The only way in which it can be learned is to place oneself as nearly as possible in the position of the client, to try to see as he sees, to enter into his business habits and tastes, to try to realise his surroundings and mode of life, which can only be done by a study of the details of his business and character. If the architect could spend a few days or weeks with his client observing closely his talents and tastes or his business requirements, a better idea could be gained than a short interview affords. But such a thing is impossible. Instruction by word of mouth or writing is the only way that is available, and, of course, a great deal is taken for granted on both sides, which may mean a considerable divergence from the intentions of the client. Thus the latter's instruction about requirements is assumed by the architect to be in accordance with ordinary types, whereas the client intended something widely different. Where the latter understands plans, the architect's duty is simple. He can submit sketches of one or two types of house and find out exactly what the client desires. The gentleman who is fond of sport will require a very different kind of house to a country gentleman who entertains largely or has a hobby of one kind or another. A great difference arises in

habits and tastes which no perfunctory verbal instruction would reveal; but the architect is presumed to know, and this presumption on the client's part constitutes one of the troubles the professional man has to diagnose. Of course, these difficulties are greater in the case of a man whose education and tastes are much inferior to those of his patron. He cannot enter so keenly into his client's tastes, his sympathies are widely different, and it is impossible for him to see, eye for eye, as his client does. The consequence is, the design is not a success—there is a note of discord apparent.

If we consider the other and larger class of clients which the profession have to treat with—the uneducated man whose wants and tastes are on a much lower level, and who has to be instructed up to the standard of respectable society, the case is different. The architect must lower his standard, as he cannot always manage to raise that of his client. It must be a compromise. This sort of client has been brought up with strange and prejudiced ideas of all architectural matters; he does not know anything about plan, which is an enigma to him; nor can he express himself intelligibly as to his requirements. In a majority of cases he does not know what he wants; the professional adviser has to diagnose and find out the requirements and tastes of his client, and the tact and method of ascertaining these are not the gifts of everyone. Consultation is one of the means open to the architect: it must be a free rather than a formal act of deliberation—a meeting to take counsel together to elicit from the client the real wishes he has in view. Having ascertained these, the adviser is better able to make a decision as to the kind of plan and design that will be suitable. But with clients of this kind there is often a dictatorial attitude assumed on the part of the professional man, who puts before his employer a design in a sort of "There, that-is-the-plan-that-you-want" way. No doubt there is much to disgust the sensitive architect; this kind of client is always thinking that as he pays he ought to have what he likes, that the architect has only to submit drawings or pictures that will satisfy his views and taste. To take a few instances. There is the inevitable builder-client who regards himself as an authority on house-building, but who simply desires his own ideas drawn out. Of course, he does not wish to pay the professional commission, and wants to make an agreement with the architect. If this is consented to, and plans are prepared, the chief difficulty experienced is to bring one's matured conception of design down to the level of a man who is an amateur in building—who desires a square house of box-like type, a double-fronted villa with a centre entrance between two rooms. The architect has to use his arts of persuasion to overcome this prejudice—one of the most inveterate to deal with. Then there is the "practical client," who desires to have everything settled and square; to know the cost, and who undertakes to buy all the materials himself, and to look after the work if the architect will prepare the plans. He is strong on ventilation, the economy of a good square-built house, and on certain hobbies of his own. Or there is the client who wants a house built to fit his furniture, his large dining-room table and sideboard, and other special pieces of old furniture, his pictures, &c. The wife wants her carpets and curtains to be made the controlling feature; the rooms must be of certain size and height. A "handsome carved sideboard" of large dimensions must be provided for at all costs, though its size may add considerably to the cost of the house.

These are typical clients of the modern architect. Each of these has to be studied as a specimen of the *genus homo*. Each will have a standard of his own, which the architect will do wisely to study, not with the

view of conceding to all the whims, but of endeavouring to talk the matter over in a business point of view, and of showing the client the mistake or error of certain things he entertains, such as the plate-glass window craze or the centre front entrance. The requirements of plan alone afford the occasion of many homilies and dissertations on taste and good planning. The client with a fancy for a central hall and costly staircase right in front of the main entrance has to be reasoned with in a conciliatory way before he is inclined to give up his fad. The love of ostentatious display and living is one of the commonest weaknesses of the successful tradesman and British Philistine, and once the client can be brought to realise that the arrangement he wishes is not in good taste or adapted by people of a superior class, he may be inclined to listen, if not willing to give up his idea. Fashions and popular notions die hard, and if the architect cannot persuade his employer to abandon a particular fad, he will be doing his duty in dissuading him and advising him to adopt another plan less open to objection. In the planning of country and detached houses, it is still hard to convince such people of the mistake of certain arrangements that are popular; of the lack of privacy in doors to principal rooms opening near the entrance, or of a staircase ascending straight before the front door. But there are people who like to see and to be seen, and for them, the centre entrance which enables all visitors to peer through the windows on either side, and those inside to scan those who are approaching the house, is a coveted one. The architect would be giving away his profession and reputation if he did not argue with his client on the undesirability of these and other arrangements. To easily yield to the prejudice is to forsake his position as a professional adviser, and lay himself open to disparaging remarks by those who happen to visit the house, and who have sounder views of building, including the client himself, whose tastes may in the course of time undergo a change. The aspect and outlook of windows is another point which is often seriously misjudged by those who build. In this case, of course, little choice remains for buildings in towns; but when the site is open there ought not to be any doubt. An employer has a preference for his principal rooms to face in a certain direction or towards a road, quite regardless of the proper aspect for the room or its real comfort in summer or winter. The architect ought to be, in such a question, an authority, as it is so vital to the comfort and health of the inmates. He should make it clear that the best aspect for principal rooms is the south-east or south in our hemisphere; that windows should look eastward for morning sunshine; for midday sunshine, south; for evening, westward; and for coolness, eastward, the best compromise being south-east. That between south and south-east the aspect is genial, and between that and north-east, dry; while the rough winds are found in positions from south to west, and the stormy aspects between north and south-west. There is an ample choice for plans which are not restricted as to site. His authority on these points ought to be quite as much uninfluenced by lay ideas and fancy—as that of a medical practitioner or lawyer, whose opinions the public accept without question. The professional man must be prepared also to meet the client who wishes that his house should be like that of another built under very different conditions on a site quite reversed—a very common experience in dealing with those who think a plan can be planted everywhere; that the front of a residence, for instance, facing south-east in the plan prepared can be made to face west or south-west equally well. Strong arguments against such a misappropriation ought to be availing. There should be no uncertain note in the attitude

of the adviser on such a fundamental point; nor should a client be able to dictate any opinion on the position of any window, door, or fireplace in any room which is contrary to judicious planning or design. We are afraid the employer is too often able to control his advisers on these points. They are details which appear to the uninitiated of small importance, though in reality the convenience and comfort of a house depend very much on them. Here also there are established principles which cannot be departed from without detriment. There are certain undesirable positions for doors, fireplaces, and windows. Thus a fireplace next to or on the same side of the room as the door, a door just opposite a fireplace, or on the return side near the fireplace wall are all bad. Again, the proportions of rooms, their height and lighting, size of windows are questions that the architect should control. Unfortunately, it happens sometimes that the client has a better sense of these things than his adviser, who has been trained on precedents, and has little scientific knowledge. We pity such an architect. We see such things as a small window of squarish proportions lighting a room of considerable size placed at one end or in the centre of a long wall; or a too-large window lighting a small room, and requiring to be curtained off on certain months of the year; very lofty small rooms or low large ones, windows at one corner leaving dark stretches of wall—all grievous mistakes, in a house or block of offices where light and ventilation are of vital consequence. Where planning is conducted without a knowledge of science or common sense, the enemies of the profession can revile, and the architect has a poor chance of enforcing his authority. In his work on "Rural Hygiene," Dr. Poore makes a few remarks that are worth quoting. He says: "Architects are educated for the most part in crowded centres, where the problem of how to get the greatest amount of accommodation on the smallest area is paramount, and it too often happens that the town-bred architect, when called upon to build a house in the country, is unable to cast away the unwholesome notions which have been engraved upon him in the city, and oftens fails sufficiently to appreciate that the building of a country residence is a problem quite distinct from the building of a town residence, and that nothing is so conducive to the comfort, beauty, and wholesomeness of a dwelling as is an ample area upon which to construct it." This observation is only too fully borne out by many who have examined the two classes of building. The town-bred and trained architect is often quite incompetent to design a country residence with any degree of freedom. The restraints of town building compel him to use all his resources in meeting the demands of municipal building regulations, and in adopting a type plan that is only suited to cramped sites, and his country residence bears the same marks of restraint and crampedness in its appointments. The reception-rooms are often not so large as they might be; the hall and stairs looked cramped, and the domestic offices are planned in a wing of inadequate size and accommodation; in short, the two sorts of design are very different, and cannot be well studied by the same individual. The training in town building has its decided advantages: it compels attention to economy and compactness of plan not so much needed in the country. Country life and town life are in many respects at variance: the habits and tastes of the two kinds of tenant are different. One requires ample space to move about; his rural tastes and sports have to be satisfied with accommodation of a much more liberal kind in the offices. The other lives a town and conventional life, and he confines himself to a few rooms, though these may require more decoration and finish than need be bestowed in the rooms of a country house. But one of the

main differences in the planning of a country house is in relation to the kitchen and offices. These may form an annexe even detached from the main part of house, where the cisterns, sinks, baths, closets, &c., should be located, and can be connected on both floors by cross-ventilated lobbies, if necessary. In this way the designer may isolate all sanitary offices from his building if he likes, though this is less necessary in the country than the town. There is no excuse, however, to be made for three-story residences where there is plenty of area, with nurseries on the top floor, and sinks and closets very near the bedrooms. Sanitary arrangements need not be carried to an extreme in a country residence, where there is plenty of air and space all round. The old types of hall and manor-house furnish the architect with good models; where the offices are placed round, or partially round, a court or kitchen garden, and the reception rooms grouped round the hall and opening out of it. In the smaller country house the hall or living-room ought to be the keynote of the house. Round this hall, which should be central, can be grouped the other rooms, the children's room, "den" and "bower," with an annexe for the kitchen offices. While clients' wishes and tastes will differ widely, and must be respected in their special requirements, the architect must not swerve from his duty in pointing out essentials and those fundamental principles we have noticed. His motto should be: "In things essential unity, in non-essentials liberty." The client comes to the professional man for advice and experience in his special sphere, and it is unworthy of the trust reposed in him if the latter yields unwittingly to the whims of his employer.

In the realm of taste, very few clients would deny their ability to decide on questions of style or decoration, although as a matter of fact there is no other branch in which they commit greater mistakes. The successful tradesman who builds a house in a fashionable suburb believes, of course, that "Queen Anne," or some modern craze of house building, is the right one to adopt, and he orders his architect to design his residence in that style; but he knows nothing about the matter, and would as soon blame his adviser probably for not giving him a design he liked better in some bizarre or showy style: so inconsistent are people who have no real taste for art. Then we have heard of people who have a pretence for art desiring a "Queen Anne" house, but who at the same time wish their architect to give them bay windows of plate glass in large panes, so that the lady's lace curtains may be displayed to advantage. These and other anomalies are common amongst clients who wish to dictate in art. We know in such matters as the selection of wall-papers and ceiling decoration how the most grievous mistakes are made. Rooms with a north aspect are covered with papers of dark and sombre hues, instead of with bright and cheerful tints, and rooms facing south having abundance of sunlight made unendurable by wall-papers of strong or warm colours. Nor is the height, purpose, and size of rooms considered in the pattern when we see such things as lofty rooms covered with papers in which vertical stripes or panels abound, where a pattern of horizontal features would be more tolerable; and a dining-room having a bold-patterned wall-hanging over which pictures are hung, instead of being of subdued tone, without any decided pattern or colour. These may appear small matters to the client, but they are just those indications of taste which are at once convincing to the man or woman who has the slightest knowledge or feeling for art. Tastes vary in degree. Thus, the wallpapers or decoration that would be the right thing in a refined West End locality would not be tolerated at the East End of London. Bright colours and decided patterns which would be admired in

a country cottage in the North would be thought vulgar in Regent-street; but though they vary, the same principles predominate, and prove the direction of true art.

STRUCTURAL DETAILS AND FITTINGS.

WHILE every branch of building has been written, discussed, and talked about, there has been a dearth of works on those structural details and fittings which form so important a part of every building of any pretensions. A building without fittings and furniture loses much of its purpose, beauty, and impressiveness. Even a room denuded of its furniture has a vacancy and meaninglessness about it; but in the furnished room we can appreciate the scale and intention of the architecture; we have evidence of human occupancy and the soul of the tenant. The furniture is the complement to the architecture; one cannot be complete without the other. Structural details comprise so large a part of the art that it would be impossible in a short article to discuss the subject in an adequate manner befitting its importance. Such details would include doors, windows, fireplaces, skirtings, dadoes, cornices, and a variety of other matters; but except in their relation to architectural style, we have very little information about them. There are very few rules about the proper size of doors and window openings for certain rooms, or the principles of design applicable to such details as skirtings or cornices, fireplaces, overmantels, and over-doors, though numerous designs are published, and their construction and measurement for quantities are to be found in numerous books. Even the important subject of staircases has been treated more in its connection with the architectural style of the building, or as a piece of joinery, than in a scientific manner relating to the actual requirements of the building. The reason of adopting a certain plan of stairs, their proper material, the relation of riser to tread, or the rules to regulate the "going" to the rise of stairs, are not discussed in the manner that the young student would like them to be. Their usual construction only is treated, and the technical terms defined; but the beginner in construction has to use his own unaided skill in determining many of the more important points. There are plenty of admirable precedents, but no instructions as to the principles of design. Floors and roofs have been more exhaustively treated, theoretically and practically; patented systems of construction have been described and illustrated; but to such questions as, which is the best floor for a certain building or room, or the best roof for a given span or shape of area, and for certain purposes, or how should it be constructed, and with what scantlings? answers are not easily found. The architect, in fact, has to evolve them out of his own mind. He must consider the problem he has to deal with—whether the building is for domestic or public use, the actual loads required to be provided for, the material at disposal. But this is not the way the average architect goes to work. He tries to find out a floor or roof that will suit him. He can do so by looking over the volumes of the BUILDING NEWS or a catalogue of floors and roofs, and he finally, by an effort of imagination, adapts, as well as he is able to, one of these types to his requirements. It may be a rather rough approximation to what he desires, and that is all, for he cannot at once hit upon an example that is exactly suitable—the conditions vary. So it is with every design made without first, a clear knowledge of what is wanted, and secondly, a method of working it out. These are the two things which the architect is often not certain about in his own mind—he may know one and nothing else. If he knows exactly what he wants

say it is a design for a roof over a given area, he is at a loss to find out how to make the necessary details, to draw out the members to their proper dimensions or scutlings from a proper calculation of the strains. To take as an example a floor: a certain safe load has to be allowed for, and it is necessary to find out the size of girder which has to carry perhaps half the load. The process is an easy one when understood; but the detail for girder cannot be made until the depth and breadth of girder is found by calculation. Probably the size of girder has been determined beforehand, but this must be verified, and its depth and width increased or additional columns placed below it.

The fixtures and fittings of buildings are no less necessary details to determine before the plans and working drawings of certain buildings can be made. We take here, by way of example, the desks and seats for schools required by the Board of Education. Before the accommodation of a school can be ascertained, the area per child or minimum floor-space has to be found, which is 10sq.ft. A school for older scholars can be planned only after we know how many of them can be seated at desks arranged in accordance with certain rules. These give 18in. per scholar at each desk and seat, and the length of each group of seats must therefore be some multiple of 18in., allowing 18in. for gangways between the groups and walls. Dual desks are about 3ft. 4in. in length, with gangways of 1ft. 4in., and for groups of desks a length of 12ft. is the maximum. These dimensions form the basis of any design. Rooms for cookery and manual instruction have to be laid down on plan, upon the units of certain fittings, tables, sinks, raised platforms, and desks. For cookery the floor space allowed is about 20sq.ft. per scholar. In laundry work a gallery or platform is necessary, with desks for 42 children; and the laundry tables have to be made to allow 3ft. of space for each scholar. In the manual instruction rooms the workshop model must be followed, and for science rooms, tables, sinks, cupboards, and shelves have to be provided for in the plan. An area of 600sq.ft. of floor space is considered sufficient, and for laundries and cooking-rooms about 750ft. In elementary science schools, where chemistry, physics, and mathematics are taught, the fittings and apparatus are necessarily simple, consisting of black boards against the wall, balance shelves for exercises with weights and pulleys, a table, and about three benches. But the architect ought to be able to fix their positions on the plan. The table and benches may be placed parallel to each other, the space between each not less than 2ft. 9in., so that the teacher may reach every pupil; the space allotted to each pair of children facing the teacher would be about 2ft. 6in. or 3ft. These benches are about 2ft. 4in. wide and 2ft. 8in. high. The sinks can be placed either against the walls or the ends of one bench. For ordinary classrooms, benches (says Mr. J. Lomas, A.R.C.S.) may be fixed along the walls. These consist of cupboards containing shelves projecting 5in. or 9in. into the room. The doors are hinged at the bottom, and when open form a working bench, and are supported on folding brackets. A gaspipe with nozzles for tubing at each working-place afford the gas supply, and water can be laid on at the corners of room. When the benches are closed, the whole form a series of cupboards round the room about 4ft. 3in. high. Sometimes one room serves as both a chemical and physical laboratory; but separate rooms are desirable for delicate physical instruments. For chemical laboratories, draught closets must be fixed, say, between the windows of a room, so that the extract flues may be carried up through the walls. These closets are about 2ft. 6in. wide by 1ft. 7in. deep, but larger ones 4ft. wide and 2ft. deep are often

required. The front of closet is closed by a glazed sash counter-weighted, and details of these may be seen in all chemical laboratories. The top is also sloped or hipped back, and also glazed like the front and sides of closet. Evaporation closets are often used in quantitative work, and these are described by Dr. Thorpe, and are made specially. They form a kind of lavatory arrangement, with copper pans or inverted cones, in slabs of stone or slate. The closets are each about 19in. square; there are lifting glazed sashes with glass partitions between each pair of closets.

Physical laboratories require good light and ventilation, and steady working benches. As vibration of any sort is objectionable, the physical laboratory should be placed on the basement or ground floor. For a laboratory for elementary work, a floor area of 30sq.ft. for each student, including gangways, &c., is thought sufficient. Benches may be wide, for students to work on both sides, or narrow, to be placed against the walls. The former may be 4ft., the latter about 2ft. 6in. For each worker the length of table top may be from 2ft. 8in. to 4ft.; but this depends on the kind of work done. Details and benches for physical work are given in Mr. T. H. Russell's useful work on the "Planning and Fitting-up of Laboratories" we lately noticed. A wall-bench consists of cupboards, with shelf, drawers, and leaves just below the bench-top, and above a rail supported on brackets from the wall. The lower arrangement of cupboards and drawers, about 3ft. high from floor, resembles a dresser. The bench top has sinks at intervals for the use of each pair of pupils, gas and water. The top of bench should be made of teak, which resists acids and withstands heat. Water taps and gas are laid on at intervals. These and other details may be found in any technical school, and are given in Mr. Russell's work. Our remarks here are intended to refer to plan rather than to the details of fittings. A laboratory must be planned with reference to the position and space occupied by each fitting. These, as we have said, consist of tables or benches of certain size placed in the centre of room, with sufficient space round each for students, or benches against the wall, a cupboard, a sink or sinks, and blackboard. The tables or benches may be square or oblong, but with the space for each worker. They can be arranged differently to meet the shape of room, but it is necessary to determine the most desirable arrangement before the actual dimensions of the room are fixed. We should advise for this purpose a number of pieces of thick drawing-paper or card cut to the dimensions by scale of the benches, sinks, cupboards &c. These should be arranged on paper, with the necessary gangway space, &c., between them, and the actual dimensions of room can be determined in this manner more conveniently than in drawing them on the plan at random, and then erasing them till a satisfactory arrangement is made. Next to the laboratory there should be a professors' room, with tables and benches; in connection with it a preparation room for apparatus and instruments, communicating by a door with the lecture room, near the lecture table, and a lecture theatre adjoining, with sloping seats. In fact, the laboratory, or laboratories if there are two, the professors' room, preparation-room, and lecture theatre should all be intercommunicable by doors, and also be entered separately from an outer corridor, which may be formed round an open area. A second small lecture room, an optical laboratory, and apparatus room are necessary in a well-equipped college. Such an arrangement of laboratories and lecture rooms may form a square round an open area. At the Manchester Municipal School of Technology, the laboratories and lecture-room form a long range on one side of corridors. On one floor

is an advanced physical laboratory, about 50ft. long by 26ft. wide, lighted on one side. This contains tables, piers, and three long benches down the centre of room, with the usual sinks and benches, &c., along the wall. At one end is a small preparation-room, and at the other end a professors' room communicating with a special laboratory, about 30ft. by 18ft. On the floor above is an elementary physical laboratory, and a lecture room, &c., over the advanced physical laboratory. The whole buildings form a double quadrangle, the open areas being divided by a large laboratory having fourteen benches in two rows, and lighted on both sides; the other rooms are ranged round the outer corridors. For a physical laboratory, plenty of blank wall is necessary for the experimental demonstration of the parallelogram of force theorem, and other manipulations, in which cords and pulleys, and weights, &c., are required. We have spoken at some length on laboratory arrangements and fitting, as they have so important a bearing on technical school architecture. These fittings, in short, become the root or germ of technical school planning, and if we are to have a development arising out of the requirements of technological school building, we must begin by a careful study of the necessary furniture of these buildings. It is for the architect in each case to render these fittings as presentable and pleasing to the eye as their utilitarian nature permits. At present it must be confessed that the architect leaves too much in the hands of the technical fitter, the manufacturer of furniture, and individual taste.

A GLASGOW COLD STORAGE.

MANY correspondents who have written us from time to time lately in search of information on the construction of cold storage stores will be interested in the following particulars of the recently-completed ice and cold stores for Mr. William Milne in Old Wynd, Glasgow.

The buildings have a frontage to Old Wynd 172ft. long, lying north and south. At the north-west corner a wing or extension has been constructed, running backward to Stockwell-street. The extreme width of the buildings is 193ft., and the area covered about 2,500 square yards. The front is 66ft. high, and, though plain, is imposing by its extent. Four stories are visible, but there is also an extensive basement. The buildings are faced with smooth red bricks. At the front there are two entrance doors with arched and ornamented heads and with red freestone dressings. At a point 100ft. from the north end there is a main entrance for carts and conveyances 13ft. wide; and at a point 3ft. 6in. from the south end there is a second entrance gate for conveyances 9ft. wide. The main cartway broadens to 30ft., and is carried through the building for 100ft., nearly to the outer wall. On entering by this cartway from Old Wynd, a cart or a visitor passes immediately over a Pooley weighing machine, the platform of which is set flush with the roadway to allow carts to be weighed. On the right hand of this cartway lies a loading platform 18ft. wide, and to the right of that again stand the ice-making tanks. On the left-hand side there are offices, which are 60ft. by 20ft., then the compressors and driving engines; and, beyond the engine-room, the boiler house. Engines and boilers will be set 4ft. 6in. below the ground level.

A very strong system of construction has been adopted to insure a carrying capacity of 4cwt. per square foot over the entire floor area of the buildings. The main supports other than the walls are four rows of cast-iron columns 14in. in diameter on the ground-floor, which are placed generally 18ft. from centre to centre, seven columns being in each row, and the rows 18ft. apart. The floors are carried by compound steel girders which rest on the columns, each girder for the first-floor consisting of three 12in. by 6in. girders riveted together.

The ground-floor above the basement is formed of concrete 5in. thick of four-to-one composition. This is carried by steel girders 15in. apart. The basement is divided, one part, used for general

storage, being 60ft. by 30ft. Another part has been finished to serve as the ice store, and is 100ft. long by 80ft. wide. The floor will be formed with a foundation bed of concrete 6in. thick, and will be insulated. An air space of 2in. has been left above the concrete formed by the use of battens, and a layer of 1½in. boards covers the battens. Then come 9in. of McNeill's slag wool. The floor is formed of two layers of 1½in. boards with insulating-paper between. Another portion of the basement adjoining the boiler-house is set apart as a coal-store, and will hold about 300 tons. A tank for cooling brine, used for freezing the water in the ice-making cells, will also be placed in the basement.

Refrigeration is produced by the compression of ammonia, the system and machinery of Messrs. L. Sterne and Co., Ltd., Glasgow, being employed for the purpose. The engine-room is 60ft. by 40ft. by 21ft., and has had a bed of four-to-one concrete, 30ft. by 9ft. by 7ft. thick, carefully prepared to afford a foundation for the massive machines which have been introduced. Engines and compressors together are of the standard type, the steam-engine of each set being horizontal, and the two compressors placed vertically above the crankshaft. There are two sets of engines and compressors. Each steam-engine is of 150H.P., and is compound, with cylinders 16in. and 27in. in diameter, and with stroke of 24in., and will be run at about fifty revolutions. The cylinders are arranged "tandem," a 12in. air-pump being in line with them, and being worked by a tail-rod. Corliss cut-off gear is provided, and, ordinarily, will cut off steam at about one-third of stroke. Each crankshaft has a flywheel 12ft. in diameter, weighing seven tons, made in halves, which are bolted together through hub cheeks with 2½in. bolts. The two sets of machines lie side by side, the flywheels being placed on the end of the shafts in one pit so as to come close together in the centre of the sets. The compressors are double-acting, and each machine has a capacity equal to the production of 100 tons of refrigeration per day. Exhaust steam from the engines and the compressed gas is conducted to the respective condensers, which are situated on the roof of the main building. The roof is entirely flat, and has been constructed of sufficient strength to carry a weight of 300 tons. Both the steam and the ammonia condensers are of the exposed atmospheric type, the steam condenser tubes being arranged vertically and the ammonia tubes horizontally. The latter are 2in. in diam. inside and 3in. in thickness, and have a lineal run of 8,100ft. As far as may be required, water for condensing will be drawn from the town supply; but the water, after use on the condensers, will be used for the boilers.

The boiler-house is 60ft. by 40ft. It contains two Lancashire boilers—21ft. by 7ft. 6in.—the two flues of each boiler tapering from 3ft. to 2ft. 6in. Steam is kept at about 150lb. A Green's economiser with ninety-six tubes is used in the main flue, the scrapers being worked by a small horizontal steam engine. A circular brick-built chimneystack, 130ft. high and 11ft. in diameter inside, rises by the boiler-house outside of the main building. The stack was designed by Mr. William Howat, superintendent engineer to Mr. Milne, to fulfil a twofold purpose—the independent fire-brick being carried up for 80ft. inside the chimney, the 3in. air space being in connection with an open flue between the engine-room and the boiler-house, which are thus ventilated.

For pumping water five centrifugal pumps are used. Two 3½in. pumps supply water for the steam condensers, the water, drawn from the town supply in the first instance, being used again and again, and made up from the town mains as required. Two 3in. pumps will supply water to the ammonia condensers, and one is used to circulate warm brine through the wall cavities of the freezing cells in the ice-tanks. The cold brine is circulated by two No. 5 patent drum-pumps. All pumps are driven by electric motors. Electricity is used for lighting the whole establishment, and is generated by machines stationed in the engine-room.

The area of the ground floor set apart as the ice factor is 100ft. long and 60ft. wide, the height of the room being 17ft. Four rows of wood-framed tanks (four tanks being in each row) have been constructed to hold the cells in which the ice is made. Each set of four tanks contains sixty-six cells, in each of which a block of ice weighing 1cwt. can be produced. A partition, however, has been placed in each cell, by which two blocks,

each weighing about 2cwt., will be obtained from each cell. A side cavity has been left in each tank, and a space below the bottom of each set of cells for agitation, Siddeley's plan of side agitation being adopted. The rods and levers are worked by belt, pulley, and gear-wheel connections. The motion of the water in the side cavities is communicated to the water in the cells through small apertures in the bottoms of the cells. A travelling crane capable of lifting 30cwt. has been provided for each of the four rows of tanks for raising the blocks of ice from the cells. The productive capacity of the ice plant at present installed is seventy tons per day. Space, however, has been left for an addition, which will increase the capacity to that of one hundred tons per day.

The three upper floors of the buildings are fitted up as cold stores. Ten rooms have been constructed on each floor of the main building, giving a total of thirty rooms, in addition to the basement, and without including any of the space in the wing of the main building. The passages and rooms will be 11ft. high, and insulation will be effected by the following plan of construction. On the first floor the brick wall will be 2ft. thick. On the inner face of the wall, a 2in. air space will be formed by the use of battens. Then follows a sheathing of 1in. boards, 6½in. patent granulated cork or silicate cotton (both insulating materials being employed in the building), a layer of 1in. boards, sheets of insulating paper, and then a layer of boards 1½in. thick. The inner dividing walls, where there are no bricks, have two layers of boards on each side with paper between, and 6½in. of insulating material as the main body, making 9in. over all. The floors and ceilings of the rooms are formed with a lower stratum of concrete 6in. thick, obtained by filling in between the main girders. On this concrete surface are laid pitchpine joists, 9in. by 3in., the space between the joists being packed with cork or silicate cotton. The final working floor is formed of two layers of tongued and grooved white-pine boards, 1in. thick. About 100 tons of ground cork, obtained direct from Portugal, has been used as principal insulating material, in addition to a considerable quantity of McNeill's slag wool.

The basement, first floor, and second floor rooms are cooled by the direct expansion of the liquid ammonia. The rooms on the top floor are cooled by the circulation of cold air. An air cooler has been constructed on the roof, by which, with the aid of a fan, air can be cooled and circulated through the rooms on the upper floor.

On the first floor, at one end of the building, a ten-stall stable has been formed, to and from which horses will travel by means of a sloping track or stairway.

The stores will accommodate 20,000 tons of food products of the kinds usually placed in cold stores.

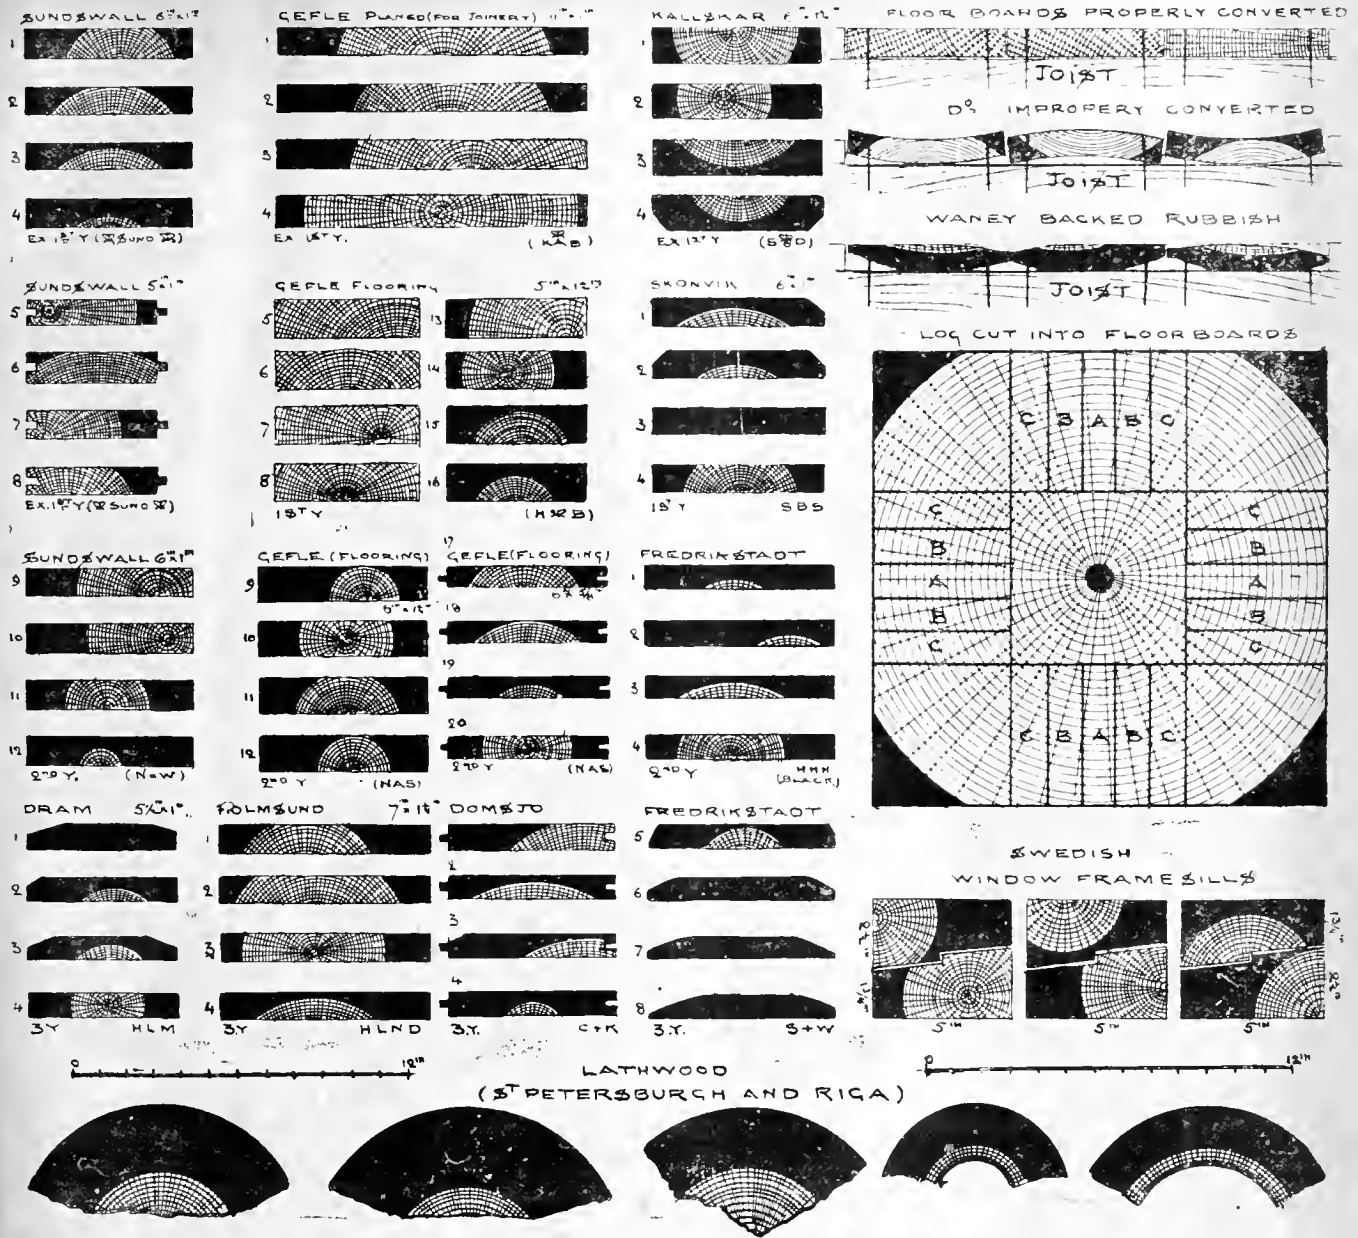

The buildings were erected from plans by Mr. Alexander Adam, architect, Glasgow. The excavating, brick, and stonework were carried out by Messrs. E. and J. Birrell, Glasgow. The installing of the machinery was carried out under the supervision of Mr. William Howat, engineer in charge.

ON BUILDING TIMBERS.—XXXVI.

FLOORING AND MATCHING.

IN the timber trade the expression "flooring" now means floor boarding which has been "prepared" or made ready for laying in a floor without the bestowal of any more labour than that which has been put in it in travelling through a steam-driven planing and thicknessing machine at the rate of close on four miles an hour! Should an architect ask for hand-worked flooring at any timber yard, the proprietor would for a certainty conclude his customer had come straight from Colney Hatch, for such a thing is at present wholly unknown to the trade, and every practical man knows that machined flooring is much better than any that can be worked on a joiner's bench—at least, so he says. Up to 1863, when Mr. Søren Weise, an enterprising Norwegian, took a Perth planing machine over to Fredrikstad, all our floors were laid with hand-prepared boards. Since that time the growth of the "prepared-flooring" trade has been so great and so rapid, almost every Norwegian and Swedish timber port joining in, that one never sees or hears of hand-prepared floor-boards, except in some building where the architect is a "crank" who likes to see his work well done. Indeed, it must be said, in justice to

the timber merchant, that he never laid himself out to prepare flooring, for that work was always done by the builder, who set about it the day the contract was signed. Two uprights and a horizontal piece, something like a "ledger" in scaffolding, made a "perch" on the building site, and this, carefully furnished with roughly-planed boards for the floors, each alternate board being fixed in opposite sides of the perch, made the first erection of a temporary kind which the builder was compelled to carry out by his contract. In those days the specification was worded thus:—"All the flooring boards must be stacked under cover on the site within fifteen days after signing the contract." The necessity for having well-seasoned boards was well understood—much better, in fact, than it is at present, when the specification apparently provides that "all the flooring-boards are to be foreign prepared, listed with sapwood and knots, the whole being carted from the Surrey Commercial Docks the day they are to be laid on the joists." Further on will be seen what kind of flooring is now used here. It has already been stated that two consignments of first quality prepared floor-boarding sent to the writer, one lot from London and the other from Southampton, fell so far short of what he considered decent material that he used both for rough-centring; so that this foreign flooring trade has displaced much good work for what is indifferent or wholly bad. In fact, really good floor-boards cannot be obtained "for love or money." Of course, the truth of this statement depends on what good flooring is. Well, here is a description of it: "A good floor should show no knots or sapwood; the annual rings must be at right angles to the face of the floor, or they shall not vary from a right angle more than 30° with it, and there shall be no open joints three years after the floor is laid." Now where can prepared flooring be obtained which is free from knots and sapwood, and is properly converted from the log, that is cut radially? Echo answers, like that in Paddy B'ake's garden, "No where." Like many other woods used in building, the wood "floor" is ambiguous; it may mean the joists and boarding in a "single-joisted floor"; it may mean the binding, bridging, ceiling joists and boarding of a "double floor"; or it may mean the girders, the three kinds of joists already enumerated, and the boards of a "framed floor." When the "ground floor," "first floor," or any other "floor" of a building is mentioned, the word applies to the whole story without reference to the construction of the actual floor, or the material in it; to prevent misunderstanding the word floor or flooring will be used here to mean floor boarding unless the contrary is stated. Writing from Clifford's Inn on October 14, 1667, one Stephen Primatt, a lawyer, anxious to protect "the noble suffering Citizens and Bees of this nation" from workmen and surveyors, who combined together "to make Harvest in the City Ruins" by taking excessive rates for their works, gives the following information about floorings. He says "every square will take up at the least eleven or twelve boards, they being ten, eleven, or twelve inches broad one with another, and about ten feet long, the rate of such boards you may reckon at seven pounds ten shillings for a hundred, which for every square comes to fifteen shillings; to this you may add four shillings for planing, laying, and for nails and nailing every square, which may be reasonable." All this information is very vague, for Stephen says nothing whatever about the thickness, or what the material is, of the lastly herein before mentioned boards; but he is not the only lawyer who, wading into building affairs, got out of his depth. In 1667, "Yellow Fir," he says, was called "Dram," and it came from "Longlound, Tonsberry, Swinsound, Mosse, Dronton, Bergen, and other places." The timber from these ports was doubled in price after the Great Fire, and deals fourteen or fifteen feet long and fourteen or fifteen inches broad were considered the "most decent for flooring." In 1726 Mr. Leybourn wrote about floor boarding as follows:—"The Price of Laying is Various, according to the Goodness of the Stuff, from 12s to 20s. the Square; but if the Boards be found by the Builder, then they commonly allow for Planing, Jointing, and Laying of Boards, 4s. or 5s. per square, besides Nails, of which 200 is a Competent Allowance for one Square of Flooring. But some Workmen in Sussex tell me they will lay Deal floors braded, and plain Joyns broken at every four or five Boards for 3s. per Square; and if they break

FLOORING, SILLS, AND LATHWOOD.
